OHIO DEPARTMENT OF TRANSPORTATION
INTER-OFFICE COMMUNICATION
Office of Environmental Services

TO: Todd Audit, District 2 Deputy Director
Attn: Stacy Schimmoeller

DATE: April 27, 2015

FROM: Timothy M. Hill, Administrator, Office of Environmental Services

SUBJECT: Phase I Environmental Site Assessment

PROJECT: HEN – New Maumee River Bridge

PID: 22984

This office has reviewed the Phase I Environmental Site Assessment (ESA) reports for the above referenced project prepared by the Mannik & Smith Group, Inc.

Based on the information provided Based on the information provided, we believe recommend the following:

- Sites 6 & 8 – Both locations have been filled with legally deposited fill material and does not warrant further investigation. There is solid waste located on the two properties that should be removed by the current owner or be removed by the contractor during construction,

- Site 11 – It is recommended that this parcel be taken by easement and **not** purchased outright. The Campbell Soup Company has a history of RCRA violations of its hazardous waste storage and handling at the site.

If you have any questions or concerns, please contact Kevin Hodnett, Environmental Specialist, at (614) 466-7925.

EXECUTIVE SUMMARY

This Phase I Environmental Site Assessment (ESA) Report has been prepared in accordance with the April 2009 Environmental Site Assessment Guidelines of the Ohio Department of Transportation's (ODOT's) Office of Environmental Services (OES), to provide site specific information for evaluating the potential to encounter hazardous substances and/or petroleum products within the project study area, as well as developing a list of sites that are recommended for Phase II ESAs.

The proposed project will construct a new bridge spanning the Maumee River at Napoleon in Harrison Township, Henry County, Ohio. The preferred alternative (Alt 2) under consideration will connect Industrial Drive and State Route 424 on the north side of the river with State Route 110 on the south side of the river.

This Phase I ESA encompasses three sites (hereinafter referred to individually as Site No. 6, Site No. 8 and Site No. 11 and referred to collectively as the Sites) recommended for Phase I ESAs located in the immediate vicinity of the proposed new bridge in a mixed commercial, industrial, and agricultural area within Napoleon and Harrison Township in Henry County, Ohio.

MSG reviewed historical ownership records, historical topographic maps, and historical aerial photographs as well as conducted interviews with site representatives where available. Results of these reviews indicate no historical use of petroleum and/or hazardous substances at the Sites.

Base on the results of this investigation, MSG recommends the following for each site:

Site No. 6, Todd A. Rettig, Custodian, Route 424, Parcel No. 28-0700640000
This Site was undeveloped and vacant at the time of the Site investigation; however, a significant amount of fill material consisting primarily of apparent construction demolition debris of undetermined origins and characteristics was observed. A Notice of Intent to Fill (NOIF) was filed with the Henry County Health Department (HCHD) by the Fort Defiance Construction Company on May 20, 2005 for the property addressed at 875 Riverview Drive. This 875 Riverview Drive address is apparently owned by Todd Rettig and though the referenced address is different than the parcel address listed with the Henry County Auditor for Site No. 6, an aerial photograph included with the NOIF suggests that this address includes Site No. 6. The 2005 NOIF does not identify the site of origin for the construction demolition debris, but does identify the 875 Riverview Drive property as the "Todd Rettig Waste Site." Ohio Administrative Code (OAC) Rule 3745-400-05(4) allows for the use of clean hard fill for "legitimate filling operations for construction purposes or to bring the site up to a consistent grade." Visually, the reinforced and unreinforced concrete on Site No. 6 does not appear to have been placed in conjunction with a legitimate filling operation to bring the Site up to a consistent grade and therefore could be construed as the improper disposal of construction demolition debris. Furthermore, no information was provided by either the Ohio EPA or the HCHD that this property has been licensed as a "waste site" for construction demolition debris disposal. In addition, MSG observed one empty above ground storage tank (AST) on the Site.

Project plans presently identify the acquisition of permanent right-of-way in conjunction with this Site. Given the undetermined point of origin, the potential for contaminants to be present within the fill material and the presence of the AST, MSG recommends this Site for a Phase II ESA.

Site No. 8, Todd A. Rettig, Route 424 (rear), Parcel No. 28-0700600000
This Site was undeveloped and vacant at the time of the Site investigation; however, a significant amount of fill material consisting primarily of apparent construction demolition debris of undetermined origins and characteristics was observed. A NOIF was filed with the HCHD on May 20, 2005 for the property addressed at 875 Riverview Drive by Fort Defiance Construction Company. This 875 Riverview Drive address is apparently owned by Todd Rettig and though the referenced address is different than the parcel address listed with the Henry County Auditor, an aerial photograph included with the NOIF suggests that this address includes Site No. 8. The 2005 NOIF does not identify

the site of origin for the construction demolition debris, but does identify the 875 Riverview Drive property as the "Todd Rettig Waste Site." OAC Rule 3745-400-05(4) allows for the use of clean hard fill for "legitimate filling operations for construction purposes or to bring the site up to a consistent grade." Visually, the reinforced and unreinforced concrete on Site No. 8 does not appear to have been placed in conjunction with a legitimate filling operation to bring the Site up to a consistent grade and therefore could be construed as the improper disposal of construction demolition debris. Furthermore, no information was provided by either the Ohio EPA or the HCHD that this property has been licensed as a "waste site" for construction demolition debris disposal. In addition, MSG observed three empty ASTs on the Site, one of which had an attached hose and dispenser nozzle.

Project plans presently identify the acquisition of permanent right-of-way in conjunction with this Site. Based on the potential for contaminants to be present within the fill material and presence of the ASTs, MSG recommends this Site for a Phase II ESA.

Site No. 11, Campbell's Soup Supply Company, State Route 110 and County Road 12, Parcel No. 22-0700040100 et al.

Site No. 11 is a 921.63-acre property consisting of 18 parcels owned by the Campbell's Soup Supply Company. The southwest portion of the Site is comprised of the Campbell's Soup manufacturing plant while the remaining portions of the Site are undeveloped agricultural fields. Project plans presently identify the acquisition of permanent right-of-way in conjunction with Parcel No. 22-0700040100 of this Site, which is an undeveloped agricultural field located northeast of the Campbell's Soup plant. A review of historical aerial photographs indicates that Parcel No. 22-0700040100 has been used for agricultural purposes since at least 1950. Three former 10,000-gallon underground storage tanks (USTs) were removed from the plant complex on the Site circa 1994 and their closure was granted No Further Action (NFA) status by the Bureau of Underground Storage Tank Regulations (BUSTR). A review of available environmental records also indicates that the Campbell's plant was formerly subject to Resource Conservation and Recovery Act (RCRA) corrective actions. Records indicate that both the former USTs and RCRA corrective actions obligations were located in the southwest portion of the Main Plant site, approximately 3,000-feet away from the proposed new bridge project area (Parcel No. 22-0700040100), and both have been addressed to the satisfaction of applicable regulatory programs and agencies.

No further action is recommended in connection with Site No. 11 at this time.

MSG has not received or reviewed any other information or documentation pertaining to releases or potential releases of hazardous or petroleum substances to environmental media that would negatively impact the proposed new bridge project area. Therefore, because of the NFA status of the three former USTs, the clean closure of the RCRA Corrective Action items, and lack of any other documentation of environmental releases, no further action is recommended in conjunction with this Site at this time.

Please note that this Executive Summary is provided as a general overview to conveniently identify recognized environmental conditions associated with the Site. It is not intended as a stand-alone document and does not contain all of the information that is presented within the body of the report. The attached Phase I ESA report should be read in its entirety to obtain a complete understanding of the information provided and to assist you with your plans for the Sites.

1.0 INTRODUCTION

The Henry County Transportation Improvement District (HCTID) authorized a study to evaluate potential environmental concerns associated with the proposed construction of a new crossing of the Maumee River between State Route 424 on the north side of the Maumee River and State Route 110 on the South Side of the Maumee River in Napoleon, Henry County, Ohio. The Mannik & Smith Group, Inc. (MSG) prepared this Phase I Environmental Site Assessment (ESA) report in accordance with the April 2009 *Phase I Environmental Site Assessment Guidelines* of the Ohio Department of Transportation's (ODOT's), Office of Environmental Services (OES) to provide site specific information and determine the potential for encountering hazardous substances and/or petroleum products within the proposed project limits, as well as to make recommendations for further investigations.

The proposed transportation improvement project will construct a new bridge spanning the Maumee River at Napoleon in Harrison Township, Henry County. For many years local officials have recognized the need to better connect the northern and southern halves of the City of Napoleon, which is physically separated by the Maumee River. A single river crossing at State Route 108 currently provides the only direct transportation link between the two halves of the community.

The proposed project includes construction of a new bridge, piers, abutments and associated approaches to the bridge on both sides of the Maumee River. The preferred alternative (Alt 2) under consideration will connect Industrial Drive and State Route 424 on the north side of the river with State Route 110 on the south side of the river (Study Area).

An ESA Screening Report was prepared by MSG for this proposed transportation improvement project in March 2014. In an Inter-office Communication (IOC) dated November 4, 2014 ODOT's OES agreed with MSG's recommendations and requested that Phase I ESAs be completed for the following Sites:

Site No.	Site Address	Site Parcel No.	Concern
6	Route 424 (rear)	28-0700640000	Significant amount of fill materials of undetermined origins and characteristics was observed.
8	State Route 424	28-0700600000	Significant amount of fill materials of undetermined origins and characteristics was observed.
11	State Route 110 and County Road 12	22-0700040100 et al.*	Reportedly, the Site has undertaken Resource Conservation and Recovery Act (RCRA) corrective actions associated with closure/post-closure violations, but the nature and characteristics of the corrective actions are undetermined.

*Note: Site No. 11 is owned by the Campbell's Soup Supply Company and is comprised of 18 Henry County permanent parcels encompassing approximately 922 acres that includes a food manufacturing facility and adjacent fields in agricultural production to the east and northeast. One of the agricultural parcels (Parcel No. 22-0700040100) lies within the Study Area, but the plant and remainder of the agricultural fields lie outside of the Study Area. However, in accordance with ODOT's December 20, 2013 Environmental Update Meeting and an IOC dated January 12, 2015, "a Site is defined as the total assemblage of adjoining and/or contiguous property owned by a single entity." Therefore, while the primary focus of this Phase I ESA is on the portion of Site 11 that lies within the Study area (Parcel 22-0700040100), MSG completed a regulatory file review for the entire Site.

Figure 1, showing the locations of the Sites within the Study Area is provided in Appendix A.

2.0 GEOGRAPHICAL/GEOLOGICAL SETTING OF THE PROJECT STUDY AREA

2.1 Site Location

The proposed project includes the construction of a new bridge crossing the Maumee River at the intersection of Industrial Drive and East Riverview Avenue (State Route 424) north of the river and the intersection of State Route 110 and County Road 12 south of the river. Site Nos. 6 and 8 are located on the south side of State Route 424 between the former Miami-Erie Canal and the Maumee River and can be accessed from East Riverview Avenue (State Route 424). Site No. 11 consists of the Campbell's Soup Supply Company plant located near the intersection of State Route 110 and County Road 12 and can be accessed from both State Route 110 and County Road 12. The project location consists of a mix of primarily rural residential and industrial land uses within the City of Napoleon and Harrison Township in Henry County, Ohio.

2.2 Soils Information

MSG obtained soils information for the project area from the Soil Survey of Henry County, Ohio (United States Department of Agriculture, 1972). Soils on the portion of the Study Area located south of the Maumee River have been identified as belonging to the Millgrove-Mermill-Haskins Association, described as nearly level, very poorly drained and somewhat poorly drained loamy soils formed mainly in water worked material. Soils on the portion of the Study Area located north of the Maumee River have been identified as belonging to the Toledo-Fulton-Lenawee Association, described as nearly level to gently sloping, very poorly drained and somewhat poorly drained soils formed in lacustrine sediment. Specific soil types identified include:

DfA (Del Rey silt loam) – The Del Rey silt loam unit consists of somewhat poorly drained, nearly level (0 to 2 percent slope) soils formed on lake plains from lacustrine deposits.

DuA (Digby fine sandy loam) – The Digby fine sandy loam unit consists of somewhat poorly drained, nearly level (0 to 2 percent slope) soil formed on plains from glaciofluvial deposits over outwash material.

Hla (Haskins loam) – The Haskins loam unit consists of somewhat poorly drained, nearly level (0 to 2 percent slope) soil formed on knolls from glaciolacustrine deposits over basal till.

HoA (Hoytville clay loam) – The Hoytville clay loam unit consists of very poorly drained, nearly level (0 to 1 percent slope) soil formed on drainageways, depressions, or flats from wave-planed Wisconsinan till deposits.

LxC3 (Lucas silty clay) – The Lucas silty clay unit consists of moderately well drained, moderately sloping (6 to 12 percent slope) soil formed on drainageways on lake plains from glaciolacustrine deposits.

Me and Mf (Mermill loam & clay loam) – The Mermill loam and clay loam units consist of very poorly drained, nearly level (0 to 2 percent slope) soil formed on flats on lake plains from glaciolacustrine deposits over basal till.

Mh (Millgrove loam) – The Millgrove loam unit consists of very poorly drained, nearly level (0 to 2 percent slope) soil formed on flats on lake plains from outwash material.

RmA and RfA (Rimer loamy fine sand) – The Rimer loamy fine sand units consist of somewhat poorly drained, nearly level (0 to 2 percent slope) soil formed on lake plains from glaciolacustrine deposits over basal till.

SbC2 (St. Clair silty clay loam) – The St. Clair silty clay loam unit consists of moderately well drained, moderately sloping (6 to 12 percent slope) soil formed on lake plains from wave-planed basal till deposits.

Sh (Shoals silt loam) – The Shoals silt loam unit consists of somewhat poorly drained, nearly level (0 to 2 percent slope) soils formed on flood plains from alluvium material.

TuB2 (Tuscola loam) – The Tuscola loam unit consists of moderately well drained, gently sloping (2 to 6 percent slope) soil formed on lake plains from glaciolacustrine deposits.

Ur (Urban land) – Urban land is a general description for soil types that have been altered due to disturbance, development or other earth moving activities such that the specific soil type and soil horizons are no longer discernible at a specific project area.

2.3 U.S. Geological Survey Topographic Quadrangle Maps

The United States Geological Survey (USGS) 7.5-Minute topographic map for the Napoleon quadrangle (dated 1960, photo revised in 1977) indicates that the Study Area is located in a generally flat portion of Henry County. The general elevation of the Study Area ranges from approximately 640 to 680 feet above mean sea level (msl). The Maumee River is located within the Study Area. The topography of the area implies that shallow groundwater movement is toward the Maumee River. Based on the original map preparation of 1960, the Study Area appears to have been used for a combination of residential and agricultural purposes. Surrounding land use on this map indicates residential, agricultural and manufacturing land uses.

A copy of the appropriate portion of the USGS map is presented as the Study Area Location Map (Figure 1), which is located in Appendix A.

The general locations of all three Sites are able to be identified in the 1908 topographic map, though no specific features are identified. Site Nos. 6 and 8 are located just south of the Miami & Erie Canal, which is just south of the Wabash Railroad. Generally, the 1960 topographic map shows the Study Area in the vicinity of the Sites to be relatively unchanged. A small structure (apparent residence) is depicted on Site No. 8 and the Campbell's Soup Supply Company plant is shown on site No. 11. The 1971 and 1977 topographic maps appear to be generally the same as the map dated 1960 with the exception that additional apparent residential development has occurred north of Site No. 6 and 8. In addition, expansion of the Campbell's Soup plant (Site No. 11) has occurred to the northeast. No manmade structures are depicted on the 2010 and 2013 topographic maps. Otherwise, these maps appear generally the same as the 1977 topographic map. Copies of the historical topographic maps are provided in Appendix B.

2.4 Preliminary Project Mapping and/or Plans

Copies of the most recent preliminary project plans are provided in Appendix C for reference.

2.5 Bedrock Geology and Groundwater Occurrence

The proposed transportation improvement project is located within the Maumee Lake Plains deposits of the Huron-Erie Lake Plains Section of the Central Lowlands Physiographic Province of North America. The

Maumee Lake Plains are characterized as very flat-lying clayey soils resultant from deposition in shallow post-glacial lakes. Topographic relief is generally on the order of five feet or less, except in the vicinity of streams, creeks, and rivers. The project is located in an area where Devonian-age carbonate limestone and shales are overlain by Pleistocene-age silt, clay, and wave-planed clayey till. The uppermost aquifer beneath the project location is generally considered to be contained within the Devonian limestone bedrock at a depth of 48 to 60 feet, though sand and gravel lenses contained within the overlaying glacial till may yield useable quantities of water for finite periods.

The entire area is supplied with potable water by the City of Napoleon, who draws their water from the Maumee River. MSG completed a water well search for the project area on the Ohio Department of Natural Resources (ODNR) website. According to ODNR, one potable water well was identified, at a depth of 69 feet, within a one-half mile radius of the project area.

3.0 SITE OWNERSHIP AND OCCUPANCY INFOMATION

3.1 Title Records

The following tables provide summaries of historical ownership based upon a review of title records readily available at the Henry County Auditor's website, for each Site identified for a Phase I ESA. Copies of parcel information for each Site are provided in Appendix D.

Table 3.1 Summary of Historical Ownership – Site No. 6
Henry County Parcel No. 28-0700640000

Grantor	Grantee	Date	Concern?
Lawrence E. Hoeffel	Todd A. Rettig, Custodian	12/29/2000	No

3.2 City Directories

MSG contacted Historical Information Gatherers (HIG) to obtain historical city directories that cover the Sites. HIG responded that no coverage of the Site is available. A copy of the No Coverage letter is included in Appendix D.

4.0 HISTORICAL MAP AND AERIAL PHOTOGRAPH REVIEW

4.1 Aerial Photographs

MSG contacted HIG to obtain historical aerial photographs that cover the Study Area and adjoining sites at a scale no larger than one inch = 800 feet. MSG reviewed and summarized (below) copies of aerial photographs provided by HIG. Copies of the pertinent aerial photographs are provided in Appendix B.

4.1.1 Summary of Aerial Photograph Review

The following tables provide a summary of our review of historical aerial photographs for the Sites:

Table 4.1 Site Nos. 6 and 8: Parcel Nos. 28-0700640000 and 28-0700600000

Year	Site Features	Adjoining Property Features	Concern?
1950	Site Nos. 6 and 8 have no structures on the property and appear to be riparian woodland along the Maumee River.	A road (State Route 424) is observed along the northwest boundary of the Sites. A railroad is observed approximately 300 feet north of State Route 424. The surrounding area is undeveloped with a predominately agricultural and rural residential land use.	No
1956	No significant changes are observed from the 1950 aerial photograph.	A structure appears to the north of Site No. 6 across State Route 424. No other significant changes are observed from the 1950 aerial photograph.	No
1963	No significant changes are observed from the 1956 aerial photograph.	No significant changes are observed from the 1956 aerial photograph.	No
1971	No significant changes are observed from the 1963 aerial photograph.	Additional residential-size structures appear north of Site No. 6 across State Route 424. Other surrounding properties appear generally unchanged from the 1963 aerial photograph.	No
1980	No significant changes are observed from the 1971 aerial photograph.	A significant amount of apparent industrial / commercial development has occurred along the railroad to the north and northeast of Site No. 6.	No
1989	No significant changes are observed from the 1980 aerial photograph.	No significant changes are observed from the 1980 aerial photograph.	No
1994	No significant changes are observed from the 1989 aerial photograph.	No significant changes are observed from the 1989 aerial photograph.	No
2000	No significant changes are observed from the 1994 aerial photograph.	Additional apparent industrial / commercial development has occurred to the north and northeast of the Sites. Other surrounding properties appear generally unchanged from the 1994 aerial photograph.	No

Year	Site Features	Adjoining Property Features	Concern?
2004	No significant changes are observed from the 2000 photograph.	A small structure appears immediately northwest of Site No. 6 along the Maumee River. Other surrounding properties appear generally unchanged from the 2000 aerial photograph.	No
2009	No significant changes are observed from the 2004 photograph.	No significant changes are observed from the 2004 aerial photograph.	No

Table 4.2 Site No. 11

Year	Site Features	Adjoining Property Features	Concern?
1950	Site No. 11 has an apparent residential-sized structure on the northwest portion of the Site. There is a small patch of woodlands in the southeast portion of the Site. The remainder of the Site appears to be undeveloped agricultural land.	The surrounding area is primarily residential or undeveloped agricultural fields.	No
1956	The Campbell's Soup plant appears on the western portion of the Site. The remainder of the Site appears unchanged from the 1950 aerial photograph.	No other significant changes are observed from the 1950 aerial photograph.	No
1963	Expansion of the Campbell's Soup plant to the northwest has occurred.	No significant changes are observed from the 1956 aerial photograph.	No
1971	Additional expansion of the Campbell's Soup plant to the northeast toward the intersection of State Route 110 and County Road 12 has occurred.	Surrounding properties appear generally unchanged from the 1963 aerial photograph.	No
1980	Three apparent settling ponds or water retention pools appear on the south side of the Site along County Road 12 and Township Road 3.	No significant changes are observed from the 1971 aerial photograph.	No
1989	Additional expansion of the Campbell's Soup plant has occurred on the Site.	Surrounding properties appear generally unchanged from the 1980 aerial photograph.	No
1994	Additional expansion of the Campbell's Soup plant has occurred to the north along State Route 110. An above ground storage tank (AST) is observed immediately adjacent to the northeast of this expansion.	Surrounding properties appear generally unchanged from the 1989 aerial photograph.	No, AST used to store water for the plant's fire suppressant system.
2000	No significant changes are observed from the 1994 photograph.	No significant changes are observed from the 1994 aerial photograph.	
2004	No significant changes are observed from the 2000 photograph.	No significant changes are observed from the 2000 aerial photograph.	
2009	Expansion of the Campbell's Soup plant has occurred toward the intersection of State Route110 and County Road 12.	No significant changes are observed from the 2004 photograph.	

5.0 ENVIRONMENTAL RECORDS REVIEW

5.1 Database Results Summary

MSG reviewed the regulatory database provided by HIG; a total of 54 database entries, associated with 11 properties were identified to be within the recommended search distances relative to the Study Area. Additionally, five entries were listed as unable to be located. However; all of the un-locatable entries appear to be outside of the search radius relative to the Study Area; therefore, they have been removed from further consideration as they are unlikely to affect the Study Area. Additional information about the identified Sites follows. The database report provided by HIG is located in Appendix E.

5.2 Site-Specific Results

Site Nos. 6 and 8 were not identified within the regulatory database.

Site No. 11, located southwest of the intersection of State Route 110 and County Road 12 is owned by the Campbell's Soup Supply Company. The Campbell's Soup Supply Company is listed under 27 database entries which are summarized in Table 5.1 below.

Table 5.1 Summary of Environmental Database Findings

Map ID/Database	Facility Name	Facility Address	Comments	Possible Concern?
7/LUST, UST	Campbell Soup Co.	East Maumee Ave.	Closure of regulated USTs and LUST with no further action (NFA) status.	No, based on the NFA status.
7/ERNSOH	Campbell Soup Co.	12-773 State Route 110 Beverage Plant	Equipment failure released refrigerant gas. Location was not reported. Remedial action taken.	No, based on the remedial action taken and lack of violations or corrective actions.
7/RCRAC	Campbell Soup Supply Co.	12-773 State Route 110	Small quantity generator of hazardous waste with multiple violations subject to corrective action. However, the violations appear to be the result of improper documentation and/or storage of materials, with no release of hazardous materials to environmental media noted.	No, based on the lack of a release of hazardous substances to environmental media.
7/RCRAGR05	Silgan Can Co.	12-773 State Route 110 Suite 1	Large quantity generator of hazardous waste with multiple administrative violations, but not subject to correction action.	No, based on the lack of a release of hazardous substances to environmental media.
7/RCRAGR05	Campbell Soup Supply Co.	12-773 State Route 110	Small quantity generator of hazardous waste with multiple violations subject to corrective action. However, the violations appear to be administrative violations, with no release of hazardous materials to environmental media noted.	No, based on the lack of a release of hazardous substances to environmental media.

5.3 Surrounding Properties Summary

Of the remaining 27 database entries, associated with 10 properties that were identified to be within the recommended search distances relative to the Study Area, none appear likely to impact the Sites based on the inferred direction of groundwater movement toward the Maumee River, as well as the lack of enforcement, violations, or corrective actions and/or the listed NFA status of the Sites.

5.4 Freedom of Information Act (FOIA) Requests

MSG submitted a FOIA request to the Henry County Health Department (HCHD), Bureau of Underground Storage Tank Regulations (BUSTR) and the Ohio Environmental Protection Agency (Ohio EPA).

Copies of our correspondence with the various agencies are included in Appendix F.

5.4.1 Henry County Health Department File Review

Because of the fill materials on Sites 6 and 8, MSG submitted a FOIA request to the HCHD for any records of Notices of Intent to Fill (NOIFs) for these two Sites. There are no street address numbers associated with Sites 6 and 8 in the Henry County Auditor's records. Therefore, MGS's FOIA request to the HCHD included the parcel number for Sites 6 and 8 along with approximate street address numbers (1005 and 899 East Riverview Avenue, respectively) based on surrounding actual property addresses. A response was received on January 15, 2015 from the Director of Environmental Health, Jon Lindsay, indicating they did not have any NOIFs for either of the property addresses listed in the FOIA request. However, the HCDC did provide information related to a NOIF submitted by Fort Defiance Construction Company on May 20, 2005 for a property addressed at 875 Riverview Drive. The NOIF identifies the filling location as the "Todd Rettig Waste Site" and includes a copy of an aerial photograph that encompasses Site Nos. 6 and 8. The NOIF does not identify the point of origin of the intended fill materials, which are described as consisting of "concrete, brick, asphalt concrete, and dirt." A letter from the HCHD acknowledges receipt of the NOIF and suggests that the intended filling may be within a floodplain and that other regulatory agencies may have some authority over the filling operation. No other information was provided.

Copies of our correspondence with the HCHD are included in Appendix F.

5.4.2 Ohio EPA File Review

MSG submitted FOIA requests to the Ohio EPA for any records pertaining to Site Nos. 6, 8 and 11 on November 12, 2014 and January 13, 2015. Responses were received on December 4, 2014 and January 21, 2015 indicating the Ohio EPA did not have any records pertaining to Site Nos. 6 and 8. However, the Ohio EPA provided several records pertaining to the Campbell's Soup plant on Site 11. MSG's review of the files received from the Ohio EPA revealed that the Campbell's Main Plant on Site 11 was subject to RCRA Corrective Action for the following:

- The Main Plant operated as an unpermitted hazardous waste treatment, storage, and disposal (TSD) facility from 1981 through 1983, when semi-solid hazardous wastes (waste coating material used on steel cans as a rust inhibitor) were dumped into a Former Holding Pit Area, allowed to dry and eventually were mixed with sand prior to disposal at a landfill; and
- From approximately 1981 to 1993, the liquid phase of the waste coating material (ignitable solvents) was poured onto a coal pile located on the grounds of the Main Plant and later burned in a boiler for energy recovery.

Both the former Holding Pit Area and former coal storage pile were located in the southwest portion of the Main Plant site, approximately 3,000-feet away from the proposed transportation improvement project area. Closure of the Former Holding Pit Area was conducted in accordance with an approved closure plan and was certified closed on June 11, 2004. In addition, soil sampling beneath the former coal storage pile determined that the soil had not been impacted by the solvent wastes and the violation was terminated by the Ohio EPA in a letter dated December 12, 1994.

No other release or potential release of hazardous substances or petroleum was documented in the files provided by the Ohio EPA.

Copies of our correspondence with the Ohio EPA are included in Appendix F.

5.4.3 BUSTR File Review

MSG submitted FOIA requests to BUSTR on October 31, 2014 and January 15, 2015 for any records pertaining to Site Nos. 6, 8 and 11. On January 30, 2015, BUSTR provided a Closure Report for three, 10,000-gallon USTs that were removed from the Campbell's Soup plant (Site. 11) in 1995. The closure of these USTs was granted NFA status in a letter from BUSTR dated November 13, 1995. No other records pertaining to Site No. 11 and no records pertaining to Site Nos. 6 or 8 were received from BUSTR.

Copies of our correspondence with BUSTR are included in Appendix F.

6.0 SITE INTERVIEWS & RECONNAISANCE

MSG personnel completed a reconnaissance of the Sites recommended for Phase I ESAs on October 28, 2014, and personnel were also on the Sites in November and December 2014. Photographs taken during Site reconnaissance are provided in Appendix G. During the reconnaissance MSG attempted to interview one or more representatives for each Site. Site interview details are also included in the following sections.

6.1 Site No. 6: Rettig, Todd A., Custodian, Route 424 (rear), Parcel No. 28-0700640000

Site No. 6 is a 1.31-acre parcel of undeveloped, vacant land located between the former Miami-Erie Canal and the Maumee River. MSG was not able to interview the owner of the Site. A significant amount of fill materials of undetermined origins and characteristics was observed during the Site reconnaissance. In addition, MSG observed an apparently empty, unlabeled, 275-gallon capacity AST on the site. However, no evidence of staining was observed on the ground surrounding the AST. No evidence of USTs, drums, ponds/lagoons, surface staining, sheen, damaged vegetation or odors was observed at the time of reconnaissance.

Project plans presently identify the acquisition of permanent right-of-way in conjunction with this Site. The adjacent property to the southwest is Site No. 8, which is vacant. South and southeast of the Site is the Maumee River; northeast of the Site is a residence; and northwest of the Site is the former Miami-Erie Canal, beyond which is State Route 424.

6.2 Site No. 8: Rettig, Todd A., Route 424 (rear), Parcel No. 28-0700600000

Site No. 8 is a 1.55-acre parcel of undeveloped, vacant land located between the former Miami-Erie Canal and the Maumee River. MSG was not able to interview the owner of the Site. A significant amount of fill materials of undetermined origins and characteristics was observed during the Site reconnaissance including an unlabeled shipping container, miscellaneous piles of metal piping and construction materials. In addition, MSG observed three apparently empty, unlabeled, 275-gallon capacity ASTs on the site. A hose and dispensing nozzle was connected to one of the ASTs. However, no evidence of staining was observed on the ground surrounding the ASTs. No evidence of USTs, drums, ponds/lagoons, surface staining, sheens, damaged vegetation or odors was observed at the time of reconnaissance.

Project plans presently identify the acquisition of permanent right-of-way in conjunction with this Site. The adjacent property to the northeast is Site No. 6, which is vacant. South and southeast of the Site is the Maumee River; southwest of the Site is vacant, undeveloped land; and northwest of the Site is the former Miami-Erie Canal, beyond which is State Route 424.

6.3 Site No. 11: Campbell's Soup Supply Company, State Route 110 & County Road 12, Parcel No. 22-0700040100 et al.

Site No. 11 is a 921.63-acre property consisting of 18 parcels that make up the Campbell's Soup Supply Company Industrial Complex. The southwest portion of the Site is comprised of the Campbell's Soup plant while the remaining portions of the Site consist primarily of undeveloped agricultural fields. The 26.82-acre undeveloped, agricultural parcel (No. 22-0700040100**)** immediately adjacent to the proposed transportation improvement project is located near the intersection of State Route 110 and County Road 12, and was the focus of MSG's reconnaissance of this Site. No evidence of USTs, drums, landfills, ponds/lagoons, surface staining, sheen, damaged vegetation or odors was observed on Parcel 22-0700040100 at the time of reconnaissance. However, MSG did observe a large AST next to the Campbell's Soup plant along State Route 110 immediately adjacent to the western edge of Parcel 22-0700040100. MSG interviewed Mr. Randy Puckett, Manager, Services and Utilities for the Campbell's Soup plant (Site contact) to obtain Site

information. Mr. Puckett indicated that the AST located on the north side of the plant contain water for the plant's fire suppression system.

7.0 CONCLUSIONS AND RECOMMENDATIONS

7.1 Conclusions

Site No. 6, Todd A. Rettig, Custodian, Route 424, Parcel No. 28-0700640000
This Site was undeveloped and vacant at the time of the Site investigation; however, a significant amount of fill material consisting primarily of apparent construction demolition debris of undetermined origins and characteristics was observed. A NOIF was filed with the HCHD by the Fort Defiance Construction Company on May 20, 2005 for the property addressed at 875 Riverview Drive. This 875 Riverview Drive address is apparently owned by Todd Rettig and though the referenced address is different than the parcel address listed with the Henry County Auditor for Site No. 6, an aerial photograph included with the NOIF suggests that this address encompasses Site No. 6. The 2005 NOIF does not identify the site of origin for the construction demolition debris but does identify the 875 Riverview Drive property as the "Todd Rettig Waste Site." Ohio Administrative Code (OAC) Rule 3745-400-05(4) allows for the use of clean hard fill for "legitimate filling operations for construction purposes or to bring the site up to a consistent grade." Visually, the reinforced and unreinforced concrete on Site No. 6 does not appear to have been placed in conjunction with a legitimate filling operation to bring the site up to a consistent grade and therefore could be construed as the improper disposal of construction demolition debris. Furthermore, no information was provided by either the Ohio EPA or the HCHD that this property has been licensed as a "waste site" for construction demolition debris disposal. In addition, MSG observed one empty AST on the Site.

Project plans presently identify the acquisition of permanent right-of-way in conjunction with this Site. Given the undetermined point of origin, the potential for contaminants to be present within the fill material and the presence of the AST, MSG recommends this Site for a Phase II ESA.

Site No. 8, Todd A. Rettig, Route 424 (rear), Parcel No. 28-0700600000
This Site was undeveloped and vacant at the time of the Site investigation; however, a significant amount of fill materials consisting primarily of apparent construction demolition debris of undetermined origins and characteristics was observed. A NOIF was filed with the HCHD by Fort Defiance Construction Company on May 20, 2005 for the property addressed at 875 Riverview Drive. This 875 Riverview Drive address is apparently owned by Todd Rettig and though the referenced address is different than the parcel address listed with the Henry County Auditor, an aerial photograph included with the NOIF suggests that this address includes Site No. 8. The 2005 NOIF does not identify the site of origin for the construction demolition debris but does identify the 875 Riverview Drive property as the "Todd Rettig Waste Site." Ohio OAC Rule 3745-400-05(4) allows for the use of clean hard fill for "legitimate filling operations for construction purposes or to bring the site up to a consistent grade." Visually, the reinforced and unreinforced concrete on Site No. 8 does not appear to have been placed in conjunction with a legitimate filling operation to bring the site up to a consistent grade and therefore could be construed as the improper disposal of construction demolition debris. Furthermore, no information was provided by either the Ohio EPA or the HCHD that this property has been licensed as a "waste site" for construction demolition debris disposal. In addition, MSG observed three empty ASTs on the Site, one of which had an attached hose and dispenser nozzle.

Project plans presently identify the acquisition of permanent right-of-way in conjunction with this Site. Given the undetermined point of origin, the potential for contaminants to be present within the fill material and the presence of the ASTs, MSG recommends this Site for a Phase II ESA.

Site No. 11, Campbell's Soup Supply Company, State Route 110 and County Road 12, Parcel No. 22-0700040100 et al.

Site No. 11 is a 921.63-acre property consisting of 18 parcels owned by the Campbell's Soup Supply Company. The southwest portion of the Site is comprised of the Campbell's Soup manufacturing plant while the remaining portions of the Site consist predominantly of undeveloped agricultural fields. Project plans presently identify the acquisition of permanent right-of-way in conjunction with Parcel No. 22-0700040100 of this Site, which is an undeveloped agricultural field located northeast of the Campbell's Soup plant. A review of historical aerial photographs indicates that Parcel No. 22-0700040100 has been used for agricultural purposes since at least 1950. Three former 10,000-gallon USTs were removed from the plant complex on the Site circa 1994 and their closure was granted NFA status by BUSTR. A review of available environmental records also indicates that the Campbell's plant was formerly subject to RCRA corrective actions for the following:

- The Main Plant operated as an unpermitted hazardous waste TSD facility from 1981 through 1983, when semi-solid hazardous wastes (waste coating material used on steel cans as a rust inhibitor) were dumped into a Former Holding Pit Area, allowed to dry and eventually were mixed with sand prior to disposal at a landfill; and
- From approximately 1981 to 1993, the liquid phase of the waste coating material (ignitable solvents) was poured onto a coal pile located on the grounds of the Main Plant and later burned in a boiler for energy recovery.

Both the former Holding Pit Area and former coal storage pile were located in the southwest portion of the Main Plant site, approximately 3,000-feet away from the proposed new bridge project area (Parcel No. 22-0700040100). Further, closure of the Former Holding Pit Area was conducted in accordance with an approved closure plan and was certified closed by the Ohio EPA on June 11, 2004. In addition, soil sampling beneath the former coal storage pile determined that the soil had not been impacted by the solvent wastes, and this violation was terminated by the Ohio EPA in a letter dated December 12, 1994.

MSG has not received or reviewed any other information or documentation pertaining to releases or potential releases of hazardous substances or petroleum to environmental media that would negatively impact the proposed new bridge project area. Records indicate that both the former USTs and RCRA corrective actions obligations were located in the southwest portion of the Main Plant site, approximately 3,000-feet away from the proposed new bridge project area (Parcel No. 22-0700040100), and both have been addressed to the satisfaction of applicable regulatory programs and agencies.

No further action is recommended in connection with Site No. 11 at this time.

7.2 Phase II Environmental Site Assessment Scope of Service

MSG's Phase II field investigation will be completed in accordance with common industry standards. MSG proposes that six borings be advanced across Site Nos. 6 and 8 to an anticipated depth of 15 feet below the existing ground surface (bgs), to characterize the nature and extent of the fil materials and to evaluate subsurface conditions for evidence of hazardous substances and/or petroleum associated with the disposal of the fill materials at these Sites. Proposed soil boring locations are provided on Figure 3 (Site No. 6) and Figure 4 (Site No. 8) located in Appendix A. Soil borings are proposed to be distributed as follows:

- Site 6: 3 borings.
- Site 8: 3 borings.

As required, MSG will contact the Ohio Utilities Protection Service (OUPS) prior to any drilling to arrange for existing utilities to be located in an effort to avoid damage. The soil borings will be advanced using a

Geoprobe®. Soil samples will be collected at continuous intervals the entire length of the borehole, and will be field screened using a hand-held flame or photo-ionization detector (FID or PID). In addition, a temporary well will be installed at each boring location to facilitate the collection of grab groundwater samples. Soil and groundwater samples from the borings will subsequently be analyzed for the following constituents:

- Site No. 6 – One soil and one groundwater sample will be collected from each of the three borings and analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and RCRA metals.
- Site No. 8 – One soil and one groundwater sample will be collected from each of the three borings and analyzed for VOCs, SVOCs and RCRA metals.

EXTENSION OF INDUSTRIAL DRIVE OVER THE MAUMEE RIVER. THE PROJECT INCLUDE THE CONSTRUCTION OF A NEW STRUCTURE, NEW ROADWAY FROM RIVERVIEW AVE. TO S.R. 110, THE RECONSTRUCTION OF INDUSTRIAL DR., RIVERVIEW AVE. AND S.R. 110 AND TWO ROUNDABOUTS.

PROJECT EARTH DISTURBED AREA: 8.10 ACRES
ESTIMATED CONTRACTOR EARTH DISTURBED AREA: 1.80 ACRES
NOTICE OF INTENT EARTH DISTURBED AREA: 9.90 ACRES

I HEREBY APPROVE THESE PLANS AND DECLARE THAT THE MAKING OF THIS IMPROVEMENT WILL REQUIRE THE PART TIME CLOSING OF THE HIGHWAY TO TRAFFIC, AS NOTED ON SHEET . DURING WHICH TIME DETOURS WILL BE PROVIDED AS SHOWN HEREIN. PROVISIONS FOR THE MAINTENANCE AND SAFETY OF TRAFFIC WILL BE AS SET FORTH ON THE PLANS AND ESTIMATES.

2013 SPECIFICATIONS

THE STANDARD SPECIFICATIONS OF THE STATE OF OHIO, DEPARTMENT OF TRANSPORTATION, INCLUDING CHANGES AND SUPPLEMENTAL SPECIFICATIONS LISTED IN THE PROPOSAL SHALL GOVERN THIS IMPROVEMENT.

ROUNDING

THE ROUNDING AT SLOPE BREAKPOINTS SHOWN ON THE TYPICAL SECTIONS APPLIES TO ALL CROSS-SECTIONS EVEN THOUGH OTHERWISE SHOWN.

UTILITIES

THE LOCATION OF THE UNDERGROUND UTILITIES SHOWN ON THE PLANS ARE AS OBTAINED FROM THE OWNERS AS REQUIRED BY SECTION 153.64 O.R.C.

UTILITY OWNERSHIP

LISTED BELOW ARE ALL UTILITIES LOCATED WITHIN THE PROJECT CONSTRUCTION LIMITS TOGETHER WITH THEIR RESPECTIVE OWNERS:

TIME WARNER CABLE

CITY OF NAPOLEON
255 WEST RIVERVIEW
NAPOLEON, OH 43545
(419) 592-4010

OHIO GAS
335 E. LEGGETT STREET
WASEON, OH 43567
(419) 825-5368

TOLEDO EDISON
300 MADISON AVENUE
TOLEDO, OH 43652
(419)249-5218

CENTURY LINK
812 DOLAN ST.
DEFIANCE, OH 43512

SURVEYING PARAMETERS

PRIMARY PROJECT CONTROL MONUMENTS GOVERN ALL POSITIONING ON ODOT PROJECTS. SEE SHEET ___ OF THE PLANS FOR A TABLE CONTAINING PROJECT CONTROL INFORMATION.

USE THE FOLLOWING PROJECT CONTROL, VERTICAL POSITIONING, AND HORIZONTAL POSITIONING PARAMETERS FOR ALL SURVEYING:

PROJECT CONTROL

POSITIONING METHOD: ODOT VRS
MONUMENT TYPE: CORS STATIONS

VERTICAL POSITIONING

ORTHOMETRIC HEIGHT DATUM: NAVD 88
GEOID: GEOID9

HORIZONTAL POSITIONING

REFERENCE FRAME: NAD83 (CORS96)
ELLIPSOID: GRS 80
MAP PROJECTION: LAMBERT CONFORMAL CONIC
COORDINATE SYSTEM: OHIO STATE PLANE - NORTH ZONE
COMBINED SCALE FACTOR: 1.0000675074
ORIGIN OF COORDINATE
SYSTEM: 0.00, 0.00

SURVEYING PARAMETERS (CONT.)

USE THE POSITIONING METHODS AND MONUMENT TYPE USED IN THE ORIGINAL SURVEY TO RESTORE ALL MONUMENTS RELATED TO PRIMARY PROJECT CONTROL THAT ARE DAMAGED OR DESTROYED BY CONSTRUCTION ACTIVITIES. RESTORE THE DAMAGED OR DESTROYED MONUMENTS IN ACCORDANCE WITH SUPPLEMENTAL SPECIFICATION 823.

UNITS ARE IN U.S. SURVEY FEET. USE THE FOLLOWING CONVERSION FACTOR: 1 METER = 3.280833333 U.S. SURVEY FEET.

HIG Research Summary

Site Location:
Napoleon, OH

HIG Project #:
149200

Research Summary Completed:
10/30/2014

Historical Information Gatherers

Conducted For:
Mannik & Smith Group, Inc.
1800 Indian Wood Circle
Maumee, OH

This Research Summary identifies the products and services ordered from Historical Information Gatherers, Inc. (HIG) for the above referenced site location.

City Directory Pages

A search was conducted for directories that include coverage of the site area. This included researching one or more of the following: HIG's City Directory Collection, the Allen County (Indiana) Public Library's city directory collection, the Library of Congress Business Reference Services Collection and other miscellaneous online sources.

No city directories for the site area were identified.

Topographic Maps

USGS Topographic Maps published in the years listed below were provided for the site location. Title blocks on each page list the map title, year and scale of the publication.

1908, 1960, 1971, 1977, 2010, 2013

GeoSearch (GS) Database Report

The Preliminary GS Database Report was delivered via email shortly after ordering to provide the approximate locations of database listings in the site area. A final Database Report was issued after verification and correction of database listing locations.

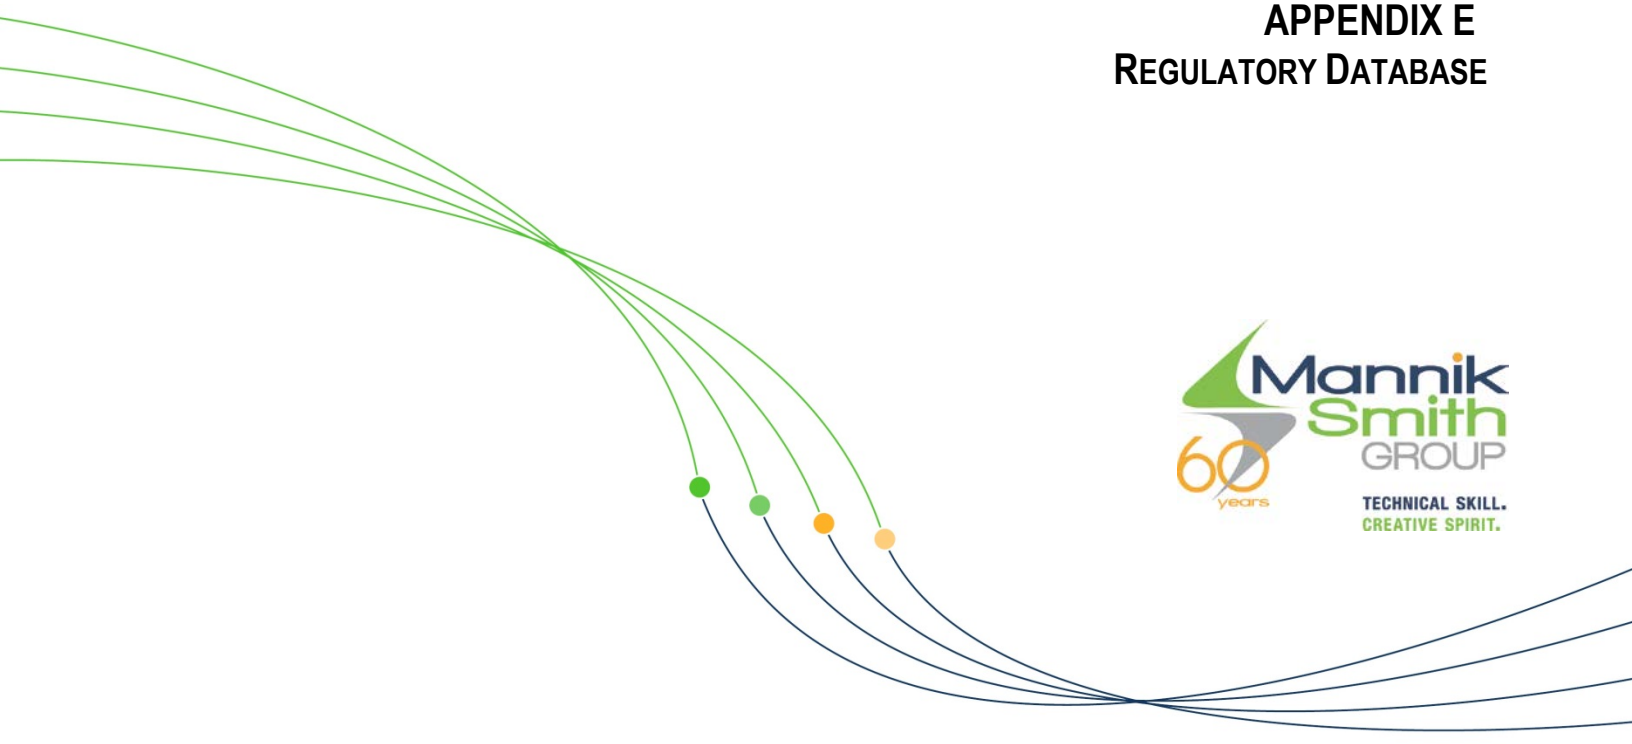
Disclaimer & Waiver of Liability

This Research Summary and the related documents and images provided by Historical Information Gatherers (hereafter referred to as the "Site Specific HIG Data") contain information obtained from a variety of public and private sources. Additional information for the site and surrounding properties may exist. Accordingly, there can be no guaranty that the information provided is complete for its intended purpose. No warranty expressed or implied, is made whatsoever in connection with the Site Specific HIG Data. Historical Information Gatherers specifically disclaims the making of any such warranties, including without limitation, merchantability or fitness for a particular purpose. Historical Information Gatherers, its officers, employees and independent contractors cannot be held liable to anyone for any loss or damage, whether arising out of errors or omissions, negligence, accident or any other cause, resulting directly or indirectly from any information provided or any information not provided in the Site Specific HIG Data. Any liability on the part of Historical Information Gatherers is strictly limited to a refund equal to the amount paid for the Site Specific HIG Data.



HIG Copyright Notice

Copyright 2014 by Historical Information Gatherers, Inc. All rights reserved. The person or entity that ordered and paid for the Site Specific HIG Data is granted a limited license to reproduce the Site Specific HIG Data solely for purposes of providing supporting documentation for reports produced for the site location which is noted on page one of this Research Summary. Any other reproduction of the Site Specific HIG Data in any media or format, in whole or in part, is prohibited without prior written permission from Historical Information Gatherers.

Licensing Agreement

The licensing agreement between Historical Information Gatherers and infoGroup provides that Historical Information Gatherers may create photocopies or reproductions of portions of Polk City Directories, Hill-Donnelley Criss-Cross Directories and other directories under infoGroup copyright. The licensing agreement also permits the person or entity that ordered and paid for the Site Specific HIG Data to include photocopies or reproductions of portions of Polk City Directories, Hill-Donnelley Criss-Cross Directories and other directories under infoGroup copyright as supporting documents for reports produced for the site which is the subject of the Site Specific HIG Data.

Disclaimer

This report was designed by GeoSearch to meet or exceed the records search requirements of the All Appropriate Inquires Rule (40 CFR §312.26) and the current version of the ASTM International E1527, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process or, if applicable, the custom requirements requested by the entity that ordered this report. The records and databases of records used to compile this report were collected from various federal,state and local governmental entities. It is the goal of GeoSearch to meet or exceed the 40 CFR §312.26 and E1527 requirements for updating records by using the best available technology. GeoSearch contacts the appropriate governmental entities on a recurring basis. Depending on the frequency with which a record source or database of records is updated by the governmental entity, the data used to prepare this report may be updated monthly, quarterly, semi-annually, or annually.

The information provided in this report was obtained from a variety of public sources. GeoSearch cannot ensure and makes no warranty or representation as to the accuracy, reliability, quality, errors occurring from data conversion or the customer's interpretation of this report. This report was made by GeoSearch for exclusive use by its clients only. Therefore, this report may not contain sufficient information for other purposes or parties. GeoSearch and its partners, employees, officers And independent contractors cannot be held liable For actual, incidental, consequential, special or exemplary damages suffered by a customer resulting directly or indirectly from any information provided by GeoSearch.

MAP ID# 7 **Distance from Property: 0.21 mi. SE**

SITE INFORMATION

UNIQUE ID: **43633**
PLANT ID: **43633**
NAME: **CAMPBELL SOUP COMPANY**
ADDRESS: **CAMPBELL SOUP COMPANY LLC**
NAPOLEON, OH 43545
CLASSIFICATION: **ACTUAL OR POTENTIAL EMISSIONS ARE ABOVE THE APPLICABLE MAJOR SOURCE THRESHOLDS.**
OPERATION STATUS: **OPERATING**
STATE COMPLIANCE STATUS: **IN COMPLIANCE (AUTO-GENERATED)**
FACILITY TYPE: **PRIVATELY OWNED/OPERATED**
CURRENT HIGH PRIORITY VIOLATOR: **NOT REPORTED**
SIC DESCRIPTION: **ESTABLISHMENTS PRIMARILY ENGAGED IN CANNING SPECIALTY PRODUCTS, SUCH AS BABY FOODS, NATIONALITY SPECIALTY FOODS, AND SOUPS, EXCEPT SEAFOOD.**

Environmental Records Definitions - FEDERAL

AIRSAFS Aerometric Information Retrieval System / Air Facility Subsystem

VERSION DATE: 04/28/14

The United States Environmental Protection Agency (EPA) modified the Aerometric Information Retrieval System (AIRS) to a database that exclusively tracks the compliance of stationary sources of air pollution with EPA regulations: the Air Facility Subsystem (AFS). Since this change in 2001, the management of the AIRS/AFS database was assigned to EPA's Office of Enforcement and Compliance Assurance.

BF Brownfields Management System

VERSION DATE: 04/15/14

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. The United States Environmental Protection Agency maintains this database to track activities in the various brown field grant programs including grantee assessment, site cleanup and site redevelopment.

BRS Biennial Reporting System

VERSION DATE: 12/31/11

The United States Environmental Protection Agency (EPA), in cooperation with the States, biennially collects information regarding the generation, management, and final disposition of hazardous wastes regulated under the Resource Conservation and Recovery Act of 1976 (RCRA), as amended. The Biennial Report captures detailed data on the generation of hazardous waste from large quantity generators and data on waste management practices from treatment, storage and disposal facilities. Currently, the EPA states that data collected between 1991 and 1997 was originally a part of the defunct Biennial Reporting System and is now incorporated into the RCRAInfo data system.

CDL Clandestine Drug Laboratory Locations

VERSION DATE: 09/06/13

The U.S. Department of Justice ("the Department") provides this information as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments. The Department does not establish, implement, enforce, or certify compliance with clean-up or remediation standards for contaminated sites; the public should contact a state or local health department or environmental protection agency for that information.

CERCLIS Comprehensive Environmental Response, Compensation & Liability Information System

VERSION DATE: 10/25/13

CERCLIS is the repository for site and non-site specific Superfund information in support of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). This United States Environmental Protection Agency database contains an extract of sites that have been investigated or are in the process of being investigated for potential environmental risk.

DNPL Delisted National Priorities List

VERSION DATE: 10/25/13

This database includes sites from the United States Environmental Protection Agency's Final National Priorties List (NPL) where remedies have proven to be satisfactory or sites where the original analyses were inaccurate, and the site is no longer appropriate for inclusion on the NPL, and final publication in the Federal Register has occurred.

DOCKETS EPA Docket Data

VERSION DATE: 12/22/05

The United States Environmental Protection Agency Docket data lists Civil Case Defendants, filing dates as far back as 1971, laws broken including section, violations that occurred, pollutants involved, penalties assessed and superfund awards by facility and location. Please refer to ICIS database as source of current data.

DOD Department of Defense Sites

VERSION DATE: 12/01/05

This information originates from the National Atlas of the United States Federal Lands data, which includes lands owned or administered by the Federal government. Army DOD, Army Corps of Engineers DOD, Air Force DOD, Navy DOD and Marine DOD areas of 640 acres or more are included.

EC Federal Engineering Institutional Control Sites

VERSION DATE: 01/14/14

This database includes site locations where Engineering and/or Institutional Controls have been identified as part of a selected remedy for the site as defined by United States Environmental Protection Agency official remedy decision documents. A site listing does not indicate that the institutional and engineering controls are currently in place nor will be in place once the remedy is complete; it only indicates that the decision to include either of them in the remedy is documented as of the completed date of the document. Institutional controls are actions, such as legal controls, that help minimize the potential for human exposure to contamination by ensuring appropriate land or resource use. Engineering controls include caps, barriers, or other device engineering to prevent access, exposure, or continued migration of contamination.

ERNSOH Emergency Response Notification System

VERSION DATE: 07/27/14

This National Response Center database contains data on reported releases of oil, chemical, radiological, biological, and/or etiological discharges into the environment anywhere in the United States and its territories. The data comes from spill reports made to the U.S. Environmental Protection Agency, U.S. Coast Guard, the National Response Center and/or the U.S. Department of Transportation.

FRSOH Facility Registry System

VERSION DATE: 08/04/13

The United States Environmental Protection Agency's Office of Environmental Information (OEI) developed the Facility Registry System (FRS) as the centrally managed database that identifies facilities, sites or places subject to environmental regulations or of environmental interest. The Facility Registry System replaced the Facility Index System or FINDS database.

FUDS Formerly Used Defense Sites

VERSION DATE: 06/01/14

The 2012 Formerly Used Defense Sites (FUDS) inventory includes properties previously owned by or leased to the United States and under Secretary of Defense Jurisdiction, as well as Munitions Response Areas (MRAs). The remediation of these properties is the responsibility of the Department of Defense. This data is provided by the U.S. Army Corps of Engineers (USACE), the boundaries/polygon data are based on preliminary findings and not all properties currently have polygon data available. DISCLAIMER: This data represents the results of data collection/processing for a specific USACE activity and is in no way to be considered comprehensive or to be used in any legal or official capacity as presented on this site. While the USACE has made a reasonable effort to insure the accuracy of the maps and associated data, it should be explicitly noted that USACE makes no warranty, representation or guaranty, either expressed or implied, as to the content, sequence, accuracy, timeliness or completeness of any of the data provided herein. For additional information on Formerly Used Defense Sites please contact the USACE Public Affairs Office at (202) 528-4285.

HISTPST Historical Gas Stations

VERSION DATE: 07/01/30

This historic directory of service stations is provided by the Cities Service Company. The directory includes Cities Service filling stations that were located throughout the United States in 1930.

HMIRSR05 Hazardous Materials Incident Reporting System

VERSION DATE: 01/10/14

The HMIRS database contains unintentional hazardous materials release information reported to the U.S. Department of Transportation located in EPA Region 5. Region 5 includes the following states: Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin.

ICIS Integrated Compliance Information System (formerly DOCKETS)

VERSION DATE: 08/01/12

ICIS is a case activity tracking and management system for civil, judicial, and administrative federal Environmental Protection Agency enforcement cases. ICIS contains information on federal administrative and federal judicial cases under the following environmental statutes: the Clean Air Act, the Clean Water Act, the Resource Conservation and Recovery Act, the Emergency Planning and Community Right-to-Know Act - Section 313, the Toxic Substances Control Act, the Federal Insecticide, Fungicide, and Rodenticide Act, the Comprehensive Environmental Response, Compensation, and Liability Act, the Safe Drinking Water Act, and the Marine Protection, Research, and Sanctuaries Act.

ICISNPDES Integrated Compliance Information System National Pollutant Discharge Elimination System

VERSION DATE: 08/01/12

In 2006, the Integrated Compliance Information System (ICIS) - National Pollutant Discharge Elimination System (NPDES) became the NPDES national system of record for select states, tribes and territories. ICIS-NPDES is an information management system maintained by the United States Environmental Protection Agency's Office of Compliance to track permit compliance and enforcement status of facilities regulated by the NPDES under the Clean Water Act. ICIS-NPDES is designed to support the NPDES program at the state, regional, and national levels.

LUCIS Land Use Control Information System

VERSION DATE: 09/01/06

The LUCIS database is maintained by the U.S. Navy and contains information for former Base Realignment and Closure (BRAC) properties across the United States.

MLTS Material Licensing Tracking System

VERSION DATE: 01/30/13

MLTS is a list of approximately 8,100 sites which have or use radioactive materials subject to the United States Nuclear Regulatory Commission (NRC) licensing requirements.

NCDBC National Compliance Database System

VERSION DATE: 09/01/06

NCDB is the historical repository for national data from the United States Environmental Protection Agency's ten regional and Headquarters FIFRA/TSCA Tracking System (FTTS). Data collected in the regional FTTS was transferred to NCDB to support the need for monitoring national performance of the following programs: Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), Toxic Substance Control Act (TSCA) , Emergency Planning and Right-to-Know Act, Section 313 (EPCRA) , Asbestos Hazard Emergency Response (AHERA) . NCDBC contains administrative case listings. Since October 2006, the EPA has been entering new case information into

the Integrated Compliance Information System (ICIS). Please refer to ICIS as the current system of record for this data.

NCDBI National Compliance Database System

VERSION DATE: 09/01/06

NCDB is the historical repository for national data from the United States Environmental Protection Agency's ten regional and Headquarters FIFRA/TSCA Tracking System (FTTS). Data collected in the regional FTTS was transferred to NCDB to support the need for monitoring national performance of the following programs: Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), Toxic Substance Control Act (TSCA) , Emergency Planning and Right-to-Know Act, Section 313 (EPCRA) , Asbestos Hazard Emergency Response (AHERA) . NCDBI contains facility inspection information. Since October 2006, the EPA has been entering new inspection information into the Integrated Compliance Information System (ICIS). Please refer to ICIS as the current system of record for this data.

NFRAP No Further Remedial Action Planned Sites

VERSION DATE: 10/25/13

This database includes sites which have been determined by the United States Environmental Protection Agency, following preliminary assessment, to no longer pose a significant risk or require further activity under CERCLA. After initial investigation, no contamination was found, contamination was quickly removed or contamination was not serious enough to require Federal Superfund action or NPL consideration.

NLRRCRAC No Longer Regulated RCRA Corrective Action Facilities

VERSION DATE: 04/10/14

This database includes RCRA Corrective Action facilities that are no longer regulated by the United States Environmental Protection Agency or do not meet other RCRA reporting requirements.

NLRRCRAG No Longer Regulated RCRA Generator Facilities

VERSION DATE: 04/10/14

This database includes RCRA Generator facilities that are no longer regulated by the United States Environmental Protection Agency or do not meet other RCRA reporting requirements. This listing includes facilities that formerly generated hazardous waste.
Large Quantity Generators: Generate 1,000 kg or more of hazardous waste during any calendar month; or Generate more than 1 kg of acutely hazardous waste during any calendar month; or Generate more than 100 kg of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, or acutely hazardous waste during any calendar month; or Generate 1 kg or less of acutely hazardous waste during any calendar month, and accumulate more than 1kg of acutely hazardous waste at any time; or Generate 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month, and accumulated more than 100 kg of that material at any time.

Small Quantity Generators: Generate more than 100 and less than 1000 kilograms of hazardous waste during any calendar month and accumulate less than 6000 kg of hazardous waste at any time; or Generate 100 kg or less of hazardous waste during any calendar month, and accumulate more than 1000 kg of hazardous waste at any time.
Conditionally Exempt Small Quantity Generators: Generate 100 kilograms or less of hazardous waste per calendar month, and accumulate 1000 kg or less of hazardous waste at any time; or Generate one kilogram or less of acutely hazardous waste per calendar month, and accumulate at any time: 1 kg or less of acutely hazardous waste; or 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, or acutely hazardous waste; or Generate 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, or acutely hazardous waste during any calendar month, and accumulate at any time: 1 kg or less of acutely hazardous waste; or 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste.

NLRRCRAT No Longer Regulated RCRA Non-CORRACTS TSD Facilities

VERSION DATE: 04/10/14

This database includes RCRA Non-Corrective Action TSD facilities that are no longer regulated by the United States Environmental Protection Agency or do not meet other RCRA reporting requirements. This listing includes facilities that formerly treated, stored or disposed of hazardous waste.

NPDESR05 National Pollutant Discharge Elimination System

VERSION DATE: 04/01/07

Information in this database is extracted from the Water Permit Compliance System (PCS) database which is used by United States Environmental Protection Agency to track surface water permits issued under the Clean Water Act. This database includes permitted facilities located in EPA Region 5. This region includes the following states: Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin. The NPDES database was collected from December 2002 until April 2007. Refer to the PCS and/or ICIS-NPDES database as source of current data.

NPL National Priorities List

VERSION DATE: 10/25/13

This database includes United States Environmental Protection Agency (EPA) National Priorities List sites that fall under the EPA's Superfund program, established to fund the cleanup of the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action.

ODI Open Dump Inventory

VERSION DATE: 06/01/85

The open dump inventory was published by the United States Environmental Protection Agency. An “open dump” is defined as a facility or site where solid waste is disposed of which is not a sanitary landfill which meets the

criteria promulgated under section 4004 of the Solid Waste Disposal Act (42 U.S.C. 6944) and which is not a facility for disposal of hazardous waste. This inventory has not been updated since June 1985.

PADS PCB Activity Database System

VERSION DATE: 06/01/13

The PCB Activity Database System (PADS) is used by the United States Environmental Protection Agency to monitor the activities of polychlorinated biphenyls (PCB) handlers.

PCSR05 Permit Compliance System

VERSION DATE: 08/01/12

The Permit Compliance System is used in tracking enforcement status and permit compliance of facilities controlled by the National Pollutant Discharge Elimination System (NPDES) under the Clean Water Act and is maintained by the United States Environmental Protection Agency's Office of Compliance. PCS is designed to support the NPDES program at the state, regional, and national levels. This database includes permitted facilities located in EPA Region 5. This region includes the following states: Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin.

PNPL Proposed National Priorities List

VERSION DATE: 10/25/13

This database contains sites proposed to be included on the National Priorities List (NPL) in the Federal Register. The United States Environmental Protection Agency investigates these sites to determine if they may present long-term threats to public health or the environment.

RCRAC Resource Conservation & Recovery Act - Corrective Action Facilities

VERSION DATE: 04/10/14

This database includes hazardous waste sites listed with corrective action activity in the RCRAInfo system. The Corrective Action Program requires owners or operators of RCRA facilities (or treatment, storage, and disposal facilities) to investigate and cleanup contamination in order to protect human health and the environment. The United States Environmental Protection Agency defines RCRAInfo as the comprehensive information system which provides access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS).

RCRAGR05 Resource Conservation & Recovery Act - Generator Facilities

VERSION DATE: 04/10/14

This database includes sites listed as generators of hazardous waste (large, small, and exempt) in the RCRAInfo

system. The United States Environmental Protection Agency defines RCRAInfo as the comprehensive information system which provides access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). This database includes sites located in EPA Region 5. This region includes the following states: Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin.
Large Quantity Generators: Generate 1,000 kg or more of hazardous waste during any calendar month; or Generate more than 1 kg of acutely hazardous waste during any calendar month; or Generate more than 100 kg of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, or acutely hazardous waste during any calendar month; or Generate 1 kg or less of acutely hazardous waste during any calendar month, and accumulate more than 1kg of acutely hazardous waste at any time; or Generate 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month, and accumulated more than 100 kg of that material at any time.
Small Quantity Generators: Generate more than 100 and less than 1000 kilograms of hazardous waste during any calendar month and accumulate less than 6000 kg of hazardous waste at any time; or Generate 100 kg or less of hazardous waste during any calendar month, and accumulate more than 1000 kg of hazardous waste at any time.
Conditionally Exempt Small Quantity Generators: Generate 100 kilograms or less of hazardous waste per calendar month, and accumulate 1000 kg or less of hazardous waste at any time; or Generate one kilogram or less of acutely hazardous waste per calendar month, and accumulate at any time: 1 kg or less of acutely hazardous waste; or 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, or acutely hazardous waste; or Generate 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, or acutely hazardous waste during any calendar month, and accumulate at any time: 1 kg or less of acutely hazardous waste; or 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste.

RCRANGR05 Resource Conservation & Recovery Act - Non-Generator Facilities

VERSION DATE: 04/10/14

This database identifies RCRAInfo system sites that only handle hazardous waste, such as transporters, without generating any amount hazardous waste. The United States Environmental Protection Agency defines RCRAInfo as the comprehensive information system which provides access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). This database includes sites located in EPA Region 5. This region includes the following states: Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin.

RCRASC RCRA Sites with Controls

VERSION DATE: 01/14/14

This list of Resource Conservation and Recovery Act sites with institutional controls in place is provided by the

U.S. Environmental Protection Agency.

RCRAT Resource Conservation & Recovery Act - Treatment, Storage & Disposal Facilities

VERSION DATE: 04/10/14

This database includes Non-Corrective Action sites listed as treatment, storage and/or disposal facilities of hazardous waste in the RCRAInfo system. The United States Environmental Protection Agency defines RCRAInfo as the comprehensive information system which provides access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS).

RODS Record of Decision System

VERSION DATE: 07/01/13

These decision documents maintained by the United States Environmental Protection Agency describe the chosen remedy for NPL (Superfund) site remediation. They also include site history, site description, site characteristics, community participation, enforcement activities, past and present activities, contaminated media, the contaminants present, and scope and role of response action.

SFLIENS CERCLIS Liens

VERSION DATE: 06/08/12

A Federal CERCLA ("Superfund") lien can exist by operation of law at any site or property at which United States Environmental Protection Agency has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties. This database contains those CERCLIS sites where the Lien on Property action is complete.

SSTS Section Seven Tracking System

VERSION DATE: 12/31/09

The United States Environmental Protection Agency tracks information on pesticide establishments through the Section Seven Tracking System (SSTS). SSTS records the registration of new establishments and records pesticide production at each establishment. The Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) requires that production of pesticides or devices be conducted in a registered pesticide-producing or device-producing establishment. ("Production" includes formulation, packaging, repackaging, and relabeling.)

TRI Toxics Release Inventory

VERSION DATE: 12/31/12

The Toxics Release Inventory, provided by the United States Environmental Protection Agency, includes data on

toxic chemical releases and waste management activities from certain industries as well as federal facilities. This inventory contains information about the types and amounts of toxic chemicals that are released each year to the air, water, and land as well as information on the quantities of toxic chemicals sent to other facilities for further waste management.

TSCA Toxic Substance Control Act Inventory

VERSION DATE: 12/31/06

The Toxic Substances Control Act (TSCA) was enacted in 1976 to ensure that chemicals manufactured, imported, processed, or distributed in commerce, or used or disposed of in the United States do not pose any unreasonable risks to human health or the environment. TSCA section 8(b) provides the United States Environmental Protection Agency authority to "compile, keep current, and publish a list of each chemical substance that is manufactured or processed in the United States." This TSCA Chemical Substance Inventory contains non-confidential information on the production amount of toxic chemicals from each manufacturer and importer site.

Environmental Records Definitions - STATE (OH)

AIRS Permit by Rule Air Facilities

VERSION DATE: 09/18/14

A permit-by-rule is a specific permit provision in the Ohio Administrative Code that applies to certain types of low-emitting air pollution sources. This active list of Permit by Rule facilities is provided by the Ohio Environmental Protection Agency.

BF Brownfield Inventory Database

VERSION DATE: 10/01/14

The Ohio Environmental Protection Agency maintains this inventory of brownfield properties. Most of the properties contained in the inventory have received funding through either the Clean Ohio Assistance Fund or Clean Ohio Revitalization Fund. There are also some properties listed that have received funding through U.S. EPA's Brownfield Grants. In addition, cities, counties, townships, villages and private property owners are encouraged to list their brownfield properties on this Inventory.

DERRIC Institutional Controls

VERSION DATE: 03/07/14

This list contains sites with institutional controls in place tracked within the Division of Emergency & Remedial Response (DERR) database. This data is provided by the Ohio Environmental Protection Agency.

DERRUSD Urban Setting Designations

VERSION DATE: 09/04/14

This list of Urban Setting Designations (USD) tracked within the Division of Emergency & Remedial Response database is provided by the Ohio Environmental Protection Agency (Ohio EPA). According to the Ohio EPA, for some areas in Ohio with urban land use, ground water is not relied upon as a potable water supply since alternative community water systems supply residents with safe drinking water; therefore, potentially contaminated ground water poses no potable use risk to the community. USD areas utilize voluntary actions to protect humans and ecological receptors from any exposures including exposures to ground water not related to drinking, showering, bathing, or cooking.

LUST Leaking Underground Storage Tank Facilities

VERSION DATE: 09/17/14

The Bureau of Underground Storage Tank Regulations (BUSTR), a bureau of the State of Ohio Fire Marshal's office of the Ohio Department of Commerce, maintains this database of facilities with active releases from regulated tanks. On March 30, 1987, the State Fire Marshal created BUSTR to develop the underground storage tank program and to administer the federal Leaking Underground Storage Tank Trust Fund. BUSTR is financed through a combination a federal grants in combination with annual registration fees and permit fees. BUSTR's mission is to effectively regulate the safe operation of underground storage tanks and to ensure

appropriate investigation and cleanup of releases from underground storage tanks for the purpose of protecting human health and the environment for the citizens of Ohio.

NPDES National Pollutant Discharge Elimination System Permits

VERSION DATE: 09/18/14

This database contains facilities with National Pollutant Discharge Elimination System (NPDES) Storm Water General Permits Coverage authorization to discharge to surface waters of Ohio, including Construction Storm Water, Industrial Storm Water, and Small MS4 General Permits. The data is provided by the Ohio Environmental Protection Agency's Division of Surface Water.

SC Sites with Controls

VERSION DATE: 09/03/14

As stated by the Ohio Environmental Protection Agency, Ohio's Voluntary Action Program (VAP) was established to allow the private sector to clean up brownfields – previously-developed sites with potential contamination from industrial or commercial activity that were not being redeveloped due to fear of litigation. The VAP sets standards for contaminated site assessment and remediation and reviews the activities conducted by certified professionals based on those standards to issue covenants not to sue (CNSs). This site listing includes those VAP sites with issued CNSs dated since 2008 that have institutional and/or engineering controls in place.

SPILLS Spills Listing

VERSION DATE: 08/20/14

This database of hazardous material spills is provided by the Emergency Response Program of the Ohio Environmental Protection Agency. The data includes spills reported since 1994.

SWF Solid Waste Facilities

VERSION DATE: 08/11/14

Municipal Solid Waste Landfills, Construction and Demolition Debris Landfills, and Municipal Solid Waste Transfer Facilities are included in this Ohio Environmental Protection Agency licensed solid waste facility list.

UST Underground Storage Tank Facilities

VERSION DATE: 09/17/14

The Bureau of Underground Storage Tank Regulations (BUSTR), a bureau of the State of Ohio Fire Marshal's office of the Ohio Department of Commerce, maintains this database of active and inactive registered facilities. On March 30, 1987, the State Fire Marshal created BUSTR to develop the underground storage tank program and to administer the federal Leaking Underground Storage Tank Trust Fund. BUSTR is financed through a combination a federal grants in combination with annual registration fees and permit fees. BUSTR's mission is to effectively regulate the safe operation of underground storage tanks and to ensure appropriate investigation and

cleanup of releases from underground storage tanks for the purpose of protecting human health and the environment for the citizens of Ohio.

VAPS Voluntary Action Program Sites

VERSION DATE: 09/02/14

The Ohio Environmental Protection Agency's Division of Environmental Response and Revitalization maintains this list of current Voluntary Action Program projects. This program was created to give individuals a way to investigate possible environmental contamination, clean it up if necessary and receive a promise from the State of Ohio that no more cleanup is needed. For those projects where a covenant not to sue has been issued, this is the endpoint of the voluntary action process. This list also includes Class C release designation sites as of February 2012. Class C sites, pursuant to HB 153, are eligible for the VAP as long as the release has been determined by the BUSTR to be a release of petroleum occurring or identified from a UST system subject to the Bureau of Underground Storage Tank Regulations (BUSTR) laws, where the responsible person for the release is specifically determined by BUSTR to not be a viable person capable of undertaking or completing the required corrective actions.

Environmental Records Definitions - TRIBAL

INDIANRES Indian Reservations

VERSION DATE: 01/01/00

The Department of Interior and Bureau of Indian Affairs maintains this database that includes American Indian Reservations, off-reservation trust lands, public domain allotments, Alaska Native Regional Corporations and Recognized State Reservations.

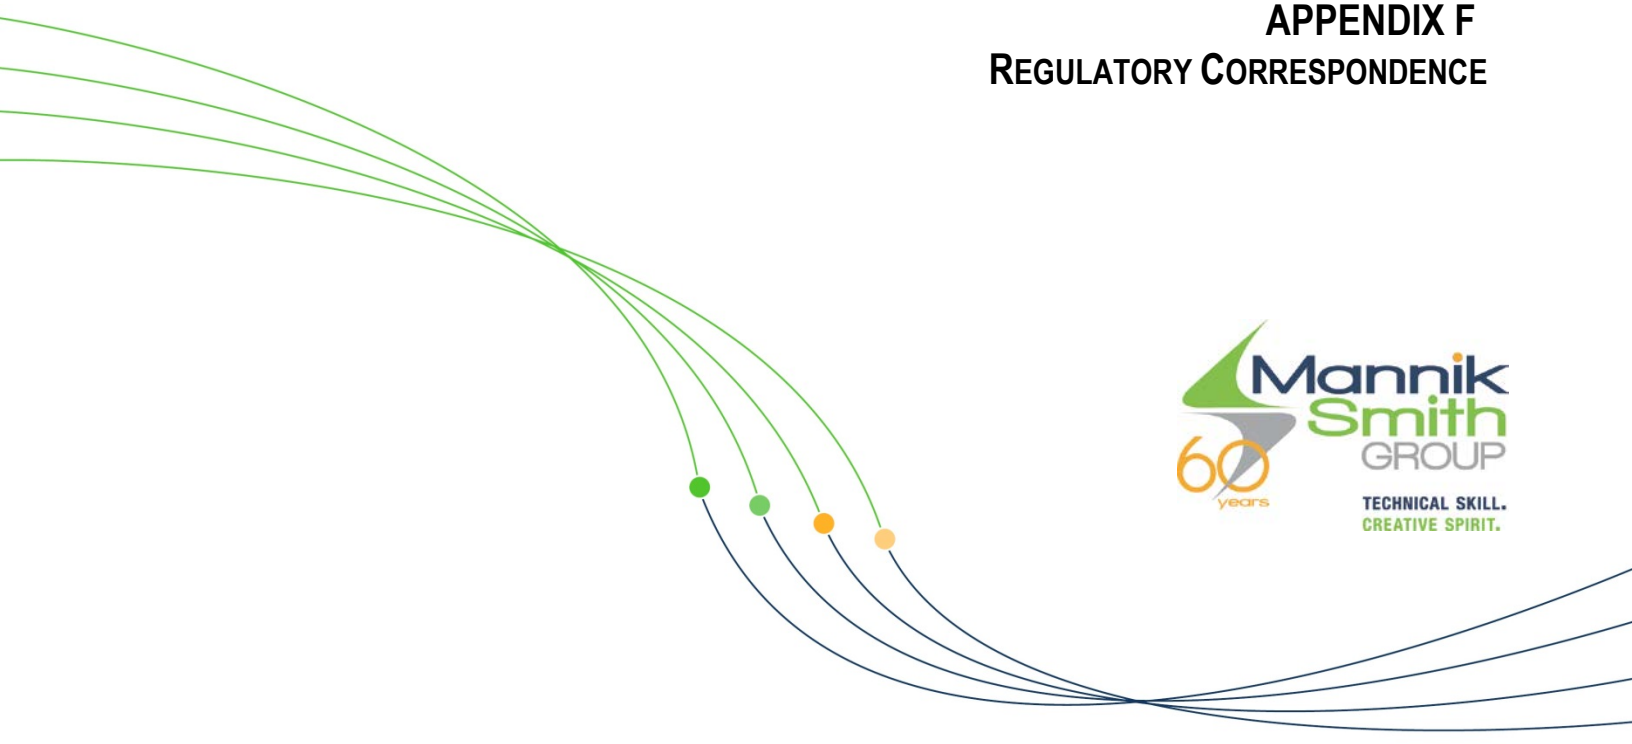
LUSTR05 Leaking Underground Storage Tanks On Tribal Lands

VERSION DATE: 11/06/13

This database, provided by the United States Environmental Protection Agency (EPA), contains leaking underground storage tanks on Tribal lands located in EPA Region 5. Region 5 includes the following states: Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin.

ODINDIAN Open Dump Inventory on Tribal Lands

VERSION DATE: 11/08/06



This Indian Health Service database contains information about facilities and sites on tribal lands where solid waste is disposed of, which are not sanitary landfills or hazardous waste disposal facilities, and which meet the criteria promulgated under section 4004 of the Solid Waste Disposal Act (42 U.S.C. 6944).

USTR05 Underground Storage Tanks On Tribal Lands

VERSION DATE: 11/04/13

This database, provided by the United States Environmental Protection Agency (EPA), contains underground storage tanks on Tribal lands located in EPA Region 5. Region 5 includes the following states: Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin.

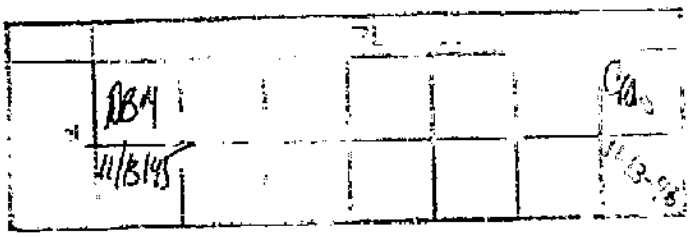
RE: NO FURTHER ACTION STATUS

Dear Mr. Scott:

The Bureau of Underground Storage Tank Regulations (BUSTR) has reviewed all information submitted for this site. Based on this information, BUSTR requires no further action involving corrective actions for remediation under the regulatory framework.

If you feel that you are entitled to reimbursement you should contact the Petroleum Underground Storage Tank Release Compensation Board (PUSTRCB) at P.O Box 163188, Columbus, Ohio 43216, (614) 752-8963 or (800) 224-4659. PUSTRCB administers Ohio's assurance fund and is a separate entity apart from BUSTR.



Thank you for your cooperation. If you have any questions, please contact Doug Thompson at (614) 752-7094.

Sincerely,

Diane B. McClure
Acting Corrective Actions Supervisor

RE. ADDITIONAL INFORMATION REQUESTED

Dear Mr. Scott:

The Bureau of Underground Storage Tank Regulations (BUSTR) has reviewed your report titled "Closure Plan for Campbell Soup Company" dated July 1995.

Based on our review of this report, BUSTR requests that information on the following points be supplied so we can determine the status of your site.

1. Approximately 400 cubic yards of excavated soil from the tank cavity remains stockpiled on this site. Analytical testing by EPA Method 8100 (modified) confirmed that high levels of contamination are present in this soil. Therefore, a remedial action plan (RAP) must be submitted to BUSTR within 90 days of this letter.

2. If you choose to dispose of the soil at a licensed disposal facility, please provide a copy of the waste disposal manifest to our Bureau

Please submit this information to BUSTR within 90 days from the date of this letter.

Thank you for your cooperation. If you have any questions, please contact me at (614) 752-7094.

Sincerely,

Paul D. Thompson
Environmental Specialist

CLOSURE CHECKLIST

12/21/94

OWNERSHIP OF TANKS	LOCATION OF TANKS
OWNER NO. 486 CAMPBELL SOUP CO. P.O. BOX 311 NAPOLEON, OHIO 43545 ATTN; DAVID FOLEY	INCIDENT NO. 3550557 FACILITY NO. 350059 CAMPBELL SOUP CO. EAST MAUMEE AVE. NAPOLEON, OHIO 43545

FILING INSTRUCTIONS

1. IN THE COLUMN ON THE LEFT SIDE OF THE FORM, PLACE EITHER THE PAGE NUMBER OR APPENDIX DESIGNATION WHERE EACH ITEM ON THE CHECKLIST CAN BE FOUND IN THE CLOSURE REPORT OR "N/A" (NOT APPLICABLE) FOR ITEMS THAT DO NOT APPLY TO YOUR CLOSURE REPORT.

2. UST OWNER MUST SIGN WHERE INDICATED AT THE END OF THIS FORM AND ATTACH IT TO THE CLOSURE REPORT. DEFICIENT CLOSURE REPORTS SUBMITTED TO OUR OFFICE WILL BE RETURNED TO THE UST OWNER FOR COMPLETION. SEND THE CLOSURE FORM AND THE CLOSURE REPORT TO THE ATTENTION OF THE "CLOSURE REVIEW SECTION".

NOTE: UST OWNER/OPERATORS SHALL SUBMIT ONE COPY OF THE WRITTEN CLOSURE REPORT WHICH SHALL BE RECEIVED BY THE STATE FIRE MARSHAL WITHIN 45 DAYS OF RECEIPT BY THE UST OWNER/OPERATOR OF SOIL AND/OR GROUND WATER LABORATORY ANALYSIS BUT NOT LATER THAN 90 DAYS FROM THE DATE OF COLLECTING SOIL AND/OR GROUND WATER SAMPLES.

I. UST SYSTEM OWNER, OPERATOR, AND FACILITY DATA

8 UST OWNER (NAME; ADDRESS; ZIP CODE; COUNTY; PHONE NO.)
8 UST OPERATOR (NAME; ADDRESS; ZIP CODE; COUNTY; PHONE NO.)
8 UST FACILITY LOCATION (NAME; ADDRESS; ZIP CODE; COUNTY; PHONE NO.)
8 UST FACILITY OWNER (NAME; ADDRESS; ZIP CODE; COUNTY; PHONE NO.)

II. UST SYSTEM DATA

16 DATE OF UST REMOVAL OR ABANDONMENT
11 UST SYSTEM AGE (YEARS)
11 UST CAPACITY (GALLONS)
11 UST SYSTEM CONSTRUCTION (E.G., STEEL, FIBERGLASS, ETC.)
8 DATE UST SYSTEM LAST USED
8 PERSON WHO LAST USED UST SYSTEM
11 SUBSTANCE STORED IN UST BOTH PAST AND PRESENT (E.G. GASOLINE, DIESEL FUEL, USED OIL, ETC.)
8 UST SYSTEM USE (E.G. RETAIL SALES, RESIDENTIAL, FARM, BUSINESS, ETC.)
8 UST SYSTEM STATUS (PERMANENTLY REMOVED, ABANDONED-IN-PLACE, CHANGE-IN-SERVICE, OR TEMPORARY CLOSURE BEYOND TWELVE MONTHS)

III. WASTE DISPOSAL DATA

34 DISPOSAL OF UST SYSTEM
12 DISPOSAL AND FINAL LOCATION OF ANY LIQUIDS FROM UST SYSTEM OR UST SYSTEM EXCAVATION

IV. SAMPLING DATA -

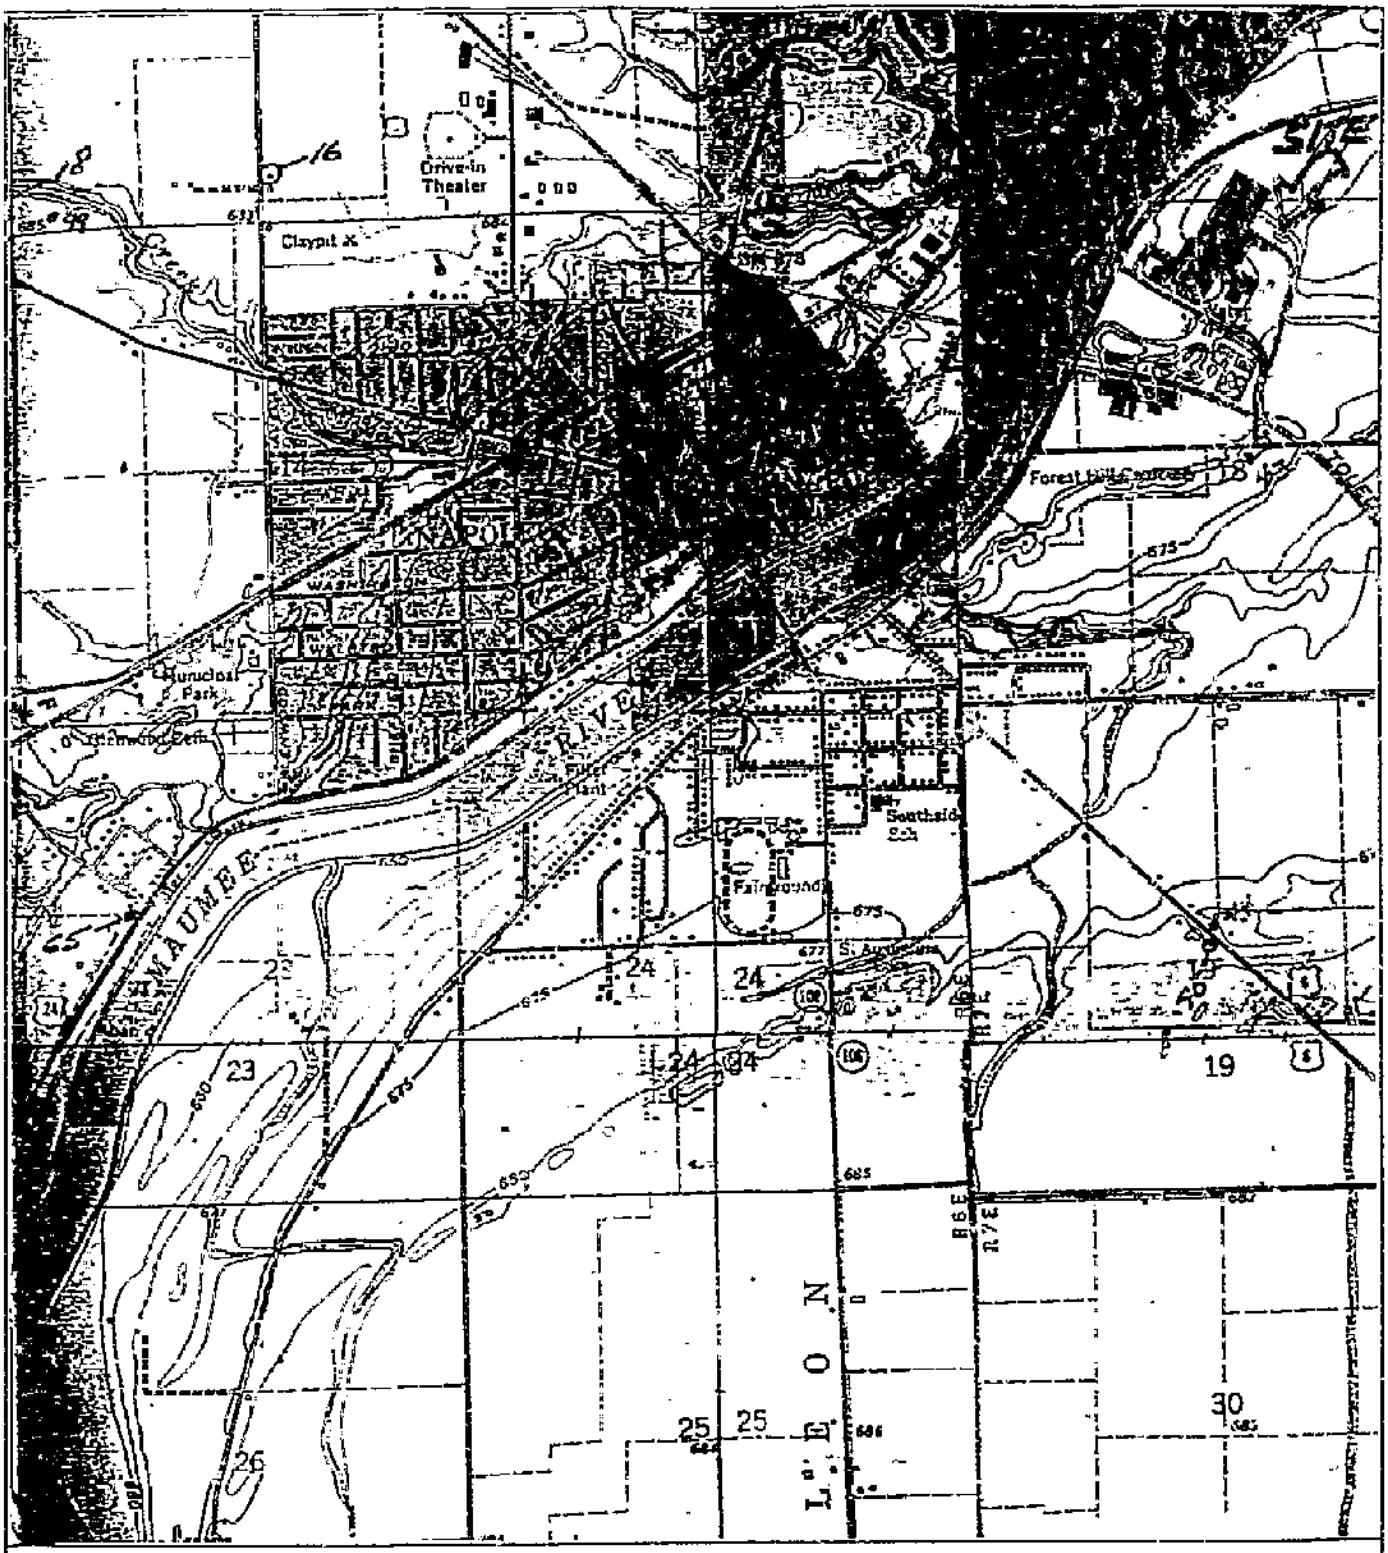
2.0 Introduction

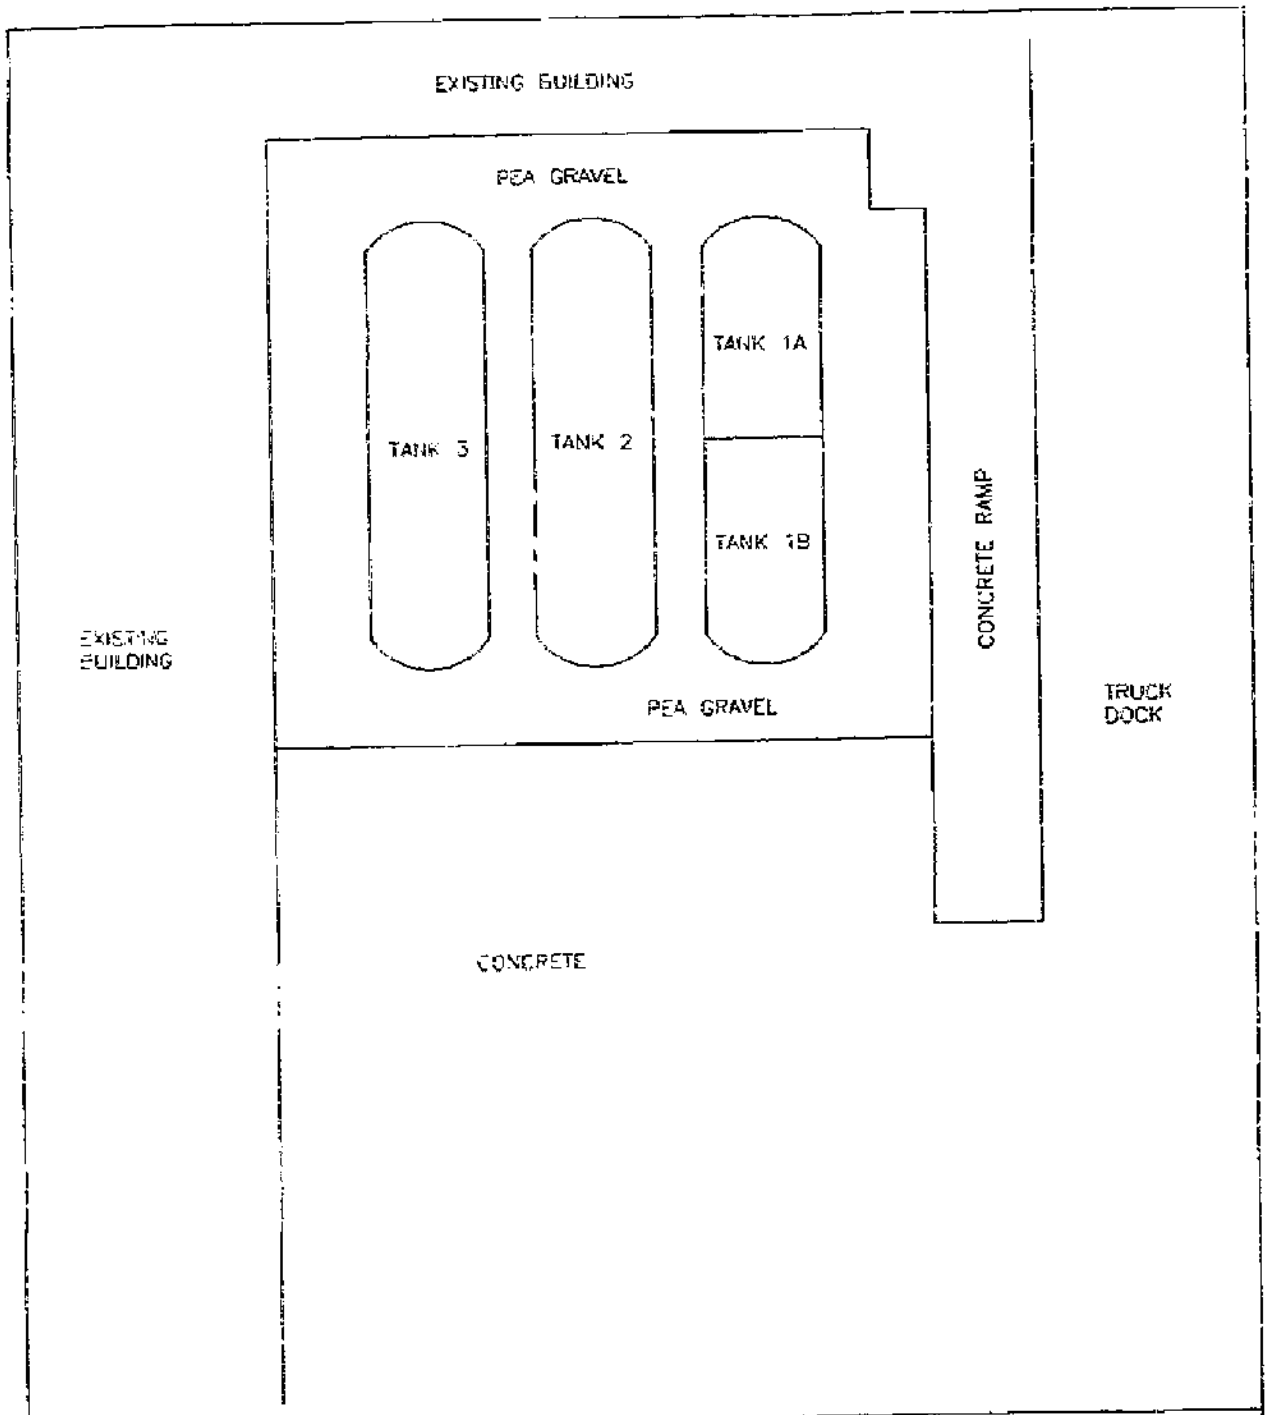


Great Lakes Response, Inc. (GLR) was contracted by Campbell Soup Co. to provide underground storage tank (UST) closure services. The current owner of the UST system is Campbell Soup Co. and can be contacted at East Maumee Ave. Napoleon, Ohio 43545 (419)599-6794. The current operator of the UST system is Campbell Soup Co. and can be contacted at East Maumee Ave. Napoleon, Ohio 43545 (419)599-6794. The UST system is located at Campbell Soup Co. East Maumee Ave. Napoleon, Ohio 43545 (419)599-6794 and this facility is currently owned by Campbell Soup Co. of East Maumee Ave., Napoleon, Ohio 43545 (419)599-6794. The UST system is currently not in use. The systems were last utilized as follows:

The Double Compartment 10,000 gallon tank last contained Heavy Naptha, Compartment A (5,000 gallon) Aliphatic Petroleum, Compartment B (5,000 gallon). The date last used was July 1994 by Campbell Soup Co. East Maumee Ave. Napoleon, Ohio 43545 (419)566-6794.

The Certified Fire Inspector on site during UST Removal and Closure Procedures was Larry Horstman, License #303. The local fire department with jurisdiction in the area of UST removal and permanent closure was Napoleon Fire Department 265 W. Riverview Ave., Napoleon, Ohio 43545 (419)592-0441.

The objective of this closure assessment is to provide documentation of the closure activities conducted at the site of the UST removal and to summarize the results of closure sampling and laboratory analysis performed. This report is prepared in accordance with the requirements of The Ohio Department of Commerce, Division of the State Fire Marshal, Bureau of Underground Storage Tank Regulations (BUSTR), dated after September 1, 1992.



For site location map see figure 2.1. For a general site map see figure 2.2.

2.2 GENERAL SITE MAP

3.0 Visual Site Evaluation

On June 9, 1995, Scott Ferry of Great Lakes Response, Inc. performed a visual site evaluation of the areas surrounding the UST locations.

The visual inspection showed no signs of release on the surface area around the fill pipes or dispenser (see figure 2.2 for a general site map).

The following specifications apply to the UST system:

	Tank Capacity	Construction	Age	Product Present	Product Past
#1	Dual Compartment		<10 yrs.		
	10,000	Steel			
#A	5,000			Heavy Naptha	
#B	5,000			Aliphatic Petroleum	
#2	10,000	Double Wall	<10 yrs.	Aliphatic Hydrocarbons	
		Steel		Aromatic Hydrocarbons	
#3	10,000	Steel	<10 yrs.	Dimethylaminoethanol	

NOTE: Tanks #2 and #3 were non-regulated flow through process tanks per BUSTR Regulations 1301:7-9-02(16) and were removed at the same time. They are noted strictly for informational purposes.

4.0 Closure Activities

Closure activities performed at Campbell Soup Co. consisted of site scoring, product removal, tank excavation, nitrogen purging, cold cutting, tank decontamination, field screening, closure sampling, tank destruction, and closure reporting.

4.1 Product Removal

Great Lakes Response, Inc. removed 300 gallons of product from the UST system prior to nitrogen purging operations. Waste product removed from the tank was characterized, transported and disposed of in accordance with all local, state and federal regulations. For documentation pertaining to product disposal see appendix K.

4.2 Tank Excavation (Tank Exposure)

GLR personnel arrived on site, June 12, 1995, to begin excavation on the 10,000 tanks. Excavation was performed to expose the tank tops and associated piping. Product lines were disconnected and flushed into D.O.T. 17H Steel drums (see appendix A, for 30 day notification, UST removal permit and underground storage tank installer certificate).

4.3 Nitrogen Purging

To prepare for cold cutting, GLR personnel utilized nitrogen (N2) to inert the tanks interior through the following procedures:

A. Nitrogen was introduced through a single opening six inches from the tank bottom (opposite end from the vent riser). Nitrogen was dispersed at 5-7 psig to avoid generation of static electricity.

B. GLR personnel displaced 668 cubic feet of

nitrogen in the 5,000 gallon Heavy Naptha tank to achieve the following atmospheric readings:

% Oxygen - 20.8

% LEL - 0

Toxic Gas Alert - Fault

GLR personnel displaced 668 cubic feet of nitrogen in the 5,000 gallon Aliphatic Petroleum tank to achieve the following atmospheric readings:

% Oxygen - 20.9

% LEL - 0

Toxic Gas Alert - Fault

NOTE: The dynamation CGM gas detection instrument toxic alert channel was intentionally faulted to avoid sensor damage due to extreme N2 concentrations as per the manufacturers recommendation.

C. At this point the tank(s)were determined to be in satisfactory condition to begin the cold cutting procedure (refer to appendix B for a standard operating procedure for nitrogen purging).

4.4 Cold Cutting (Taken from GLR Standard Oper. Proc.)

Once the oxygen monitor indicates less than 8% oxygen, draw a minimum 22"x 22" square along the tanks centerline. The remainder of this procedure shall be performed only while air monitoring is being performed. Utilizing a pneumatic drill, drill two (1) inch holes on opposite corners of the 22" x 22" outline. During the drilling process, the hole saw blade should receive a continuous oil bath.

Note: Use chemical absorbents to collect any oil run off and avoid soil contamination. While continuing constant air monitoring, use a pneumatically driven reciprocating saw to slowly cut 90 degree angles, thus removing a 22"x 22" square. The saw blade should be constantly quenching in oil to avoid heat caused by

friction. Do not let the cut-out section of the tank drop into the tank, this would break the inert gas layer and create a possible spark.

To insure the tank interior is completely purged. use monitoring equipment to indicate oxygen concentration and L.E.L.

Note: Combustible gas indicator readings may be misleading where the tank atmosphere contains less than 5% oxygen by volume.

Note: Use the provided nitrogen purging chart as a reference. Always use proper monitoring equipment to insure complete purging.

All Great Lakes Response, Inc. personnel performing or assisting in the performance of nitrogen purging shall:

1. Have proper documented training on nitrogen purging.
2. Be familiar with the M.S.D.S. on Nitrogen.
3. Be familiar and signed off on the site specific health and safety plan for the job where nitrogen purging is to take place.

Note: Nitrogen purging will only be performed on a storage tank that has no manway and must be entered by Great Lakes Response, Inc. personnel.

Note: During the performance of nitrogen purging, all non-essential personnel and equipment will be restricted to areas beyond the contamination reduction zone.

Note: The atmosphere within the tank must be at 8% oxygen or less by volume before any cutting or drilling is performed.

4.5 Tank Cleaning

GLR performed tank decontamination in the following manner (in accordance with A.P.I. 2015):

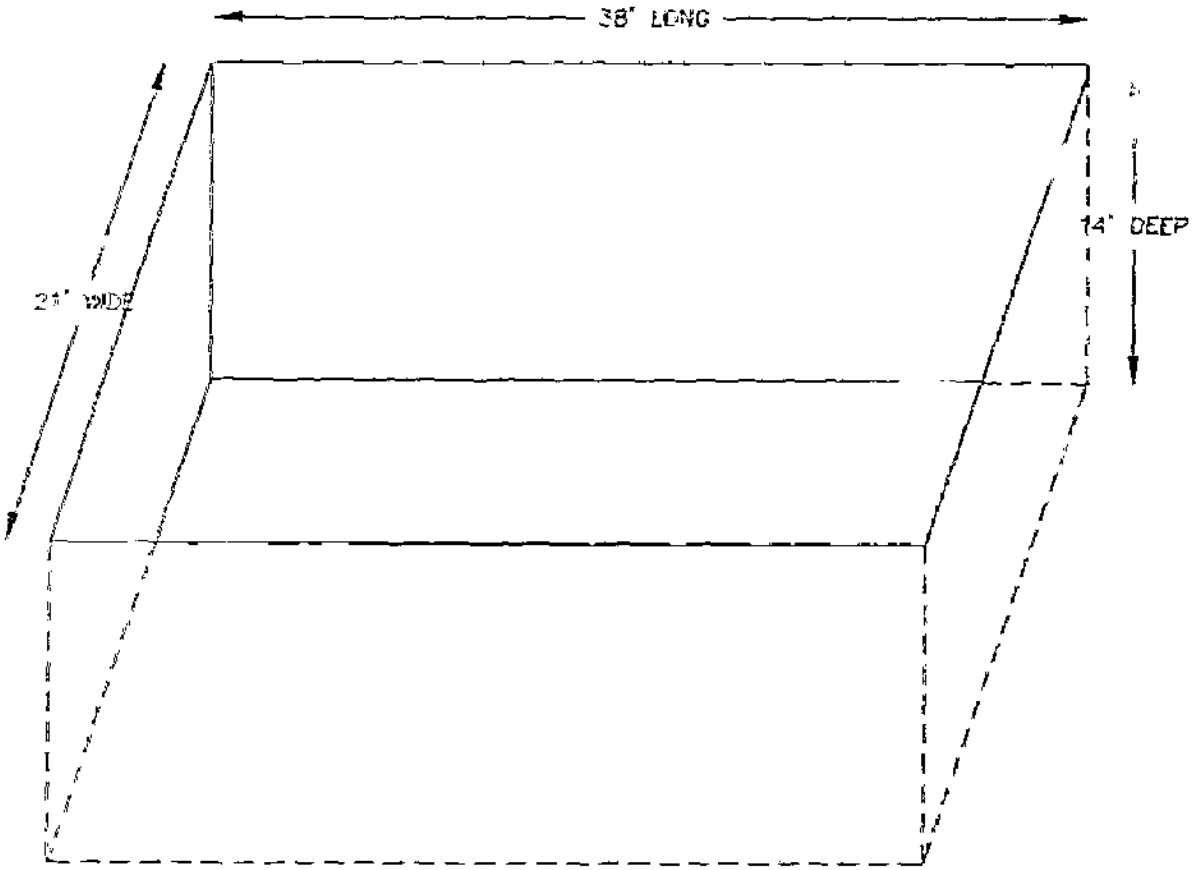
A. The interior of both tanks were scraped, using non-sparking tools to remove all sludge and residue, then scrubbed with a bio-degradable non-hazardous degreaser.

B. The interiors were squeegeed clean, then rinsed with 2,000 p.s.i. cold water and drummed. This rinsing procedure was performed a total of three times. Atmospheric readings were taken with ventilation secured to ensure the tanks were completely cleaned. Internal tank readings were as follows:

1. 5,000 Tank - Oxygen 20.8 by volume
   L.E.L. 0 by volume
   Tox Alert 0 p.p.m.
2. 5,000 Tank - Oxygen 20.9% by volume
   L.E.L. 0% by volume
   Tox Alert 0 p.p.m.

See appendix C for the following: Confined Space Entry Standard Operation Procedures; Confined Space Entry permit; combustible gas monitor calibration log.

4.6 Tank Removal



GLR personnel removed all UST(s) and associated piping on June 14, 1995. GLR personnel removed all fill material (not to exceed 1 foot beyond original tank excavation) and staged excavated fill on double layer 4 mil polyethylene sheeting in accordance with API 1604. Native soils encountered during UST excavation consisted of Sandy clay to shale. GLR personnel excavated and staged 400 cubic yards of original fill material. A mapped location of all utilities exposed during the UST excavation can be found in figure 4.1; a mapped location of UST excavation size(s) can be found in figure 4.2; and a mapped length and diameter of UST(s) and product lines can be found in figure 4.3.

4.3 UST & PIPING DIMENSIONS

5.0 Field Screening

Soil samples were field screened with a Photovac Micro-tip Photoionization Detector (PID) for the presence of volatile organic compounds (VOCs). In this test, a portion of each sample was placed into a clean, air tight glass jar. The mouth of each jar was covered with aluminum foil, and secured with a screw on lid. After at least ten minutes holding time, the head space above each sample was scanned for VOCs with the PID, by piercing the aluminum foil seal with the instrument probe and recording the maximum observed VOC reading.

The PID (Photo Vac Micro Tip II) was calibrated with 100 p.p.m. isobutylene in air commercial gas standard. Calibration and user techniques were in accordance with manufacturers instructions (see appendix D for the photovac calibration record and manufacturers recommended calibration procedures).

5.1 Field Screening Results

The soil samples for field screening were obtained from the excavation floor, under each tank end, from the excavation walls, from the product pipe run, and from under the dispensers. Refer to table 5.1 for sample results and figure 5.1 for field screening sample locations.

5.1 FIELD SCREENING
SAMPLE LOCATIONS

5.2 Stockpile Soil Field Screening

An estimated 400 cubic yards of fill material was excavated and properly staged. Soil samples were retrieved from 10 locations of the stockpiled soil per the Ohio PCS policy dated September 1993. Field Screening procedures are consistent with Section 5.0

	Cubic yards of soil per stockpile				
	0-25	26-100	101-500	501-1000	>1000
Minimum # of grab samples to collect and field screen	2	6	8	10	10 plus 1 samples per additional 100 cubic yards (or fraction thereof)
Minimum # of grab samples to submit to the lab field screened	1	1	2	3	4 plus 1 sample per additional 500 cubic yards (or fraction thereof)

6.0 Soil Sampling

Soil sampling was performed in such a manner as to cause the least amount of soil disturbance in the area to be sampled. Four inches of soil was scraped off the sample area prior to the sample being retrieved through the use of a hand soil sample tube.

All sampling equipment was decontaminated between samples as described in section 6.3.

All samples were placed in clean, new containers with the Teflon lined lids. All sample jars were completely filled to avoid any head space.

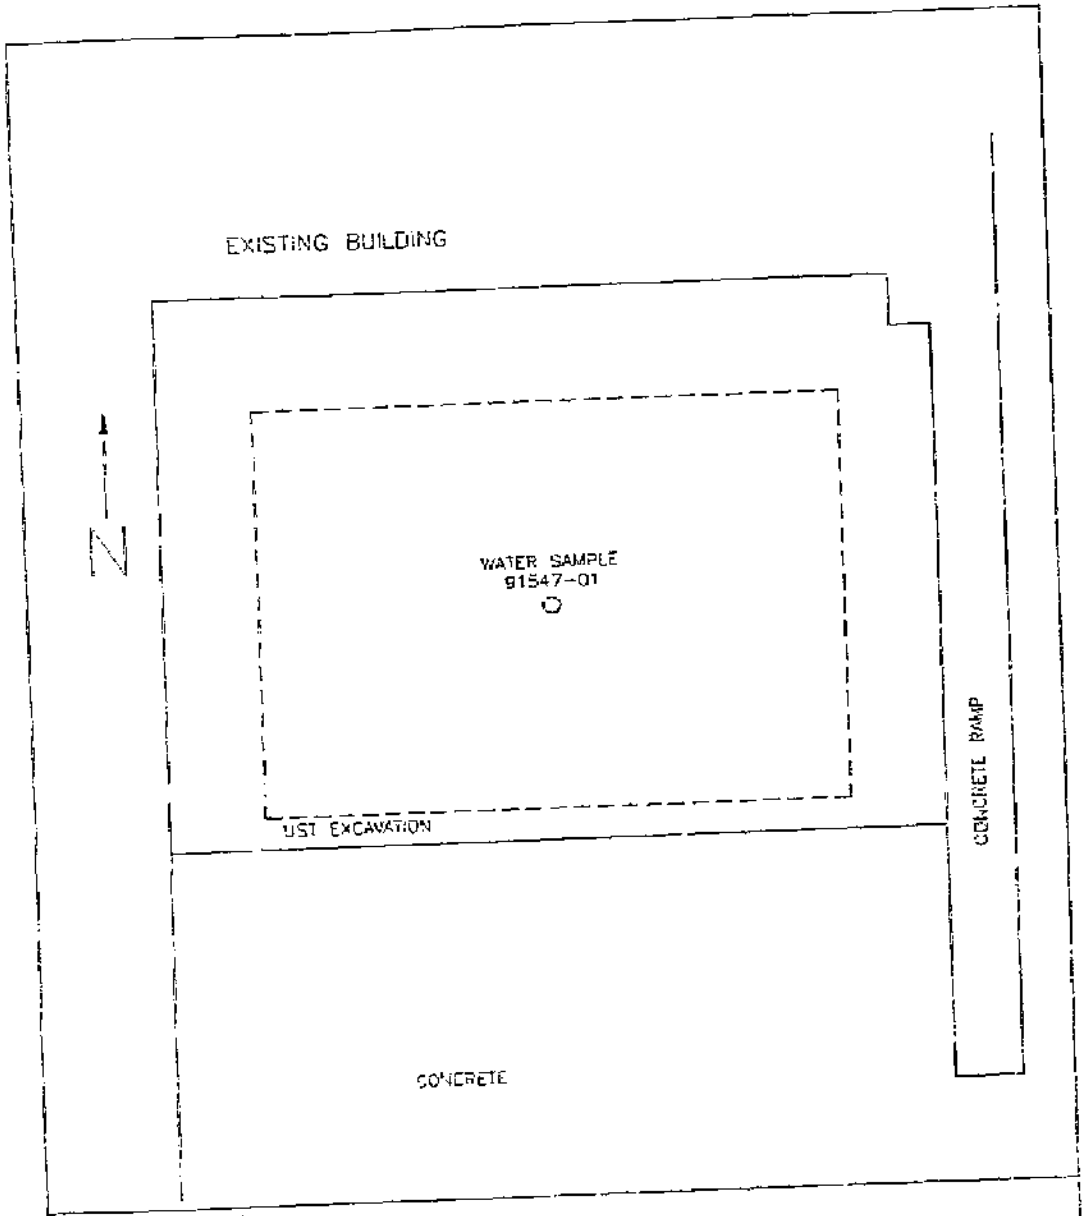
Refer to Table in section 6.2 for sample locations and depths and Figure 6.1 for sample location mapping.

6.1 Sample Handling/Identification

All samples were immediately placed into an ice filled cooler (4 degrees c) for preservation. A chain-of- custody form was prepared to document sample identification and handling. A copy of the chain-of-custody is included in Appendix E.

Sampler's Name: Mike Cole

Title: Supervisor



Employer: Great Lakes Response, Inc.

Date: June 14, 1995

	Sample ID	Sample Location	Depth
1.	91547-01	Water in tank excavation	15'
2.	LS SP-01	Stockpile	2'
3.	LS SP-02	Stockpile	2'

6.2 Decontamination

All sampling equipment was decontaminated between sample locations to reduce the possibility of cross contamination. The sampling spoon was decontaminated with a laboratory grade soap, rinsed with distilled water, and wiped dry between each use.

JUNE 15, 1995

6.1 SAMPLE LOCATIONS

7.0 Stockpiled Soil Sampling and Characterization

On June 14, 1995, Great Lakes Response, Inc., excavated and stockpiled 400 cubic yards of fill material in accordance with The Ohio Administrative Code 1301: 7-9-92 (I)(1)(e).

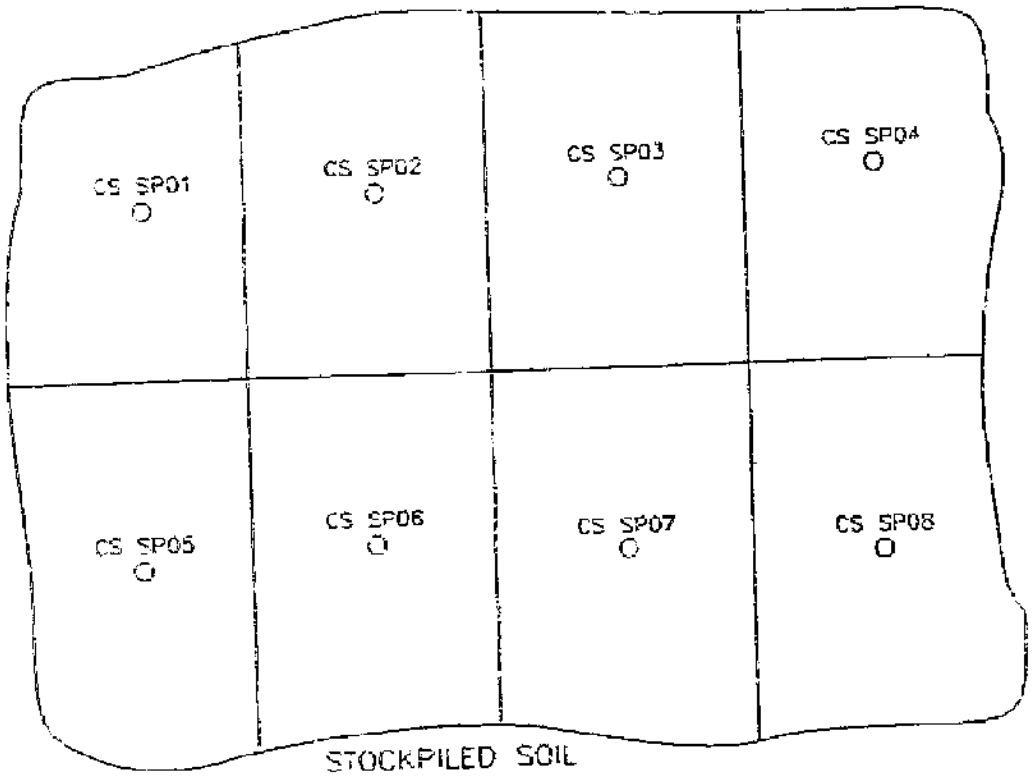
In accordance with The Ohio Department of Commerce Division of State Fire Marshal Bureau of Underground Storage Tank Stockpile Guidance Document dated 9/8/93, Great Lakes Response utilized the following method to calculate stockpile volume:

For an excavation of rectangular shape:

length x width x depth + volume of cavity

volume of cavity - total volume of all USTs = Total volume removed

Total volume removed x 1.5 = Total stockpile volume



7.1 Stockpile Field Screening

After calculation of the volume of stockpiled soil was determined, the following table was utilized to determine the minimum number of grab samples collected for field screening and the minimum number of samples to be transported to a laboratory for the required analysis

Cubic yards of soil per stockpile 400 c.y.

	0-25	26-100	101-500	501-1000	1001-2000	>2000
Minimum # of grab samples to collect and field screen	2	6	8	10	13	13 plus 3 samples per add'l 500 c.y.
Minimum # of grab samples to submit to the lab	1	1	2	3	4	4 plus 1 sample per add'l 500 c.y.

NOTE: All sampling was performed as described in section 6.0

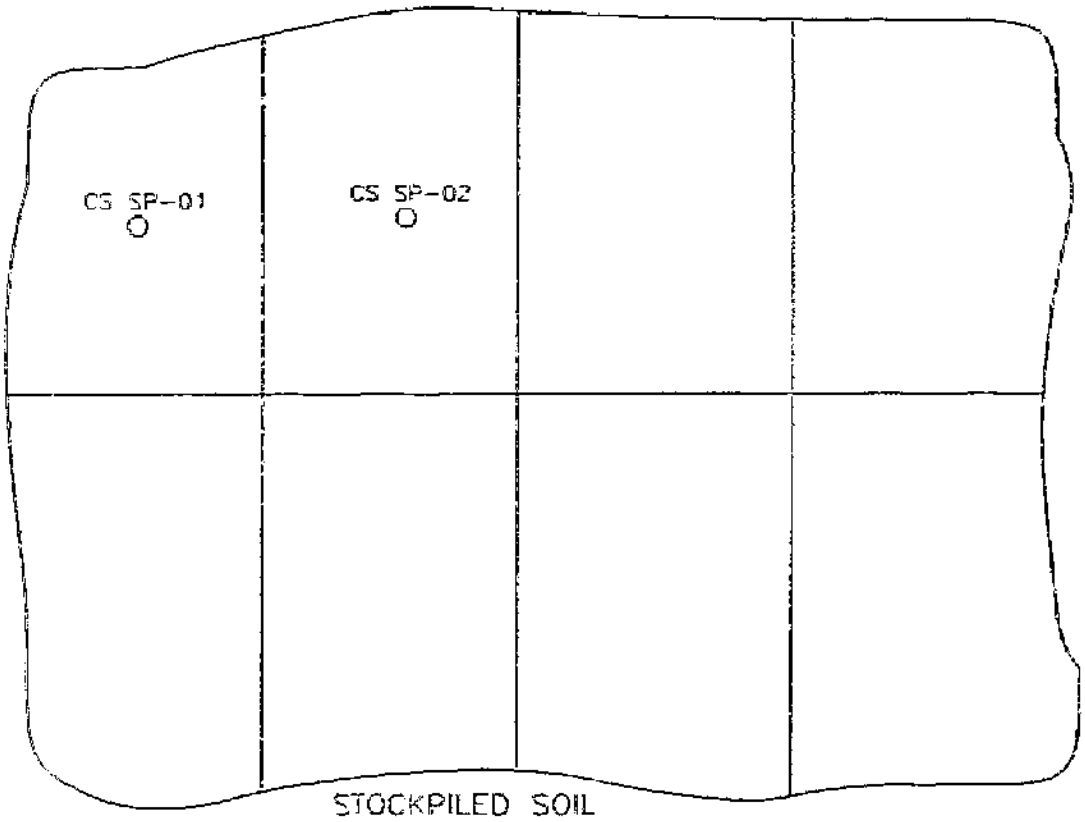
7.2 Stockpile Soil Sampling



On June 14, 1995, Mike Cole of Great Lakes Response retrieved 3 soil samples for field screening. Of the 8 samples collected for field screening, 2 were transported for laboratory analysis.

NOTE: All sampling was performed in accordance with the SFM Corrected Action Guidance Document Section IV, Appendix A

NOTE: Field screening and sample handling procedures can be found in Section 5.0 and 6.2

For sample locations see Figure 7.2.

A copy of laboratory analysis can be found in appendixes F.

8.0 Laboratory Data

All analytical was performed by Electro Analytical Laboratories, Inc., 7118 Industrial Park Blvd., Mentor, Ohio 44060 (216)951-3514. Samples analyst was Tony Solitro.

8.1 Sample Analysis

All samples were collected on June 14, 1995 and transported to the laboratory in accordance with section 6.2 on June 15 and 16, 1995. Laboratory analysis was performed on June 16, 1995. The sample matrix was water and pea gravel. The following test method(s) was used to determine solid and liquid contamination concentrations:

Middle Distillates

A. Soil: BTEX (8020), PAHs (8100), TPH (418.1)

B. Water: BTEX (602), PAHs (610)

Detection Limits for the above stated analytical can be found on the hard copy analytical results sheet found in appendix F.

Laboratory instrument calibration can be found in appendix M.

9.0 Tank Destruction

On June 14, 1995, Great Lakes Response, Inc. did destroy the following tank(s):
(2)-10,000 and (1)-10,000 gallon Double Compartment steel was destroyed. The tanks were destroyed on site. The method of tank destruction was prepared for recycling.
Tank final disposal facility was N-R-G Recycling, 471 TR "R", Napoleon, Ohio 43545 (419) 599-1659.
Information retrieved from the tank identification plate was as follows:

I.D. Number: 152105
Capacity: 10,000
Manufacturer: ST1-P3
Other: _____ _____

Certificate of Decontamination and Destruction can be found in appendix H.

10.0 Remedial Option(s)

Great Lakes Response, Inc. reviewed with Jonathan Scott of Campbell's Soup Co. the following remedial options and their associated liabilities:

A. Landfilling
B. Thermo Destruction
C. Bio-Remediation
D. Aeration
E. Vapor Extraction

Of the above stated options, no further action was chosen due to tank excavation deemed clean through analytical, proper disposal of pea gravel stockpile recommended.

10.1 Stockpiled Soil (Disposal)

All Stockpiled pea gravel was sampled and characterized as described in section 7.0, 7.2 and Table 7.2.

All stockpiled soil was characterized with elevated levels of Polynuclear Hydrocarbons. Campbell Soup Company is awaiting a recommendation by the Ohio Department of Commerce, Division of State Fire Marshal Bureau of Underground Storage Tank Regulations, on how to properly handle stockpiled pea gravel.

11.0 SFM Site Feature Scoring System Checklist (SFSS)

The distance to the closest potable water supply source currently in use is >1,000 feet. This information was obtained from/by Ohio Department of Natural Resources.

The average depth to ground water in the surrounding areas in regards to the UST removal was 3' feet. This information was obtained from/by Ohio Department of Natural Resources.

The predominant soil type of substratum in the UST excavation and piping runs was as follows; sandy clay to shale.

This information was gathered through visual analysis.

The following natural and/or man made conduit/receptors near the UST and piping excavation are as follows: none.

For a copy of the SFM Site Feature Scoring System (SFSS) Checklist can be found in appendix L.

12.0 Remedial Recommendations

In accordance with OAC 1301:7-9-12(L)(2)(b)(vi) and SFM Site Feature Scoring System Chart, Great Lakes Response, Inc., recommends the following remedial actions:

No further action. Pea gravel stockpiled from tank excavation may require proper disposal for elevated levels of Polynuclear Hydrocarbons.

13.0 Soil and/or groundwater and analytical sample results from closure report are as follows:

TABLE 12.1 - ANALYTICAL DATA

In accordance with underground storage tank closure assessment requirements. This letter is to notify the above addressed State Agency of intent to permanently close (3) 10,000 gallon underground storage tanks located at East Maumee Ave., Napoleon, Ohio.

Great Lakes Response, Inc. will be performing the underground storage tank closure in accordance with all Federal, State, and local Requirements.

Installer I.D. #10-90-0967
Scott A. Ferry

Great Lakes Response, Inc. will submit a State of Ohio Closure Plan upon completion of this project.

Scott Ferry
Field Superintendent

NITROGEN PURGING

1.) THE FIRST STEP IN COLD CUTTING A TANK THAT CONTAINS A FLAMMABLE ATMOSPHERE IS NITROGEN PURGING.

NITROGEN SHOULD BE INTRODUCED THROUGH A SINGLE TANK OPENING AT A POINT NEAR THE BOTTOM OF THE TANK AT THE END OF THE TANK OPPOSITE THE V[illegible]T. WHEN NITROGEN IS USED IT SHOULD BE INTRODUCED UNDER [illegible]W PRESSURE TO AVOID THE GENERATION OF STATIC ELECTRICITY. A PRESSURE GAUGE SHOULD BE INSTALLED TO INSURE TANK PRESSURE DOES NOT EXCEED (5) PSIG. THE PROCESS OF INTRODUCING COMPRESSED GASES INTO A TANK MAY CREATE A POTENTIAL IGNITION HAZARD AS THE RESULT OF THE DEVELOPMENT OF STATIC ELECTRICAL CHARGES. UNDER NO CIRCUMSTANCES WILL A C02 FIRE EXTINGUISHER BE USED FOR INERTING FLAMMABLE ATMOSPHERES. TO PREVENT POSSIBLE STATIC IGNITIONS, THE NITROGEN REGULATOR MUST BE EQUIPPED WITH A GROUND STRAP. THE NITROGEN DISCHARGE HOSE MUST HAVE A PERMANENT GROUND WIRE RUNNING THE ENTIRE POSE LENGTH CONNECTED TO A SEPARATE GROUND STRAP.

TO INSURE THE TANK INTERIOR IS COMPLETELY PURGEL, USE MONITORING EQUIPMENT TO INDICATE OXYGEN CONCENTRATION AND L.E.L.

NOTE: COMBUSTIBLE GAS INDICATOR READINGS MAY BE MISLEADING WHERE THE TANK ATMOSPHERE CONTAINS LESS THAN 5% OXYGEN BY VOLUME.

NOTE: USE THE PROVIDED NITROGEN PURGING CHART AS A REFERENCE. ALWAYS USE PROPER MONITORING EQUIPMENT TO INSURE COMPLETE PURGING.

ONCE THE OXYGEN MONITOR INDICATES LESS THAN 8% OXYGEN, DRAW A 24 X 24 INCH SQUARE ALONG THE TANKS CENTERLINE. THE REMAINDER OF THIS PROCEDURE SHALL BE PERFORMED ONLY WHILE AIR MONITORING IS BEING PERFORMED. DRILL TWO - (1) INCH HOLES ON OPPOSITE CORNERS OF THE 24 X 24 INCH OUTLINE. DURING THE DRILLING PROCESS, THE HOLE SAW BLADE SHOULD RECEIVE A CONTINUOUS OIL BATH. NOTE: USE CHEMICAL ABSORBENTS TO COLLECT ANY OIL RUN-OFF AND AVOID SOIL CONTAMINATION. WHILE CONTINUING CONSTANT AIR MONITORING, USE A RECIPROCATING SAW TO SLOWLY CUT 90 DEGREE ANGLES, THUS REMOVING A 24" X 24" SQUARE. THE SAW BLADE SHOULD BE CONSTANTLY QUENCHED IN OIL TO AVOID HEAT CAUSED BY FRICTION. DO NOT LET THE CUT-OUT SECTION OF THE TANK DROP INTO THE TANK, THIS WOULD BREAK THE INERT GAS LAYER AND CREATE A POSSIBLE SPARK.

NITROGEN PURGIN

1. ALL GREAT LAKES RESPONSE PERSONNEL PERFORMING OR ASSISTING IN THE PERFORMANCE OF NITROGEN PURGING SHALL:

   A. HAVE PROPER DOCUMENTED TRAINING ON NITROGEN PURGING.

   B. BE FAMILIAR WITH THE M.S.D.S. ON N2

   C. BE FAMILIAR AND SIGNED OFF ON THE SITE SPECIFIC HEALTH AND SAFETY PLAN FOR THE JOB WHERE NITROGEN PURGING IS TO TAKE PLACE.

**NOTE: NITROGEN PURGING WILL ONLY BE PERFORMED ON A STORAGE TANK THAT HAS NO MANWAY AND MUST BE ENTERED BY GREAT LAKES RESPONSE PERSONNEL.

**NOTE: DURING THE PERFORMANCE OF NITROGEN PURGING, ALL NON-ESSENTIAL PERSONNEL AND EQUIPMENT WILL BE RESTRICTED TO AREAS BEYOND THE CONTAMINATION REDUCTION ZONE.

**NOTE: THE ATMOSPHERE WITHIN THE TANK MUST BE AT 8% OXYGEN OR LESS BY VOLUME BEFORE ANY CUTTING OR DRILLING IS PERFORMED.

THIS MANUAL DETAILS THE HEALTH AND SAFETY PLAN AND OPERATING PROCEDURES TO BE EMPLOYED AT:

CAMPBELL SOUP
P.O. BOX 311
NAPOLEON, OHIO

THIS DOCUMENT IS NOT INTENDED TO BE A COMPREHENSIVE TRAINING MANUAL OR TO DETAIL ALL PROCEDURES WHICH MAY BE UTILIZED ON SITE BUT IS INTENDED TO BE A GUIDANCE MANUAL FOR ROUTINE OPERATIONS AND A SOURCE OF GENERAL INFORMATION. DETAILED INFORMATION AND GUIDANCE ON MATERIALS NOT COVERED IN THIS PLAN WILL BE PROVIDED BY SUPPORT PERSONNEL BOTH ON AND OFF SITE AS NEEDED (SEE ORGANIZATION).

THE SITE OF THIS PROJECT: CAMPBELL SOUP
P.O. BOX 311
NAPOLEON, OHIO

DATE: BEGINNING JUNE 12, 1995

HAZARDS: HEAVY NAPTHA, ALIPHATIC PETROLEUM DISTILLATES, PAINT PRODUCT CONTAINS -DIMETHYLAMINDETHANOL, N-BUTYL ALCOHOL, BUTYL CARBITOL, BUTYL CELLOSOLVE, HI SOLIDS "C" ENAMEL CONTAINS- ALIPHATIC HYDROCARBON AND AROMATIC HYDROCARBON

AREA AFFECTED: FACILITY

SURROUNDING POPULATION: HEAVY INDUSTRIAL

TOPOGRAPHY: FLAT, SIMILAR TO SURROUNDING AREA'S.

CLIMATIC CONDITIONS: EARLY SUMMER, WARM TEMPERATURES, ANTICIPATED PRECIPITATION.

ADDITIONAL INFORMATION: COMPOUND NAME: HYDROTREATED HEAVY NAPTHA
BOILING POINT: 320°F
SPECIFIC GRAVITY: 3.79
VAPOR PRESSURE: 6mm @ 106°F
VAPOR DENSITY: 3.9
% VOLATILE: 100
LEL: 0.4
UEL: 5.0

COMPOUND NAME: ALIPHATIC PETROLEUM DISTILLATES
PEL: 500ppm
TLV: 100ppm
BOILING POINT: 300°F
VAPOR PRESSURE: 2 mmHg
FLASHPOINT: 100°F

COMPOUND NAME: PAINT PRODUCT: (CON
DIMETHYLAMINOETHANC JTYL
CELLOSOLVE, BUTYL CA L, BUTYL-
CELLOSOLVE)
BOILING POINT: 212°F
VAPOR PRESSURE: 24.0 mm @ 77
VAPOR DENSITY: 5.6
SPECIFIC GRAVITY: 1.00
H_2O SOLUBLE: YES
FLASHPOINT: 138°F
LEL: 1.0
UEL: 12,000

COMPOUND NAME: HI SOLIDS "C" ENAMEL: (CONTAINS:
ALIPHATIC HYDROCARBON, AROMATIC
HYDROCARBON)
LEL: 0.9
TLV: 267 ppm
% VOLATILE: 30
FLASHPOINT: 86°F

South East "Tank"

MATERIAL SAFETY DATA SHEET

THIS PRODUCT SAFETY INFORMATION IS PROVIDED PERIODICALLY TO ASSIST OUR CUSTOMERS IN ASSESSING COMPLIANCE WITH HEALTH/SAFETY/ENVIRONMENTAL REGULATIONS. PLEASE FORWARD THIS TO YOUR MANAGER OF SAFETY AND HEALTH. THIS FORM REPLACES ONE PREVIOUS FORM DATED 06/22/87.

0107

SECTION II INGREDIENTS

MIAL(S)
HOTREATED HEAVY NAPHTHA CONTAINING 17 TO 19 VOL.% AROMATICS.

SECTION III PHYSICAL DATA

VO POINT: 760 mm Hg 321 TO 593 °F. °C

ING POINT N/A °F. °C

FIC GRAVITY: (H2O=1) 0.79

ING DENSITY: IN APPLICABLE) Kg/m³ N/A

VAPOR PRESSURE: (mm Hg AT 20°C) 6 AT 106 F
VAPOR DENSITY (AIR = 1) 3.9

SOLUBILITY IN H2O: (% BY VOL) NIL

% VOLATILES BY VOL: 100

EVAPORATION RATE: (ETHYL ETHER = 1) SLOWER THAN

pH INFORMATION: pH N/A

OCTANOL/WATER PARTITION COEFFICIENT:

APPEARANCE AND ODOR: CLEAR LIQUID, FREE SPIRITS ODOR

ODOR THRESHOLD (ppm)

SECTION IV FIRE AND EXPLOSION DATA (CONT. ON PAGE 3)

H POINT: 135 MINIMUM TCC °F. °C. AUTOIGNITION TEMPERATURE: 560 °F. °C

NFPA CLASSIFICATION	HAZARD RATING	FLAMMABLE LIMITS IN AIR
H 1 FIRE 2 REACTIVITY 0	LEAST 0, SLIGHT 1, MODERATE 2, HIGH 3, EXTREME 4	LOWER EXPLOSIVE LEVEL (LEL) 0.7 % VO
IC HAZARD		UPPER EXPLOSIVE LEVEL (UEL) 5.7 % VO

FIRE AND EXPLOSION HAZARDS

CODE C00700

APR 11 '95 12:53 FROM C S C ENG NAPOLEON TO 92169427250 PAGE.002

EXTINGUISHING MEDIA	SPECIAL FIRE FIGHTING INSTRUCTIONS
~~OIL FOG~~ CHEMICAL FOAM, DRY CHEMICAL, CO2, Chemical foam, CO2	WEAR SELF-CONTAINED BREATHING GEAR WHEN FIGHTING FIRES IN CONFINED SPACES.

HEALTH HAZARD INFORMATION

EXPOSURE LIMITS
N. TIME WEIGHTED PERMISSIBLE EXPOSURE 100 PPM , SUB-RECOMMENDATION. Time weighted Permissible

ROUTES OF EXPOSURE AND EFFECTS
ATION Inhalation
STARING TO MUCOUS MEMBRANES, RESPIRATORY TRACT.
Irritating to Mucous Membranes

Practically Nontoxic by
CUTE: Y NON-TOXIC BY SKIN ABSORPTION. MODERATE IRRITATION WITH PROLONGED OR REPEATED CONTACT. DEFATS T
N.

ERATE IRRITATION.

ION
ERATELY TOXIC, PULMONARY ASPIRATION HAZARD IF SWALLOWED AND VOMITING OCCURS. ORAL LD50 IS ESTIMATED TO
WEEN 5.5 AND 5.5 GRAMS PER KILOGRAM OF BODY WEIGHT

FIRST AID
LATION (INJV): VICTIM TO FRESH AIR. IF NOT BREATHING, GIVE ARTIFICIAL RESPIRATION, OBTAIN PHYSICIAN.
Inhalation

H WITH SOAP AND WATER. WASH CLOTHING BEFORE REUSE.

CASE OF CONTACT, IMMEDIATELY FLUSH EYES WITH PLENTY OF WATER FOR AT LEAST 15 MINUTES. IF REDNESS OR
ITATION PERSISTS, SEEK MEDICAL HELP.

STION Ingestion
SWALLOWED, DO NOT INDUCE VOMITING. OBTAIN PHYSICIAN IMMEDIATELY. DO NOT GIVE LIQUIDS. SMALL AMOUNTS WHI
ACCIDENTALLY ENTER THE MOUTH SHOULD BE RINSED OUT UNTIL NO TASTE OF THIS PRODUCT REMAINS.

REACTIVITY DATA (CONT. ON PAGE 3)

STABILITY	INCOMPATIBLE MATERIALS	HAZARDOUS DECOMPOSITION PRODUCTS
BLE Stable	INCOMPATIBLE WITH STRONG OXIDIZERS	CARBON MONOXIDE AND ASPHYXIANTS

PRODUCT: 2513000
INVOICE: 5447303
INVOICE DATE: 09/23/86
TO: CAMPBELL SOUP CO.
3500 WEST 35TH ST.
CHICAGO IL 60632

ATTN: PLANT MGR./SAFETY DIR.

SECTION I-PRODUCT IDENTIFICATION

GENERAL OR GENERIC ID: ALIPHATIC HYDROCARBON

DOT HAZARD CLASSIFICATION: COMBUSTIBLE (173.115)

SECTION II-COMPONENTS

INGREDIENT	% (BY WT)	PEL	TLV	NOTE
ALIPHATIC PETROLEUM DISTILLATES	100	500	100 PPM	(1)

(1): NIOSH RECOMMENDS A LIMIT OF 350 MG/CUM - 8 HOUR TIME WEIGHTED AVERAGE, 1800 MG/CUM AS DETERMINED BY A 15 MINUTE SAMPLE.

SECTION III-PHYSICAL DATA

PROPERTY	REFINEMENT	MEASUREMENT
BOILING POINT	FOR PRODUCT	302.00 DEG F
		(150.00 DEG C)
VAPOR PRESSURE	FOR PRODUCT	@ 760.00 MMHG
		2.00 MMHG
SPECIFIC VAPOR DENSITY	AIR = 1	@ 65.00 DEG F
		(25.00 DEG C)
SPECIFIC GRAVITY		0.8
		.770
PERCENT VOLATILES		@ 60.00 DEG F
		(15.55 DEG C)
EVAPORATION RATE	(ETHER = 1)	128.00%
		70.00

SECTION IV-FIRE AND EXPLOSION INFORMATION

FLASH POINT: 100.00 DEG F (37.77 DEG C)

EXPLOSIVE LIMIT (PRODUCT): LOWER - 0.8%

EXTINGUISHING MEDIA: REGULAR FOAM OR CARBON DIOXIDE OR DRY CHEMICAL

HAZARDOUS DECOMPOSITION PRODUCTS: MAY FORM TOXIC MATERIALS(), CARBON DIOXIDE AND CARBON MONOXIDE, VARIOUS HYDROCARBONS, ETC.

FIREFIGHTING PROCEDURES: WEAR SELF-CONTAINED BREATHING APPARATUS WITH A FULL FACEPIECE OPERATED IN PRESSURE-DEMAND OR OTHER POSITIVE PRESSURE MODE WHEN FIGHTING FIRES.

SPECIAL FIRE & EXPLOSION HAZARDS: VAPORS ARE HEAVIER THAN AIR AND MAY TRAVEL ALONG THE GROUND OR BE MOVED BY VENTILATION AND IGNITED BY HEAT, PILOT LIGHTS, OTHER FLAMES AND IGNITION SOURCES AT LOCATIONS DISTANT FROM MATERIAL HANDLING POINT.

NEVER USE WELDING OR CUTTING TORCH ON OR NEAR DRUM (EVEN EMPTY) BECAUSE PRODUCT (EVEN JUST RESIDUE) CAN IGNITE EXPLOSIVELY.

NFPA CODES: HEALTH- 0 FLAMMABILITY- 3 REACTIVITY- 0

SECTION V-HEALTH HAZARD DATA

PERMISSIBLE EXPOSURE LEVEL: 500 PPM

THRESHOLD LIMIT VALUE: 100 PPM

EFFECTS OF ACUTE OVEREXPOSURE: FOR PRODUCT

EYES - CAN CAUSE SEVERE IRRITATION, REDNESS, TEARING, BLURRED VISION.
SKIN - PROLONGED OR REPEATED CONTACT CAN CAUSE MODERATE IRRITATION, DEFATTING, DERMATITIS.
BREATHING - EXCESSIVE INHALATION OF VAPORS CAN CAUSE NASAL AND RESPIRATORY IRRITATION, DIZZINESS, WEAKNESS, FATIGUE, NAUSEA, HEADACHE, POSSIBLE UNCONSCIOUSNESS, AND EVEN ASPHYXIATION.
SWALLOWING - CAN CAUSE GASTROINTESTINAL IRRITATION, NAUSEA, VOMITING, AND DIARRHEA. ASPIRATION OF MATERIAL INTO THE LUNGS CAN CAUSE CHEMICAL PNEUMONITIS WHICH CAN BE FATAL.

COPYRIGHT 1986

CONTINUED ON PAGE: 2

DIVISION OF ASHLAND OIL, INC.
P.O. BOX 2219, COLUMBUS, OHIO 43216 • (614) 889-3333

MATERIAL SAFETY DATA SHEET

24-HOUR EMERGENCY TELEPHONE (800) 325-1133

SECTION V-HEALTH HAZARD DATA (CONTINUED)

FIRST AID:

IF ON SKIN: THOROUGHLY WASH EXPOSED AREA WITH SOAP AND WATER. REMOVE CONTAMINATED CLOTHING. LAUNDER CONTAMINATED CLOTHING BEFORE RE-USE.

IF IN EYES: FLUSH WITH LARGE AMOUNTS OF WATER, LIFTING UPPER AND LOWER LIDS OCCASIONALLY. GET MEDICAL ATTENTION.

IF SWALLOWED: DO NOT INDUCE VOMITING. KEEP PERSON WARM, QUIET, AND GET MEDICAL ATTENTION. ASPIRATION OF MATERIAL INTO THE LUNGS DUE TO VOMITING CAN CAUSE CHEMICAL PNEUMONITIS WHICH CAN BE FATAL.

IF BREATHED, IF AFFECTED, REMOVE INDIVIDUAL TO FRESH AIR. IF BREATHING IS DIFFICULT, ADMINISTER OXYGEN. IF BREATHING HAS STOPPED GIVE ARTIFICIAL RESPIRATION. KEEP PERSON WARM, QUIET AND GET MEDICAL ATTENTION.

PRIMARY ROUTE(S) OF ENTRY:

INHALATION

SKIN CONTACT

SECTION VI-REACTIVITY DATA

HAZARDOUS POLYMERIZATION: CANNOT OCCUR

STABILITY: STABLE

INCOMPATIBILITY: AVOID CONTACT WITH:, STRONG OXIDIZING AGENTS.

SECTION VII- SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED:

SMALL SPILL: ABSORB LIQUID ON PAPER, VERMICULITE, FLOOR ABSORBENT, OR OTHER ABSORBENT MATERIAL AND TRANSFER TO HOOD.

LARGE SPILL: ELIMINATE ALL IGNITION SOURCES (FLARES, FLAMES INCLUDING PILOT LIGHTS, ELECTRICAL SPARKS). PERSONS NOT WEARING PROTECTIVE EQUIPMENT SHOULD BE EXCLUDED FROM AREA OF SPILL UNTIL CLEAN-UP HAS BEEN COMPLETED. STOP SPILL AT SOURCE. DIKE AREA OF SPILL TO PREVENT SPREADING. PUMP LIQUID TO SALVAGE TANK. REMAINING LIQUID MAY BE TAKEN UP ON SAND, CLAY, EARTH, FLOOR ABSORBENT, OR OTHER ABSORBENT MATERIAL AND SHOVELED INTO CONTAINERS. PREVENT RUN-OFF TO SEWERS, STREAMS OR OTHER BODIES OF WATER. IF RUN-OFF OCCURS, NOTIFY PROPER AUTHORITIES AS REQUIRED, THAT A SPILL HAS OCCURED.

WASTE DISPOSAL METHOD:

SMALL SPILL: ALLOW VOLATILE PORTION TO EVAPORATE IN HOOD. ALLOW SUFFICIENT TIME FOR VAPORS TO COMPLETELY CLEAR HOOD DUCT WORK. DISPOSE OF REMAINING MATERIAL IN ACCORDANCE WITH APPLICABLE REGULATIONS.

LARGE SPILL: DESTROY BY LIQUID INCINERATION.
CONTAMINATED ABSORBENT MAY BE DEPOSITED IN A LANDFILL IN ACCORDANCE WITH LOCAL, STATE AND FEDERAL REGULATIONS.

SECTION VIII-PROTECTIVE EQUIPMENT TO BE USED

RESPIRATORY PROTECTION: IF TLV OF THE PRODUCT OR ANY COMPONENT IS EXCEEDED, A NIOSH/MSHA JOINTLY APPROVED AIR SUPPLIED RESPIRATOR IS ADVISED IN ABSENCE OF PROPER ENVIRONMENTAL CONTROL. OSHA REGULATIONS ALSO PERMIT OTHER NIOSH/MSHA RESPIRATORS UNDER SPECIFIED CONDITIONS. (SEEK YOUR SAFETY EQUIPMENT SUPPLIER). ENGINEERING OR ADMINISTRATIVE CONTROLS SHOULD BE IMPLEMENTED TO REDUCE EXPOSURE.

VENTILATION: PROVIDE SUFFICIENT MECHANICAL (GENERAL AND/OR LOCAL EXHAUST) VENTILATION TO MAINTAIN EXPOSURE BELOW TLV(S).

PROTECTIVE GLOVES: WEAR RESISTANT GLOVES SUCH AS:, NITRILE RUBBER

EYE PROTECTION: CHEMICAL SPLASH GOGGLES IN COMPLIANCE WITH OSHA REGULATIONS ARE ADVISED; HOWEVER, OSHA REGULATIONS ALSO PERMIT OTHER TYPE SAFETY GLASSES. (CONSULT YOUR SAFETY EQUIPMENT SUPPLIER)

OTHER PROTECTIVE EQUIPMENT: TO PREVENT REPEATED OR PROLONGED SKIN CONTACT, WEAR IMPERVIOUS CLOTHING AND BOOTS.

SECTION IX-SPECIAL PRECAUTIONS OR OTHER COMMENTS

CONTAINERS OF THIS MATERIAL MAY BE HAZARDOUS WHEN EMPTIED. SINCE EMPTIED CONTAINERS RETAIN PRODUCT RESIDUES (VAPOR, LIQUID, AND/OR SOLID), ALL HAZARD PRECAUTIONS GIVEN IN THE DATA SHEET MUST BE OBSERVED.

THE INFORMATION ACCUMULATED HEREIN IS BELIEVED TO BE ACCURATE BUT IS NOT WARRANTED TO BE WHETHER ORIGINATING WITH THE COMPANY OR NOT. RECIPIENTS ARE ADVISED TO CONFIRM IN ADVANCE OF NEED THAT THE INFORMATION IS CURRENT, APPLICABLE, AND SUITABLE TO THEIR CIRCUMSTANCES.

UPPER EXPLOSIVE LIMIT : 12.00

EXTINGUISHING MEDIA: CARBON DIOXIDE, DRY CHEMICAL, FOAM, AND/OR WATER FOG.

SPECIAL FIRE FIGHTING PROCEDURES:
FIRE FIGHTERS MUST WEAR SELF CONTAINED BREATHING APPARATUS OR AIR MASKS.
CONTAINERS EXPOSED TO FIRE SHOULD BE KEPT COOL WITH WATER SPRAY.

UNUSUAL FIRE AND EXPLOSIVE HAZARDS:
NONE

********** SECTION 5: HEALTH HAZARD DATA

THRESHOLD LIMIT VALUE: NOT REQUIRED FOR MIXTURE.

EFFECTS OF OVEREXPOSURE:
IMMEDIATE EFFECTS (ACUTE):
CAN BE ABSORBED THROUGH THE SKIN.
HARMFUL IF INHALED. MAY AFFECT THE BRAIN, NERVOUS SYSTEM OR RESPIRATORY SYSTEM, CAUSING DIZZINESS, HEADACHE, NAUSEA OR RESPIRATORY IRRITATION.
OVEREXPOSURE TO INGREDIENTS IN THIS PRODUCT MAY CAUSE NOSE AND THROAT IRRITATION, EYE IRRITATION, EYE BURNS, SKIN IRRITATION, RESPIRATORY TRACT IRRITATION, ASTHMATIC ATTACK AND/OR REACTION, RESPIRATORY SENSITIZATIO.
DELAYED EFFECTS (CHRONIC):
CONTAINS GLYCOL ETHER WHICH HAS BEEN SHOWN TO CAUSE BLOOD EFFECTS DAMAGE IN LABORATORY ANIMALS.
NOTICE: REPORTS HAVE ASSOCIATED REPEATED AND PROLONGED OCCUPATIONAL OVEREXPOSURE TO SOLVENTS WITH PERMANENT BRAIN AND NERVOUS SYSTEM DAMAGE. INTENTIONAL MISUSE BY DELIBERATELY CONCENTRATING AND INHALING THE CONTENTS MAY BE HARMFUL OR FATAL.
CONTAINS INGREDIENTS WHICH MAY CAUSE SKIN BURNS, LIVER DAMAGE, KIDNEY DAMAGE, BLOOD DAMAGE, HEARING LOSS.

MEDICAL CONDITIONS GENERALLY AGGRAVATED BY EXPOSURE - ANY RESPIRATORY OR SKIN CONDITION.

EMERGENCY AND FIRST AID PROCEDURES:
EYE CONTACT: FLUSH IMMEDIATELY WITH PLENTY OF WATER FOR AT LEAST 15 MINUTES AND GET MEDICAL ATTENTION.
SKIN CONTACT: WASH THOROUGHLY WITH SOAP AND WATER.
CLOTHING: REMOVE CONTAMINATED CLOTHING AND SHOES. WASH CLOTHING BEFORE REUSE. DESTROY CONTAMINATED SHOES.

SECTION II - HAZARDOUS MATERIALS

INGREDIENT	WT.%	TLV (PPM)	LEL	VAPOR PRESSURE
Aliphatic Hydrocarbon	19	275	0.9	2
Aromatic Hydrocarbon	3	200	1.0	6

SECTION III - PHYSICAL DATA

BOILING RANGE: 230-296 % VOLATILE BY VOLUME: 30 WT./GAL.: (Lbs.)

EVAPORATION RATE: (X) SLOWER THAN ETHER ( ) FASTER VAPOR DENSITY (X) HEAVIER ( ) LIGHTER THA

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

DOT CATEGORY: Flam. Liq. Class II FLASH POINT: 86°F LEL: 0.9

EXTINGUISHING MEDIA: Carbon dioxide, dry chemical, foam.

UNUSUAL FIRE AND EXPLOSION HAZARDS: Keep containers tightly closed. Avoid sources of ignition. Ground all transfer equipment. Closed containers may explode when exposed to extreme heat.

SPECIAL FIRE FIGHTING PROCEDURES: Water spray (fog nozzles) may be used f cooling containers.

CONTAINER RESEARCH CONTAINER PRODUCTION

4/22/93

Pg 1

CAMPBELL CONTAINER COMPANY

R - 1 - 5B

MATERIAL SAFETY DATA SHEET
FOR COATINGS, RESINS, AND RELATED MATERIALS

SECTION V - HEALTH HAZARD DATA

THRESHOLD LIMIT VALUE: 267 ppm (weighted average of solvent mixture)

EFFECTS OF OVEREXPOSURE: Severe eye irritation. Drying of skin. Excess inhalation causes headache, dizziness, nausea.

EMERGENCY AND FIRST AID PROCEDURES: In case of skin contact, flush with plen of water: for eyes, immediately flush with water for 15 minutes and get medical attention. If exposed to high concentration of vapor, remove patient to fresh air. If swallowed, CALL A PHYSICIAN IMMEDIATELY. DO NOT induce vomiting.

SECTION VI - REACTIVITY DATA

STABILITY: ○ UNSTABLE ◉ STABLE

HAZARDOUS POLYMERIZATION: ○ MAY OCCUR ◉ WILL NOT OCCUR

INCOMPATIBILITY (Materials to avoid): Strong oxidizing agents

HAZARDOUS DECOMPOSITION PRODUCTS: As with any organic chemical, thermal decomposition will yield carbon dioxide and probably carbon monoxide.

CONDITIONS TO AVOID: None

SECTION VII - SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED: Remove sources of ignition, ventilate and remove with inert absorbent.

WASTE DISPOSAL METHOD: Incinerate in approved facility in accordance with local, state and federal regulations. Do not incinerate closed container.

SECTION VIII - SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION: NIOSH approved respiratory device may be used. But, under normally well ventilated conditions no respiratory problems may be expected.
VENTILATION: All application areas should be ventilated in accordance with OSHA regulations.
PROTECTIVE GLOVES: Recommended
EYE PROTECTION: Use approved safety eyewear with splash guards.
OTHER PROTECTIVE EQUIPMENT: Safety shower and eye bath.

SITE SERVICES - GENERAL SAFETY

I. SAFETY PRACTICES

A. PERSONAL PRECAUTIONS

--EATING, DRINKING, CHEWING GUM OR TOBACCO, SMOKING OR ANY PRACTICE THAT INCREASES THE PROBABILITY OF HAND-TO-MOUTH TRANSFER AND INGESTION OF MATERIAL IS PROHIBITED IN ANY AREA DESIGNATED CONTAMINATED.

--WHENEVER DECONTAMINATION PROCEDURES FOR OUTER GARMENTS ARE IN EFFECT, THE ENTIRE BODY SHOULD BE THOROUGHLY WASHED AS SOON AS POSSIBLE AFTER THE PROTECTIVE GARMENT IS REMOVED.

--CONTACT WITH CONTAMINATED OR SUSPECTED CONTAMINATED SURFACES SHOULD BE AVOIDED. WHENEVER POSSIBLE, DO NOT WALK THROUGH PUDDLES, LEACHATE, DISCOLORED SURFACES, KNEEL ON GROUND, LEAN, SIT, OR PLACE EQUIPMENT ON DRUMS, CONTAINERS, OR THE GROUND.

--MEDICINE AND ALCOHOL CAN POTENTIATE THE EFFECTS FROM EXPOSURE TO TOXIC CHEMICALS. PRESCRIBED DRUGS SHOULD NOT BE TAKEN BY PERSONNEL ON RESPONSE OPERATIONS WHERE THE POTENTIAL FOR ABSORPTION, INHALATION, OR INGESTION OF TOXIC SUBSTANCES EXISTS UNLESS SPECIFICALLY APPROVED BY A QUALIFIED PHYSICIAN. ALCOHOLIC BEVERAGE INTAKE SHOULD BE AVOIDED DURING RESPONSE OPERATIONS.

B. SITE SAFETY PLANS

--ALL PERSONNEL MUST BE FAMILIAR WITH STANDARD OPERATING SAFETY PROCEDURES AND ANY ADDITIONAL INSTRUCTIONS AND INFORMATION CONTAINED IN THE SITE SAFETY PLAN.

--ALL PERSONNEL MUST ADHERE TO THE INFORMATION CONTAINED IN THE SITE SAFETY PLAN.

C. OPERATIONS

--ALL PERSONNEL GOING ON-SITE MUST BE ADEQUATELY TRAINED AND THOROUGHLY BRIEFED ON ANTICIPATED HAZARDS, EQUIPMENT TO BE WORN, SAFETY PRACTICES TO BE FOLLOWED, EMERGENCY PROCEDURES, AND COMMUNICATIONS.

--ANY REQUIRED RESPIRATORY PROTECTIVE DEVICES AND CLOTHING MUST BE WORN BY ALL PERSONNEL GOING INTO AREAS DESIGNATED FOR WEARING PROTECTIVE EQUIPMENT.

--PERSONNEL ON-SITE MUST USE THE BUDDY SYSTEM WHEN WEARING RESPIRATORY PROTECTIVE EQUIPMENT. AS A MINIMUM, A THIRD PERSON, SUITABLY EQUIPPED AS A SAFETY BACKUP, IS REQUIRED DURING INITIAL ENTRIES.

--DURING CONTINUAL OPERATIONS, ON-SITE WORKERS ACT AS SAFETY BACKUP TO EACH OTHER. OFF-SITE PERSONNEL PROVED EMERGENCY ASSISTANCE.

--COMMUNICATIONS USING RADIOS, HAND SIGNALS, SIGNS, OR OTHER MEANS MUST BE MAINTAINED BETWEEN INITIAL ENTRY MEMBERS AT ALL TIMES. EMERGENCY COMMUNICATIONS SHOULD BE PREARRANGED IN CASE OF RADIO FAILURE, NECESSITY FOR EVACUATION OF SITE, OR OTHER REASONS.

--PERSONNEL AND EQUIPMENT IN THE CONTAMINATED AREA SHOULD BE MINIMIZED, CONSISTENT WITH EFFECTIVE SITE OPERATIONS.

--WORK AREAS FOR VARIOUS OPERATIONAL ACTIVITIES MUST BE ESTABLISHED.

--PROCEDURES FOR LEAVING A CONTAMINATED AREA MUST BE PLANNED AND IMPLEMENTED PRIOR TO GOING ON-SITE. WORK AREAS AND DECONTAMINATION PROCEDURES MUST BE ESTABLISHED BASED ON EXPECTED SITE CONDITIONS.

ORGANIZATION

PLANNING AND ORGANIZATION ARE IMPORTANT ELEMENTS OF ANY HAZARDOUS WASTE SITE ACTIVITY. POTENTIAL HAZARDS TO HEALTH AND SAFETY CAN BE REDUCED BY FORMULATING EFFECTIVE PLANS TO DEAL WITH HAZARDOUS OPERATIONS. THIS SITE SPECIFIC SAFETY PLAN INCLUDES AN ORGANIZATIONAL CHART THAT:

*IDENTIFIES A LEADER WHO HAS AUTHORITY TO DIRECT ALL ACTIVITIES.
*IDENTIFIES AND DEFINES RESPONSIBILITIES OF KEY PERSONNEL.
*SHOWS LINES OF AUTHORITY, RESPONSIBILITY, AND COMMUNICATION.

ALL SITE PERSONNEL WILL REVIEW THE HEALTH AND SAFETY PLAN PRIOR TO OPERATIONS. A FORM WILL BE SIGNED STATING THAT ALL SITE PERSONNEL HAVE REVIEWED THE PLAN AND ANY QUESTIONS CONCERNING THE PLAN HAVE BEEN ANSWERED.

PROJECT MANAGER: SCOTT FERRY

REVIEWS SITE HISTORY
PREPARES AND ORGANIZES WORK PLAN
SETS UP EQUIPMENT NEEDS
COORDINATES ACTIVITIES WITH APPROPRIATE OFFICIALS
BRIEFS FIELD TEAMS ON SPECIFIC ASSIGNMENTS
PREPARES REPORTS AND FILES ON ACTIVITIES
SERVES AS A LIAISON WITH PUBLIC AFFAIRS

HEALTH AND SAFETY COORDINATOR: TAMERA TUCK

REVIEWS SITE HISTORY INCLUDING SITE HAZARDS
DEVELOPS SITE SPECIFIC HEALTH AND SAFETY PLAN
COORDINATES ACTIVITIES WITH PROJECT SUPERVISOR
IMPLEMENTS HEALTH AND SAFETY INCLUDING PERIODIC INSPECTIONS

PROJECT SUPERVISOR: MIKE COLE

MANAGER OF FIELD OPERATIONS
EXECUTES WORK PLAN AND SCHEDULE
ENFORCES SAFETY PROCEDURES
DOCUMENTS FIELD AND SITE ACTIVITIES
REPORTS TO PROJECT MANAGER
MONITORS ON SITE CONDITION
DETERMINES LEVEL OF PROTECTION TO BE USED ON A DAILY BASIS
ENSURE PROPER USE OF PPE
CONDUCTS DAILY SAFETY MEETINGS
CONDUCTS AIR MONITORING AND DECONTAMINATION OF SAFETY
ACTIVITIES INITIATES EMERGENCY RESPONSE AND FIRST AID
TREATMENT REPORTS ALL ACCIDENTS AND INCIDENTS TO PROJECT MANAGER

EMERGENCY RESPONSE TEAM:

THE EMERGENCY RESPONSE TEAM IS FAMILIAR WITH EMERGENCY PROCEDURES EVACUATION ROUTES AND CONTINGENCY PLANS. ALSO FIRST RESPONDERS TO SPILLS, ACCIDENTS, OR ANY OTHER EMERGENCIES AS DIRECT BY PROJECT SUPERVISOR.

TRAINING PROGRAM

ALL GREAT LAKES RESPONSE PERSONNEL HAVE BEEN TRAINED IN PROPER SAFETY PROCEDURES. ALL PERSONNEL ENTERING THE WORK SITE WILL BE INFORMED OF THE POSSIBLE DANGERS AND LONG TERM HAZARDS KNOWN TO BE PRESENT AT THIS SITE.

THE PURPOSE:

1. TO MAINTAIN SAFE WORK HABITS AMONG THE WORK CREW.
2. TO TRAIN AND INFORM PERSONNEL INVOLVED WITH THE PROJECT OF THE HAZARDS PRESENT AT THIS SITE.

ALL GREAT LAKES RESPONSE PERSONNEL HAVE BEEN TRAINED IN CLASSROOM INSTRUCTIONS TO INCLUDE:

1. OSHA 40 HOUR HEALTH AND SAFETY PROGRAM
2. 40 HOUR CONFINED SPACE ENTRY & RESCUE TRAINING
3. RED CROSS FIRST AIR AND CPR
4. RESPIRATORY PROTECTION
5. PROTECTIVE CLOTHING
6. USE OF SAFETY EQUIPMENT
7. DECONTAMINATION PROCEDURES
8. BASIC CHEMICAL CONCEPTS AND HAZARDOUS PROPERTIES

IN ADDITION TO CLASSROOM INSTRUCTION, GREAT LAKES RESPONSE FIELD EMPLOYEES RECEIVE "HANDS ON" AND "ON THE JOB" TRAINING AS WELL AS, ANNUAL REFRESHERS IN KEY AREAS OF SAFETY.

SITE SPECIFIC TRAINING WILL INCLUDE INFORMATION TO ENSURE THAT THE PERSONNEL WORKING AT THE SITE ARE ABLE TO RESPOND EFFECTIVELY TO EMERGENCIES. THIS SEGMENT OF THE TRAINING WILL INCLUDE A DESCRIPTION OF THE COMMUNICATION SYSTEMS TO BE USED.

MEDICAL SURVEILLANCE PROGRAM

A MEDICAL SURVEILLANCE HAS BEEN IMPLEMENTED FOR ALL EMPLOYEES WHO ARE INVOLVED IN THE REMEDIATION OF HAZARDOUS WASTE SITES. THIS PROGRAM HELPS TO:

*ASSURE THE EMPLOYEE IS MEDICALLY SOUND AND IS ABLE TO WEAR THE PERSONNEL PROTECTIVE EQUIPMENT WHICH IS REQUIRED OF THESE KINDS OF SITES (29 CFR 1910.138 [B] [10]).

*IDENTIFY ANY ILLNESS OR CONDITIONS THAT MIGHT BE AGGRAVATED BY EXPOSURES OR JOB ACTIVITIES.

*ESTABLISH A BASELINE TO EVALUATE FUTURE CHANGES IN HEALTH.

*TO RECOGNIZE CHANGES, REACTIONS, OR ABNORMALITIES AT THE EARLIEST OPPORTUNITY SO THAT CORRECTIVE MEASURES CAN BE TAKEN.

ALL MEDICAL SURVEILLANCE SHALL BE PERFORMED BY A BOARD CERTIFIED OCCUPATIONAL HEALTH PHYSICIAN OR EQUIVALENT. GREAT LAKES RESPONSE EMPLOYEES PHYSICALS ARE NORMALLY PERFORMED BY:

MENTOR MEDNET
9000 MENTOR AVE.
MENTOR, OHIO 44060
216-974-4155

ALL PHYSICALS ARE DONE IN ACCORDANCE WITH 29 CFR 1910.138 [B] [10] AND SHALL INCLUDE THE FOLLOWING:

*COMPLETE MEDICAL AND OCCUPATIONAL/MEDICAL HISTORY AND PHYSICAL EXAM BY PHYSICIAN; INCLUDES TITMUS VISION TEST (OSHA APPROVED); INCLUDES VISUAL ACUITY FOR DISTANCE, NEAR, DEPTH AND COLOR VISION
*DIPSTICK URINALYSIS (SCREENS FOR DIABETES AND KIDNEY DISEASE)
*SCREENING AUDIO GRAM (OSHA APPROVED)
*SPIROMETRY (PULMONARY FUNCTION TEST)
*CBC WITH DIFFERENTIAL (BLOOD TEST)
*SMAC 19 (TESTS FOR 19 DIFFERENT BLOOD CHEMISTRIES)
*MICROSCOPIC URINALYSIS
*EKG
*CHEST X-RAY (INITIAL THEN AT M.D.'S DISCRETION)

SITE CONTROL

IT IS OF THE UTMOST IMPORTANCE TO ESTABLISH SITE CONTROL IN ORDER TO ENSURE THAT ALL PERSONNEL ARE PROPERLY PROTECTED AGAINST THE HAZARDS OF EACH PROJECT. ALSO TO DEFINE WHAT IS CONTAMINATED AND CONFINE THE CONTAMINATION.

IN ORDER TO ACCOMPLISH THIS, THE SITE MUST BE DIVIDED INTO THE FOLLOWING AREA.

* HOT ZONE
* CONTAMINATION REDUCTION ZONE
* CONTAMINATION REDUCTION CORRIDOR
* DECON ZONE
* SUPPORT ZONE - WHICH IS NOT CONTAMINATED AND PERSONS ARE SAFE WITHOUT PPE.

HOT ZONE

THIS IS THE AREA OF CONTAMINATION WHERE IT IS ESSENTIAL FOR ALL PERSONS IN THIS AREA TO BE FULLY PROTECTED FROM THE ENVIRONMENT THEY MAY BE IN. THE HOT ZONE WILL BE IDENTIFIED BY BARRIER TAPE.

CONTAMINATION REDUCTION ZONE

THE CONTAMINATION RED ZONE IS THE BUFFER BETWEEN THE HOT ZONE AND THE SUPPORT ZONE.

CONTAMINATION REDUCTION CORRIDOR

THE CONTAMINATION REDUCTION CORRIDOR IS THE ENTRANCE AND EXIT FROM THE HOT ZONE TO THE SUPPORT ZONE ALONG THIS CORRIDOR YOU WILL FIND A STATION FOR THE DECONTAMINATION OF EQUIPMENT, AS WELL AS, PERSONNEL EMERGENCY RESPONSE EQUIPMENT, MONITORING EQUIPMENT, PPE, AND SUPPLIES SHOULD ALSO BE MADE AVAILABLE ALONG THIS ROUTE.

SUPPORT ZONE

THE SUPPORT ZONE IS THE LOCATION OF ALL SUPPORT FUNCTIONS WHICH ARE NEEDED TO ALLOW THE OPERATIONS IN THE HOT ZONE AND CONTAMINATION REDUCTION ZONE TO RUN SMOOTHLY. THIS IS AN AREA WITHOUT CONTAMINATION, AND THE HEALTH AND SAFETY OF ALL PERSONNEL MUST NOT BE THREATENED IN THIS AREA.

PERSONAL PROTECTION EQUIPMENT

ALL SITE PERSONNEL MUST BE ADEQUATELY PROTECTED FROM POTENTIAL HEALTH AND SAFETY HAZARDS AT THE SITE. A SUFFICIENT AND DIVERSE INVENTORY OF ALL SAFETY EQUIPMENT AND PERSONAL PROTECTION EQUIPMENT NECESSARY TO MEET ANTICIPATED HAZARDS WILL BE AVAILABLE ON THE SITE TO ALL EMPLOYEES. THE PERSONNEL AND SITE VISITORS MUST BE INSTRUCTED IN THE PROPER USE OF THIS EQUIPMENT BEFORE ENTRY TO THE WORK AREA IS PERMITTED.

PRELIMINARY DETERMINATION - LEVELS OF PROTECTION

WHEN WORKING AT THE CAMPBELL SOUP SITE, ALL GREAT LAKES PERSONNEL WILL WEAR A MINIMUM OF THE FOLLOWING:

* WORK UNIFORM
* HARD HAT
* SAFETY GLASSES
* STEEL TOE BOOTS

BASED ON THE AVAILABLE INFORMATION, GREAT LAKES RESPONSE PERSONNEL WILL USE THE LEVELS OF PROTECTION DESCRIBED ON THE FOLLOWING PAGES DURING SITE ACTIVITIES BASED UPON AMBIENT AIR MONITORING.

HOT ZONE
PERSONAL PROTECTIVE EQUIPMENT

LEVEL "B"

LEVEL "B" PROTECTION IS REQUIRED WHEN ANY OF THE FOLLOWING CRITERIA ARE MET:

1. THE ATMOSPHERE CONTAINS LESS THAN 19.5% OXYGEN.
2. THE TYPES OF ATMOSPHERIC CONCENTRATIONS OF TOXIC SUBSTANCES HAVE BEEN IDENTIFIED AND REQUIRE THE HIGHEST LEVEL OF RESPIRATORY PROTECTION, BUT A LOWER LEVEL OF SKIN AND EYE PROTECTION.

ADDITIONAL REQUIREMENT:

1. AN ATMOSPHERE THAT IS I.D.L.H. OR EXCEEDS THE LIMITS OF PROTECTION AFFORDED BY A FULL FACE AIR PURIFYING RESPIRATOR.

LEVEL "B" PROVIDES THE HIGHEST LEVEL OF RESPIRATORY PROTECTION, BUT A LESSER LEVEL OF SKIN PROTECTION AND CONSISTS OF:

A. PRESSURE DEMAND FULL FACE PIECE S.C.B.A. OR PRESSURE DEMAND SUPPLIED AIR RESPIRATOR WITH A HIP PACK OR ESCAPE S.C.B.A.

B. HOODED CHEMICAL RESISTANT SPLASH SUIT OR COVERALLS

C. INNER AND OUTER CHEMICAL RESISTANT GLOVES

D. HARD HAT

OPTIONS:

A. TWO WAY RADIO COMMUNICATIONS

B. FACE SHIELD

C. LONG COTTON UNDERWEAR

D. SEALING TAPE

CONTAMINATION REDUCTION ZONE

PERSONAL PROTECTIVE EQUIPMENT
LEVEL "C"

LEVEL "C" PROTECTION IS PERMITTED WHEN ALL OF THE FOLLOWING CRITERIA ARE MET:

1. OXYGEN CONTENT OF THE ATMOSPHERE IS AT LEAST 19.5% OXYGEN
2. SUBSTANCE(S) IS IDENTIFIED AND ITS CONCENTRATION(S) IS MEASURED.
3. SUBSTANCE(S) HAS ADEQUATE WARNING PROPERTIES.
4. THE INDIVIDUAL PASSES A QUALITATIVE FIT TEST FOR MASK.
5. ATMOSPHERIC CONTAMINATE CONCENTRATIONS DO NOT EXCEED I.D.L.H. LEVELS.
6. MEASURED AIR CONCENTRATIONS OF IDENTIFIED SUBSTANCES WILL BE REDUCED BY THE RESPIRATOR TO LEVELS AT OR BELOW EXPOSURE LIMITS.

LEVEL "C" PROVIDES AIR PURIFYING RESPIRATORY PROTECTION TOGETHER WITH SKIN PROTECTION AND CONSISTS OF:

A. FULL FACE AIR PURIFYING CANISTER EQUIPPED RESPIRATOR

B. HOOD CHEMICAL RESISTANT SUIT

C. INNER AND OUTER CHEMICAL RESISTANT GLOVES

D. STEEL TOE AND SHANK CHEMICAL RESISTANT BOOTS

OPTIONS:

A. HARD HAT

B. FACE SHIELD

C. SEALING TAPE

SUPPORT ZONE
PERSONAL PROTECTIVE EQUIPMENT
LEVEL "D"

LEVEL "D" PROTECTION IS PERMITTED WHEN THE FOLLOWING CRITERIA IS MET:

1. NO HAZARDOUS AIR POLLUTANTS HAVE BEEN MEASURED.
2. WORK FUNCTIONS PRECLUDE SPLASHES, IMMERSION, OR POTENTIAL FOR UNEXPECTED INHALATION OF ANY CHEMICALS.

LEVEL "D" PROVIDES NO RESPIRATORY PROTECTION AND ONLY MINIMAL SKIN PROTECTION AND CONSISTS OF:

A. WORK UNIFORM OR COVERALLS

B. STEEL TOE AND SHANK BOOTS

C. SAFETY GOGGLES OR SAFETY GLASSES

OPTIONS:

A. HARD HAT

B. FACE SHIELD

CONFINED SPACE ENTRY

NO EMPLOYEE SHALL ENTER INTO ANY CONFINED SPACE UNLESS PROPERLY TRAINED AND UNDER THE DIRECT SUPERVISION OF A QUALIFIED SUPERVISOR.
NO EMPLOYEE SHALL ENTER INTO ANY CONFINED SPACE UNLESS A CONFINED SPACE ENTRY PERMIT HAS BEEN AUTHORIZED AND ISSUED.
A CONFINED SPACE IS DEFINED AS ANY AREA WITH RESTRICTED ENTRANCE OR EXIT.
IF POSSIBLE, ALL HAZARDS WILL BE ELIMINATED OR REDUCED BY THE USE OF ENGINEERING CONTROLS.
PRIOR TO ENTRY INTO A CONFINED SPACE, ALL PERSONNEL WILL BE BRIEFED ON HAZARD RECOGNITION AND RESCUE PROCEDURES.
THE MINIMUM NUMBER OF PERSONNEL REQUIRED FOR CONFINED SPACE ENTRY IS ONE SUPERVISOR AND TWO TECHNICIANS.

1.) PRIOR TO ANY CONFINED SPACE ENTRY, A "CONTROL ZONE" OR BOUNDARY WILL BE ESTABLISHED BY THE FIELD TEAM LEADER.

2.) PRIOR TO ENTRY INTO A CONFINED SPACE, THE INTERIOR OF THE SPACE WILL BE MONITORED FOR THE FOLLOWING ATMOSPHERIC HAZARDS: OXYGEN DEFICIENCY (<19.5% O2), COMBUSTIBLE GASES OR VAPORS (>10% L.E.L.), AND TOXIC GASES.
NOTE: THE PRESENCE OF ANY OF THE ABOVE WOULD REQUIRE SPACE VENTILATION.

3.) AT THIS POINT, A CONFINED SPACE ENTRY PERMIT SHOULD BE FILLED OUT AND POSTED. THE PERMIT SHOULD BE POSTED IMMEDIATELY ADJACENT TO ALL ENTRY PORTS AND VISIBLE TO EMERGENCY RESCUE PERSONNEL.

4.) PERSONNEL DESIGNATED TO CARRY OUT CONFINED SPACE ENTRY PROCEDURE SHOULD:
   A. BE PROPERLY TRAINED ON THE USE OF EMERGENCY RESCUE EQUIPMENT.
   B. BE PROPERLY TRAINED ON CONFINED SPACE ENTRY.
   C. BE PROPERLY TRAINED IN THE USE OF SUPPLIED BREATHING AIR.
   D. BE FAMILIAR WITH THE CONFINED SPACE ENTRY PERMIT.

5.) ANY AND ALL EQUIPMENT TO BE USED SHOULD BE INSPECTED PRIOR TO ENTRY INTO THE SPACE. SPECIAL PRECAUTIONS MUST BE TAKEN WHEN ENTERING A FLAMMABLE OR COMBUSTIBLE ATMOSPHERE.
   A. ALL ELECTRIC TOOLS OR EQUIPMENT MUST BE LOW VOLTAGE AND EXPLOSION PROOF.
   B. ALL METALLIC TOOLS MUST BE MADE OF NON SPARKING MATERIAL UNLESS AUTHORIZED BY THE FIELD TEAM LEADER.
   C. WHEN PUMPING OUT FLAMMABLE MATERIAL, PRECAUTIONS MUST BE MADE TO ENSURE ALL TANKS, DRUMS, PUMPS, ETC. ARE PROPERLY GROUNDED.

6.) PRIOR TO CONFINED SPACE ENTRY, THE SAFETY MAN (ATTENDANT) WILL, IN WRITING, POST THE NAME(S) OF ENTRY PERSONNEL ALONG WITH THE TIME AND AMOUNT OF AIR IN THE SUPPLY BOTTLES.

7.) THE SAFETY MAN (ATTENDANT) WILL AT ALL TIMES MAINTAIN CONTACT WITH PERSONNEL INSIDE THE CONFINED SPACE BY USE OF A RETRIEVAL LINE.
NOTE: VISUAL AND VOICE CONTACT WILL BE MAINTAINED WHEN AT ALL POSSIBLE.

8.) THE SAFETY OF PERSONNEL WORKING WITHIN A CONFINE SPACE IS THE DIRECT RESPONSIBILITY OF THE SAFETY PERSON(S). IF FOR ANY REASON THE SAFETY WATCH MUST LEAVE HIS STATION, ALL PERSONNEL INSIDE THE CONFINED SPACE MUST EXIT IMMEDIATELY.

9.) UNDER NO CIRCUMSTANCE IS THE SAFETY WATCH (ATTENDANT) TO ENTER THE CONFINED SPACE TO PERFORM RESCUE PROCEDURES.

10.)UPON COMPLETION OF THE CONFINED SPACE ENTRY, THE ENTRY PERMIT IS TO BE RETURNED TO THE SITE SERVICE SUPERVISOR TO BE KEPT AS HIS PERMANENT RECORD.

RESPIRATORY PROTECTION PROGRAM

GREAT LAKES RESPONSE RESPIRATORY PROTECTION PROGRAM HAS BEEN INSTALLED TO PROTECT THE SAFETY AND HEALTH OF ITS FIELD EMPLOYEES.

1.) PRIOR TO WORK ON SITE, DOCUMENTED APPROVAL WILL BE OBTAINED FOR CONTRACTOR EMPLOYEES TO USE A RESPIRATOR. THIS APPROVAL WILL BE OBTAINED FROM THE PHYSICIAN THAT HAS CONDUCTED THE PHYSICAL EXAMINATION (INCLUDING AN EXAMINATION OF THE PULMONARY FUNCTION) FOR EACH EMPLOYEE.

2.) THE TRAINING PROGRAM EDUCATES SITE PERSONNEL IN THE PROPER OPERATIONS OF THE RESPIRATORY EQUIPMENT, AS WELL AS, ITS LIMITATIONS. ON-SITE AIR MONITORING WILL BE PERFORMED TO ASSIST IN THE SELECTION OF THE PROPER SAFETY EQUIPMENT TO BE WORN.

3.) ONLY NIOSH APPROVED RESPIRATORS WILL BE USED. RESPIRATORS WILL BE SELECTED ACCORDING TO THE OSHA AND ANSI STANDARDS, AS WELL AS, WORK-CASE CONDITIONS ANTICIPATED FOR EACH PARTICULAR WORK PERIOD.

4.) INSTRUCTION AND TRAINING

A.) MEDICAL APPROVAL. THIS APPROVAL DOCUMENT WILL BE AVAILABLE TO THE CLIENT UPON REQUEST.

B.) RESPIRATOR FITTING. THE PROJECT SUPERVISOR WILL CONDUCT THE FIT TESTING.

C.) EMPLOYEE INSTRUCTION. THE USERS ARE INSTRUCTED AS TO THE USAGE, LIMITATIONS AND CLEANING PROCEDURE OF THE RESPIRATOR BEFORE THEY ARE ALLOWED TO START WORK. SITE PERSONNEL WILL BE ADVISED DURING THE DAILY SAFETY MEETINGS AS TO THE TYPE OF AIR CONTAMINANT THEY ARE BEING PROTECTED AGAINST FOR EACH PHASE OF THE OPERATION.

5.) EMPLOYEES WILL BE RESPONSIBLE FOR INSURING THAT THE RESPIRATOR IS FUNCTIONING PROPERLY PRIOR TO EACH DAY OF USE.

6.) AIR-LINE OR SCBA RESPIRATORY EQUIPMENT WILL BE INSPECTED DAILY. SPARE CYLINDERS FOR THIS EQUIPMENT WILL BE KEPT ON SITE ALSO BREATHING AIR CYLINDERS WILL BE CHECKED FOR OXYGEN AND POSSIBLE TOXIC GASES.

AIR MONITORING

PURPOSE:

AIR AND PERSONNEL MONITORING WILL BE CONDUCTED ON THIS SITE.

* TO INSURE PROPER SELECTION OF PERSONAL PROTECTION EQUIPMENT
* TO DELINEATE AREAS WHERE PROTECTION IS NEEDED
* ASSESS THE POTENTIAL HEALTH EFFECTS OF EXPOSURE
* TO DETECT ANY OFF SITE MIGRATION OF AIRBORNE CONTAMINATES

PROCEDURE:

DIRECT READING INSTRUMENTS WILL BE USED TO GIVE IMMEDIATE INFORMATION CONCERNING LEVELS OF CONTAMINATES. THESE SHALL INCLUDE:

1.) A COMBUSTIBLE GAS/OXYGEN DETECTOR FOR DETECTION OF FLAMMABLE OR EXPLOSIVE ATMOSPHERE AND OXYGEN DEFICIENCY (DYNAMATION CGM).

2.) THE DIRECT READING INSTRUMENT TO BE USED IS THE MICROTIP FOR DETECTION OF VOLATILE ORGANIC COMPOUNDS (HL-200).

3.) COLORIMETRIC INDICATOR TUBES FOR DETECTION OF SPECIFIC GASSES (DRAGGER).

ALL INSTRUMENTS WILL BE CALIBRATED TO THE MANUFACTURERS SPECIFICATIONS BEFORE USE, AND WILL BE OPERATED BY AN INDIVIDUAL WHO IS FAMILIAR WITH THE DEVICES OPERATING PROCEDURES. ALL RESULTS WILL BE KEPT IN A MONITORING LOG FOR CURRENT AND FUTURE USE.

DECONTAMINATION

PURPOSE:

TO ENSURE THAT PERSONNEL OR EQUIPMENT IN THE CONTAMINATED ZONE DO NOT SPREAD OR CARRY HAZARDOUS MATERIAL INTO A CLEAN ZONE.

OBJECTIVE:

BY SETTING UP A ZONE OF REDUCTION OR DECONTAMINATION AND FOLLOWING ESTABLISHED PROCEDURES ALL PERSONNEL WILL BE DECONTAMINATED BEFORE A TOTAL EXIT FROM THE CONTAMINATION ZONE OCCURS.

GREAT LAKES RESPONSE PERSONNEL AT THE CAMPBELL SOUP SITE WILL PROVIDE DECONTAMINATION OF PERSONNEL AND EQUIPMENT AS DESCRIBED ON THE FOLLOWING PAGES.

DECONTAMINATION PROCEDURES CAN BE MODIFIED AS NEEDED TO REFLECT THE SPECIFIC CIRCUMSTANCES WHICH ULTIMATELY DICTATES THE LEVELS OF DECONTAMINATION REQUIRED WHICH VARY WITH THE DEGREE AND NATURE OF CONTAMINATES. THE SITE SAFETY OFFICER IS THE ONLY PERSON WITH AUTHORITY TO MODIFY SITE SAFETY PROCEDURES.

LEVEL B DECONTAMINATION

PROCEDURE FOR FULL DECONTAMINATION

STATION 1: EQUIPMENT DROP

DEPOSIT EQUIPMENT USED ON-SITE (TOOLS, SAMPLING DEVICES AND, MONITORING INSTRUMENTS, RADIOS, ETC.) ON PLASTIC DROP CLOTHS. THESE ITEMS MUST BE DECONTAMINATED OR DISCARDED AS WASTE PRIOR TO REMOVAL FROM THE EXCLUSION ZONE.

STATION 2: OUTER BOOT AND OUTER GLOVE WASH AND RINSE

SCRUB OUTER BOOTS, OUTER GLOVES AND/OR SPLASH SUIT WITH DECONTAMINATION SOLUTION OR DETERGENT WATER. RINSE OFF USING WATER.

STATION 3: OUTER BOOT AND GLOVE REMOVAL

REMOVE OUTER BOOTS AND GLOVES. IF OUTER BOOTS ARE DISPOSABLE, DEPOSIT IN CONTAINER WITH PLASTIC LINER. IF NON-DISPOSABLE, STORE IN A CLEAN, DRY PLACE

STATION 4: OUTER GARMENT REMOVAL

REMOVE CHEMICAL RESISTANT OUTER GARMENTS AND DEPOSIT IN CONTAINER LINED WITH PLASTIC. DECONTAMINATE OR DISPOSE OF SPLASH SUITS AS NECESSARY.

STATION 5: RESPIRATORY PROTECTION REMOVAL

REMOVE HARDHAT, FACEPIECE, AND IF APPLICABLE, DEPOSIT ON A CLEAN SURFACE. APR CARTRIDGES WILL BE DISCARDED AS APPROPRIATE. WASH AND RINSE RESPIRATOR AT LEAST DAILY. WIPE OFF AND STORE RESPIRATORY GEAR IN A CLEAN, DRY LOCATION.

STATION 6: INNER GLOVE REMOVAL

REMOVE INNER GLOVES. DEPOSIT IN CONTAINER FOR DISPOSAL.

STATION 7: FIELD WASH

THOROUGHLY WASH HANDS AND FACE WITH SOAP AND WATER. SHOWER AS SOON AS POSSIBLE.

OTHER AREAS OF DECONTAMINATION

A.) WHEN EXITING FOR BREAKS, REST ROOMS, LUNCH OR ANY OTHER TIME IT IS NECESSARY TO EXIT THE CONTAMINATION ZONE, GREAT LAKES RESPONSE PERSONNEL WILL FOLLOW THESE PROCEDURES:

1.) IF THERE IS HEAVY CONTAMINATION, THE EMPLOYEE WILL PROCEED THROUGH TOTAL DECONTAMINATION BEFORE EXITING.

2.) IF THERE IS NOT HEAVY CONTAMINATION, THE CONTRACTORS EMPLOYEES WILL GO THROUGH DECONTAMINATION DOWN TO REMOVAL OF TYVEKS, BOOTS, GLOVES AND THEN PROCEED TO WASH HIS/HER FACE, NECK, HANDS AND ARMS BEFORE MOVING TO THE BREAK AREA.

B.) EXITS FOR MAJOR EMERGENCIES - DURING PERIOD OF MAJOR EMERGENCIES (LIFE OR HEALTH THREATENING CIRCUMSTANCES). WHEN EXITING FROM THE CONTAMINATED ZONE, IT WILL BE NECESSARY FOR GREAT LAKES RESPONSE PERSONNEL TO FOLLOW THESE PROCEDURES. (SEE CONTINGENCY PLAN)

1.) THE WORKER WILL GO THROUGH GROSS DECONTAMINATION; DROP OUTER GARMENTS IN THE AREA AND RECEIVE FIRST AID AT THAT TIME.

2.) IF THE ACCIDENT IS NOT SERIOUS, OFTEN THE WORKER IS TREATED AND THEY WILL RETURN TO THE CONTAMINATED AREA AFTER REDRESSING.

3.) IF THE ACCIDENT IS SERIOUS, THE WORKER WILL BE IMMEDIATELY TRANSPORTED TO THE HOSPITAL.

C.) EQUIPMENT DECONTAMINATION

ANY EQUIPMENT THAT CAN BE DECONTAMINATED (SOME HAND TOOLS CANNOT BE AND WILL BE DISPOSED OF) WILL BE SCRAPED IN THE CONTAMINATION ZONE TO REMOVE GROSS CONTAMINATION. IT WILL THEN BE BROUGHT TO THE DECON PAD AND WASHED WITH DECON SOLUTIONS, RINSED AND FINALLY STEAM CLEANED, TO ENSURE TOTAL DECONTAMINATION.

CONTINGENCY PLANS

CONTINGENCY PLANS FOR A VARIETY OF SITUATIONS ARE PRESENTED BELOW. THESE PLANS ARE STRUCTURED AROUND SPECIFIC SITUATIONS WHICH COULD OCCUR DURING THE PROJECT. A LIST OF LOCAL POLICE, FIRE AND OTHER EMERGENCY PHONE NUMBERS WILL BE POSTED AT THE JOB SITE, AS WELL AS A MAP WITH DIRECTIONS TO THE NEAREST MEDICAL FACILITY. THIS INFORMATION WILL BE REVIEWED WITH THE CREW PRIOR TO THE START OF OPERATIONS.

A.) CONTINGENCY PLANS FOR ON-SITE

1.) PHYSICAL INJURY TO EMPLOYEE

*FOR MINOR INJURIES, ROUTINE FIRST AID PROCEDURES WILL BE USED.
*FOR MAJOR INJURIES, AN AMBULANCE WILL IMMEDIATELY BE CALLED, FIRST AIDES WILL GET INFORMATION ABOUT THE NATURE OF THE INJURY FROM THE VICTIM, IF THE VICTIM IS CONSCIOUS.
*IF THE VICTIM IS UNCONSCIOUS, THOSE PROVIDING FIRST AID ASSISTANCE WILL CHECK FOR VITAL SIGNS.
*IN THE EVENT OF CESSATION OF BREATHING AND/OR CESSATION OF HEARTBEAT, APPROPRIATELY TRAINED (QUALIFIED) FIRST AIDES WILL ADMINISTER CARDIOPULMONARY RESUSCITATION.
*IN THE EVENT OF BLEEDING, BROKEN BONES, SHOCK, BURNS, HEAT EXHAUSTIONS, HEAT STROKE, SEIZURE, INSECT STING, ETC., THE FIRST AID TRAINED PERSONNEL ON SITE WILL EVALUATE THE SITUATION, ADMINISTER APPROPRIATE TEMPORARY AID AND TRANSPORT THE VICTIM THROUGH THE CONTAMINATION REDUCTION CORRIDOR AND SUMMON ASSISTANCE FROM THE LOCAL FIRE DEPARTMENT. IF THE INJURIES ARE SEVERE ENOUGH THAT MOVING THE VICTIM MAY AGGRAVATE THE INJURIES, THE FIRST AIDERS WILL NOT MOVE THE VICTIM UNLESS THERE IS IMMEDIATE DANGER FROM SURROUNDING CONDITIONS. MODIFIED DECONTAMINATION WILL BE PERFORMED UNLESS DOING SO WOULD FURTHER THREATEN THE VICTIMS LIFE OR HEALTH.

2.) LOCALIZED FIRE

*SOUND ALARM/NOTIFY PERSONNEL
*CALL SECURITY NOTIFY FIRE DEPARTMENT
*IMMEDIATELY NOTIFY CONTRACTING OFFICER
*MOVE ALL PEOPLE IN THE AREA UPWIND, AT A SAFE DISTANCE
*DECIDE WHETHER OR NOT IF WOULD BE ADVISABLE TO

ATTEMPT INITIAL FIGHTING OF THE FIRE
*IF DEEMED ADVISABLE TO ATTEMPT FIGHTING OF THE FIRE, THEN DO SO WITH THE MOST APPROPRIATE MEANS, I.E., WATER FOGGING, FOAM, HALON EXTINGUISHERS, COVERING WITH SOIL.
*ADVISE AND DIRECT THE FIRE DEPARTMENT UPON ARRIVAL OF THE NATURE OF THE FIRE.
*ASSIST THE FIRE DEPARTMENT IF REQUESTED, I.E. WITH DIRT MOVING
*AS SOON AS THE FIRE IS EXTINGUISHED, CLEAN UP ANY SPILLED MATERIAL, CONTAMINATED RUN-OFF OR SOIL. CONTAINERIZE AND DISPOSE OF THIS MATERIAL PROPERLY.

3.) UNCONTROLLED FIRE RELEASING TOXIC GASES

*SOUND ALARM NOTIFY PERSONNEL
*CALL SECURITY NOTIFY FIRE DEPARTMENT
*MOVE ALL PEOPLE IN THE AREA UPWIND, A SAFE DISTANCE
*RENDER FIRST AID TO ANY NEEDING IT
*CALL THE POISON CONTROL CENTER
*NOTIFY THE POLICE, STATE AND USEPA
*IMMEDIATELY NOTIFY CONTRACTING OFFICER
*NOTIFY ALL POSSIBLE DOWNWIND ENTITIES THAT WILL BE AFFECTED, PLACES OF EMPLOYMENT, AIRPORT, ETC.
*STAND BY TO ASSIST THE FIRE DEPARTMENT WITH INFORMATION ABOUT THE NATURE OF THE MATERIAL ON

FIRE, THE NATURE OF THE TOXIC GASES, THE SITE, WITH HEAVY EQUIPMENT, WITH SPECIALIZED EQUIPMENT, (I.E. CHEMICAL SUITS, DECONTAMINATION UNIT, ETC.)
*AS SOON AS THE FIRE IS EXTINGUISHED, CLEAN UP ANY SPILLED MATERIAL AND CONTAMINATED RUN-OFF OR SOIL, CONTAINERIZE AND DISPOSE OF PROPERLY.

SPILL CONTROL

FOR THE DURATION OF THE REMEDIAL OPERATIONS, THE CONTRACTOR WILL HAVE ON SITE THE PROPER EQUIPMENT AND TRAINED PERSONNEL TO ENACT GENERAL OR SPECIFIC EMERGENCY MEASURES REQUIRED TO CONTAIN AND REMOVE ANY MATERIALS, SOILS, SLUDGES OR LIQUIDS THAT BECOME CONTAMINATED DUE TO SPILLAGE. ALL COLLECTED MATERIAL OF THIS NATURE WILL BE PROPERLY CONTAINERIZED AND ANALYZED TO DETERMINE PROPER DISPOSAL METHODS. ALL SPILLED MATERIALS WILL BE PROPERLY CONTAINERIZED IN DRUMS OR TRUCKS, AND TRANSPORTED FOR ON SITE STORAGE OR TREATMENT WITH SIMILAR MATERIALS.

EMPLOYEE RISK NOTIFICATION INFORMATION
SOME OF THE RISKS YOU FACE

HEAVY NAPTHA:

EXTINGUISHING MEDIA:
CHEMICAL FOAM, DRY CHEMICAL. CO_2 .

HEALTH HAZARD INFORMATION:
TIME WEIGHTED PERMISSIBLE EXPOSURE 100 PPM.

ROUTES OF EXPOSURE:
INHALATION IRRITATING TO MUCOUS MEMBRANES.

PRACTICALLY NONTOXIC BY SKIN ABSORPTION. MODERATE IRRITATION WITH PROLONGED OR REPEATED CONTACT.

REACTIVITY DATA:
STABLE

INCOMPATIBLE MATERIALS:
INCOMPATIBLE WITH STRONG OXIDIZERS.

HAZARDOUS DECOMPOSITION PRODUCTS:
CARBON MONOXIDE AND ASPHYXIANTS.

POLYMERIZATION: WILL NOT OCCUR.

VENTILATION:
TO BREATHING RISK OR VAPORS. USE ONLY WITH ADEQUATE VENTILATION. VENTILATE AS NEEDED TO MAINTAIN COMPLIANCE WITH WORK SPACE ENVIRONMENTAL EXPOSURE LIMITS.

PERSONAL PROTECTIVE EQUIPMENT:
PLASTIC PROOF CHEMICAL SAFETY GOGGLES. PROTECTIVE IMPERVIOUS GLOVES.

CONCENTRATION IN AIR DETERMINES PROTECTION REQUIRED. NIOSH APPROVAL REQUIRED ON ANY RESPIRATORY EQUIPMENT USED.

ALIPHATIC PETROLEUM DISTILLATES:
EXTINGUISHING MEDIA:
REGULAR FOAM OR CARBON DIOXIDE OR DRY CHEMICAL.

FIREFIGHTING PROCEDURES:
WEAR SELF-CONTAINED BREATHING APPARATUS WITH A FULL FACEPIECE OPERATED IN PRESSURE-DEMAND OR OTHER POSITIVE PRESSURE MODE WHEN FIGHTING FIRES.

SPECIAL FIRE & EXPLOSIVE HAZARDS:

VAPORS ARE HEAVIER THAN AIR AND MAY TRAVEL ALONG THE GROUND OR BE MOVED BY VENTILATION AND IGNITED BY HEAT, PILOT LIGHTS, OTHER FLAMES AND IGNITION SOURCES AT LOCATIONS DISTANT FROM MATERIAL HANDLING POINT.

NEVER USE WELDING OR CUTTING TORCH ON OR NEAR DRUM (EVEN EMPTY) BECAUSE PRODUCT (EVEN JUST RESIDUE CAN IGNITE EXPLOSIVELY.

NAPA CODES: HEALTH -0, FLAMMABILITY -2, REACTIVITY -0.

HEALTH HAZARD DA' :

EYES: CAN CAUSE SERVRE IRRITATION, REDNESS, TEARING, BLURRED VISION.

SKIN:

PROLONGED OR REPEATED CONTACT CAN CAUSE MODERATE IRRITATION, DEFATTING DERMATITIS.

BREATHING:

EXCESSIVE INHALATION OF VAPORS CAN CAUSE NASAL AND RESPIRATORY IRRITATION, DIZZINESS, WEAKNESS, FATIGUE, NAUSEA, HEADACHE, POSSIBLE UNCONSCIOUSNESS, AND EVEN ASPHYXIATION.

SWALLOWING:

CAN CAUSE GASTROINTESTINAL IRRITATION, NAUSEA, VOMITING, AND DIARRHEA. ASPIRATION OF MATERIAL INTO THE LUNGS CAN CAUSE CHEMICAL PNEUMONITIS WHICH CAN BE FATAL.

FIRST AID:

IF ON SKIN: THOROUGHLY WASH EXPOSED AREA WITH SOAP AND WATER. REMOVE CONTAMINATED CLOTHING. LAUNDER CONTAMINATED CLOTHING BEFORE RE-USE.

IF IN EYES: FLUSH WIT LARGE AMOUNTS OF WATER, LIFTING UPPER AND LOWER LIDS OCCASIONALLY, GET MEDICAL ATTENTION.

IF SWALLOWED: DO NOT INDUCE VOMITING, KEEP PERSON WARM, QUIET, AND GET MEDICAL ATTENTION. ASPIRATION OF MATERIAL INTO THE LUNGS DUE TO VOMITING CAN CAUSE CHEMICAL PNEUMONITIS WHICH CAN BE FATAL.

IF BREATHED: IF AFFECTED REMOVE INDIVIDUAL TO FRESH AIR. IF BREATHING IS DIFFICULT, ADMINISTER OXYGEN. IF BREATHING HAS STOPPED GIVE ANTIFICIAL RESPIRATION. KEEP PERSON WARM, QUIET AND GET MEDICAL ATTENTION.

PRIMARY ROUTES OF ENTRY:
INHALATION, SKIN CONTACT.

REACTIVITY DATA:
HAZARDOUS POLYMERIZATION CANNOT OCCUR

STABILITY: STABLE

INCOMPATIBILITY: AVOID CONTACT WITH STRONG OXIDIZING AGENTS.

PAINT PRODUCT CONTAINING- DIMETHYLAMINOETHANOL, N-BUTYL ALCOHOL, BUTYL CARBITOL, BUTYL CELLOSOLVE

HEALTH HAZARD DATA:
THRESHOLD LIMIT VALUE: NOT REQUIRED FOR MIXTURE.

EFFECTS OF OVEREXPOSURE:
IMMEDIATE EFFECTS (ACUTE):
CAN BE ABSORBED THROUGH THE SKIN. HARMFUL IF HANDLES. MAY AFFECT THE BRAIN, NERVOUS SYSTEM OR RESPIRATORY SYSTEM, CAUSING DIZZINESS, HEADACHE, NAUSEA OR RESPIRATORY IRRITATION. OVEREXPOSURE TO INGREDIENTS IN THIS PRODUCT MAY CAUSE NOSE AND THROAT IRRITATION, EYE IRRITATION, EYE BURNS, SKIN IRRITATION, RESPIRATORY TRACT IRRITATION, ASTHMATIC ATTACK AND/OR REACTION, RESPIRATORY-SENSITIZATION.

DELAYED EFFECTS (CHRONIC):
CONTAINS GLYCOL ETHER WHICH HAS BEEN SHOWN TO CAUSE BLOOD EFFECTS DAMAGE IN LABORATORY ANIMALS.

NOTICE: REPORTS HAVE ASSOCIATED REPEATED AND PROLONGED OCCUPATIONAL OVEREXPOSURE TO SOLVENTS WITH PERMANENT BRAIN AND NERVOUS SYSTEM DAMAGE. INTENTIONAL MISUSE BY DELIBERATELY CONCENTRATING AND INHALING THE CONTENTS MAY BE HARMFUL OR FATAL. CONTAINS INGREDIENTS WHICH MAY CAUSE SKIN BURNS, LIVER DAMAGE, KIDNEY DAMAGE, BLOOD DAMAGE, HEARING LOSS.

MEDICAL CONDITIONS GENERALLY AGGRAVATED BY EXPOSURE - ANY RESPIRATORY OR SKIN CONDITION.

EMERGENCY AND FIRST AID PROCEDURES:
EYE CONTACT: FLUSH EYE IMMEDIATELY WITH PLENTY OF WATER FOR AT LEAST 15 MINUTES AND GET MEDICAL ATTENTION.

SKIN CONTACT: WASH THOROUGHLY WITH SOAP AND WATER.

CLOTHING: MOVE CONTAMINATED CLOTHING AND SHOES. WASH CLOTHING BEFORE REUSE. DESTROY CONTAMINATED SHOES.

INHALATION: IF INHALED, REMOVE TO FRESH IR. IF NOT BREATHING, GIVE ARTIFICIAL RESPIRATION. IF BREATHING IS DIFFICULT, GIVE OXYGEN. GET MEDICAL ATTENTION IMMEDIATELY.

SWALLOWING: IF SWALLOWED, GET MEDICAL ATTENTION IMMEDIATELY.

REACTIVITY DATA:
THIS PRODUCT IS STABLE

CONDITIONS TO AVOID: NONE

INCOMPATIBILITY: NA

HAZARDOUS POLYMERIZATION: NONE

SPECIAL PRECAUTIONS:

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORAGE:
KEEP AWAY FROM HEAT, SPARKS AND OPEN FLAMES. KEEP CONTAINER CLOSED NOT IN USE. DO NOT STORE ABOVE 120 DEG F. BASED ON THE PRODUCT FLASH POINT AND VAPOR PRESSURE SUITABLE STORAGE SHOULD BE PROVIDED IN ACCORDANCE WITH OSHA REGULATION 1910.106. EMPTY CONTAINERS MAY CONTAIN PRODUCT RESIDUE, INCLUDING FLAMMABLE OR EXPLOSIVE VAPORS. DO NOT CUT, PUNCTURE OR WELD ON OR NEAR CONTAINER. ALL LABEL WARNINGS MUST BE OBSERVED UNTIL THE CONTAINER HAS BEEN CLEANED OR RECONDITIONED.

HI SOLIDS "C" ENAMEL CONTAINING ALIPHATIC HYDROCARBON, AND AROMATIC HYDROCARBON

UNUSUAL FIRE AND EXPLOSIVE HAZARDS:
KEEP CONTAINERS TIGHTLY CLOSED. AVOID SOURCES OF IGNITION. GROUND ALL TRANSFER EQUIPMENT. CLOSED CONTAINERS MAY EXPLODE WHEN EXPOSED TO EXTREME HEAT.

SPECIAL FIRE FIGHTING PROCEDURES:
WATER SPRAY (FOG NOZZLES) MAY BE USED FOR COOLING CONTAINERS.

HEALTH HAZARD DATA:
THRESHOLD LIMIT VALVE:
276 ppm (WEIGHTED AVERAGE OF SOLVENT MIXTURE)

EFFECTS OF OVEREXPOSURE:
SEVEER EYE IRRITATION. DRYING OF SKIN. EXCESS INHALATION CAUSES HEADACHE, DIZZINESS, NAUSEA.

EMERGENCY AND FIRST AID PROCEDURES:

IN CASE OF SKIN CONTACT, FLUSH WITH PLENTY OF WATER; FOR EYES, IMMEDIATELY FLUSH WITH WATER FOR 15 MINUTES AND GET MEDICAL ATTENTION. IF EXPOSED TO HIGH CONCENTRATION OF VAPOR, REMOVE PATIENTS TO FRESH AIR. IF SWALLOWED, CALL A PHYSICIAN IMMEDIATELY. DO NOT INDUCE VOMITING.

REACTIVITY DATA:

STABILITY: STABLE. HAZARDOUS POLYMERIZATION: WILL NOT OCCUR.

TO: Jim Stern
FROM: Jon Scott
SUBJECT: Waste Water Disposal

Date: July 6, 1995

The ground water (20,000 gallons) from the Underground Storage Tanks was sent to our waste water treatment plant. I authorized Great Lakes Response, Inc. to pump the water to our sewer that flows to our waste water treatment plant.

Sincerely,

Jon Scott
Environmental Engineer

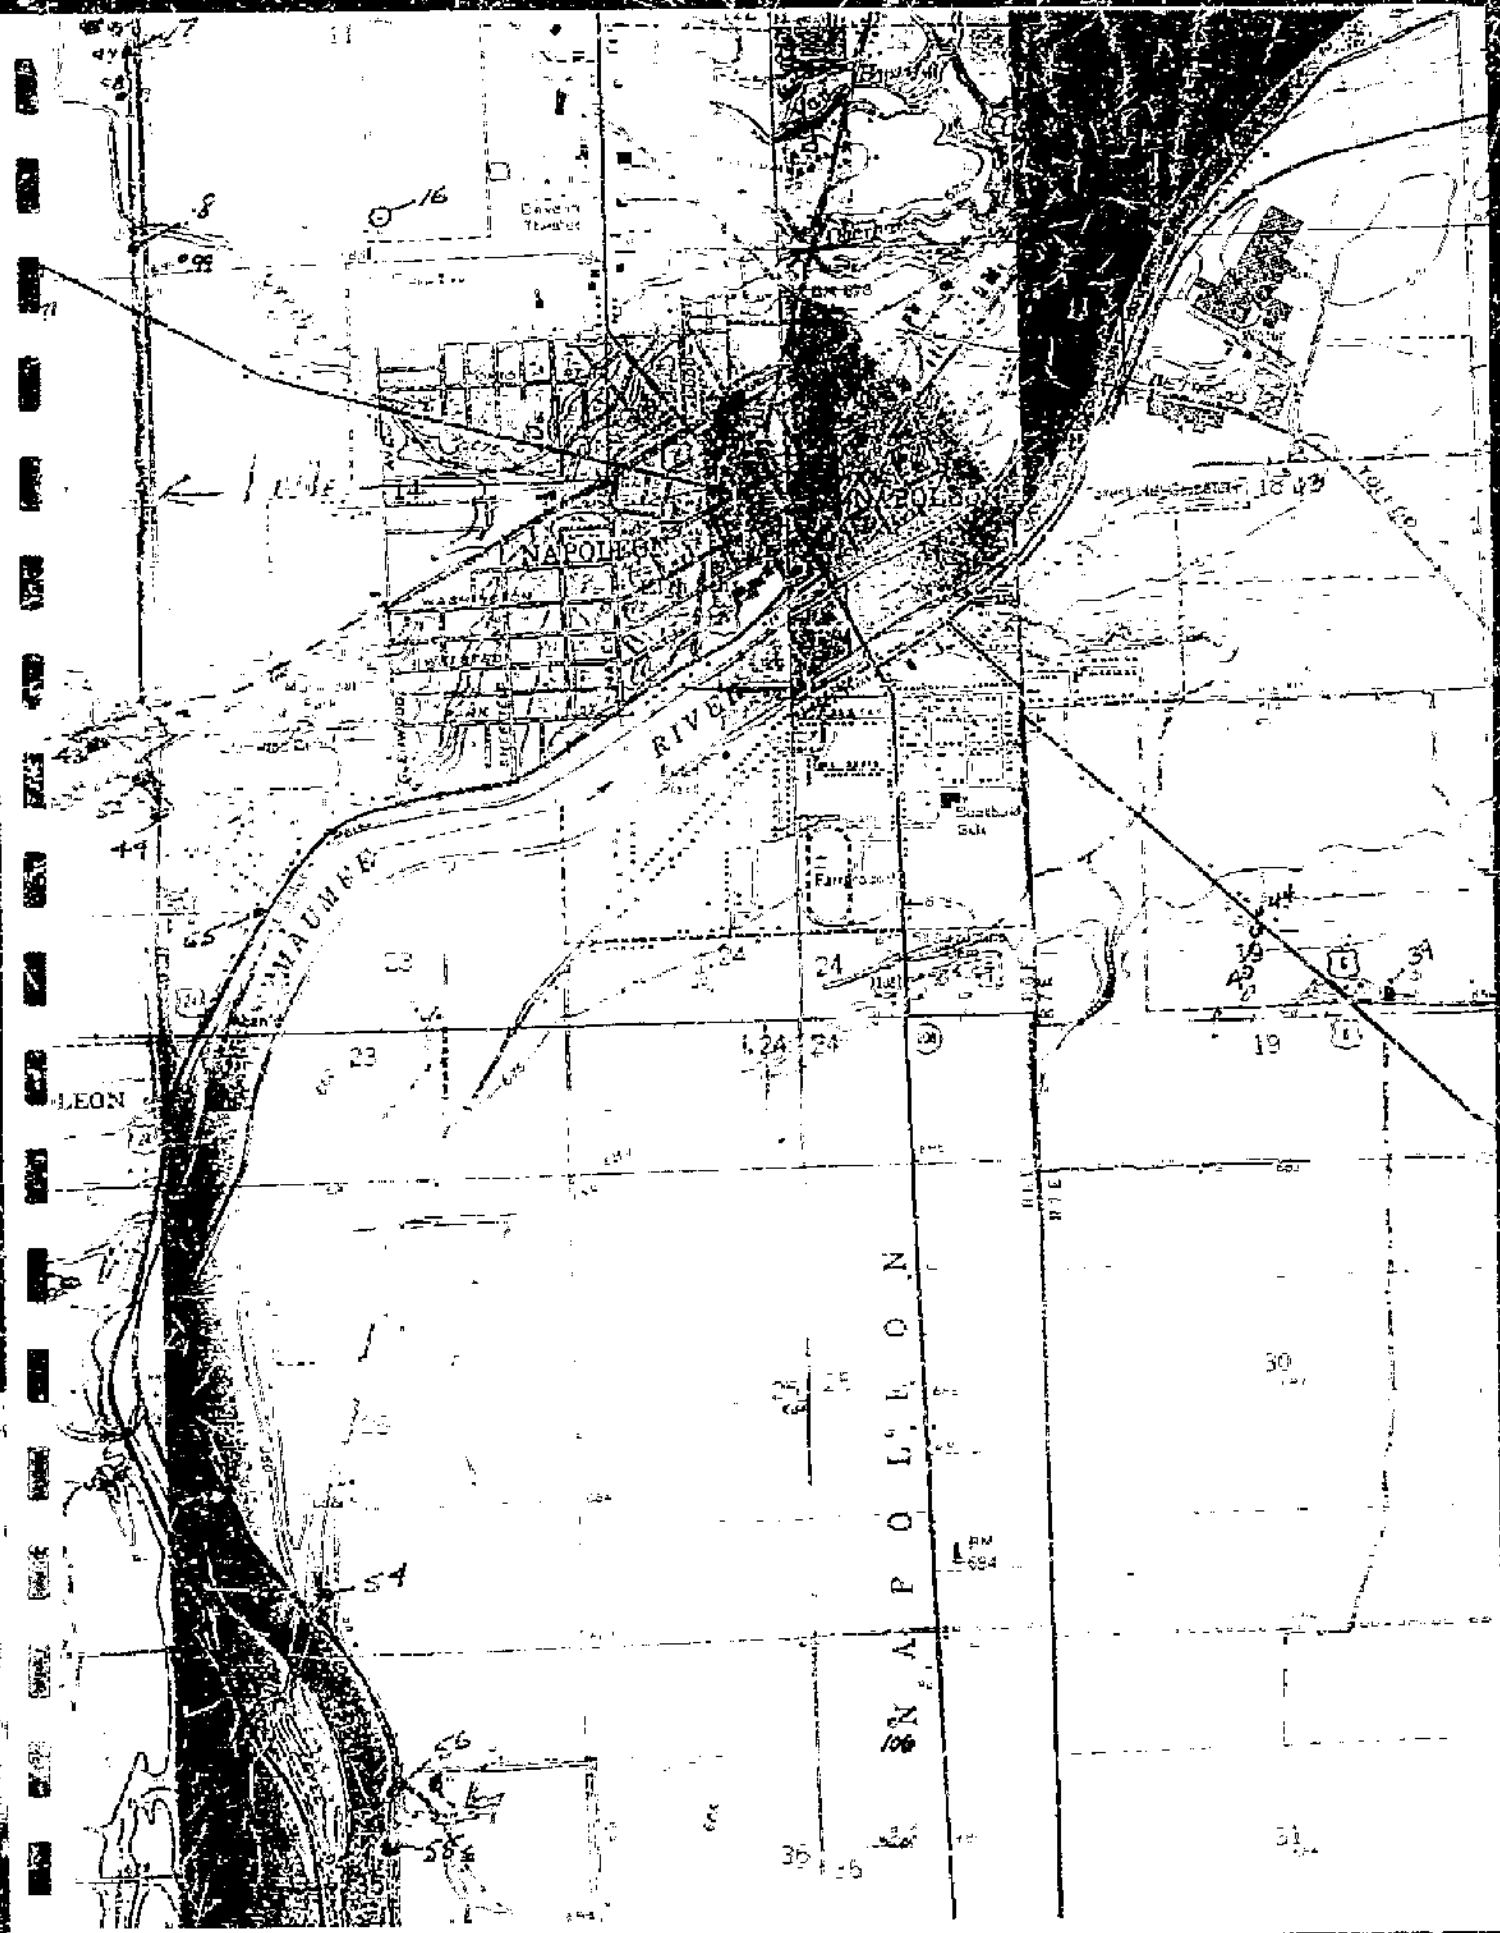
CALIBRATION PROCEDURES FOR BUSTR REQUIRED ANALYTICAL METHODS

8000 Series (solid waste) and 600 Series (water) Methods: Method 8020, Method 8015, Method 602, Method 8100, Method 610, Method 8240, Method 624:

Initial QC procedure is the preparation and injection of a lab blank in order to determine overall system cleanliness before we begin. If contamination is detected in the blank systems are cleaned or replaced until the source of contamination is identified and eliminated. Once the system and all materials are determined clean and functioning properly, the instrument (Gas Chromatograph with either PID, FID, or MS detection system) is calibrated for the specific analytes using a five point calibration method which determines the linear dynamic range of the instrument for those analytes.

Daily calibration checks are performed and must agree within 15% of initial instrument calibration. If daily calibration is outside of this control limit, full recalibration is performed.



A Quality Control check sample is analyzed at least once every 20 samples. The QC check is a solution made up from a separate source of standards from that which is used to calibrate the instrument.

For each day in which analyses are performed, and for every matrix analyzed that day, at least one of each matrix will be spiked with all of the analytes of interest. The spiked samples are then analyzed, recoveries calculated and used in the method calibration.

Method 418.1:

As described above, the system and all materials must be determined free of contamination through laboratory blanks analyses. The calibration is performed through a five point calibration technique, which defines the dynamic range of the instrument.

Each day that the analysis is performed, a calibration check is run to verify agreement with the initial calibration within plus or minus 15%.

Ryne Sundvold,
I was forwarded your request for information regarding the properties on Site 6 and Site 8 on Riverview Avenue in Napoleon, Ohio. The request for Notices of Intent to Fill for these properties were reviewed. We do not have any Notices of Intent to Fill for either of the property addresses listed. However, we do have one Notice of Intent to Fill for 875 Riverview Ave, which is close to this area. You may also wish to contact the Ohio EPA, Northwest District Office to find out if they have any additional records of these two properties.
I have attached the information related to 875 Riverview for your information.
If you have any other questions, please let me know.
Please take just a couple of minutes to complete a short survey regarding your experience with Henry County Health Department's Environmental Health Services. Your answers are anonymous. Click here to take survey<https://www.surveymonkey.com/s/5S5DNVY>.

Mr. Rath

Your 'Notice of Intent to Fill' was received indicating that you are planning on filling an area along the Maumee River across the road from Industrial Drive. The intent is to change the grade of this area. Your fax indicated that the material to be placed in this area would be concrete, brick, asphalt concrete and dirt. Please be aware that according to the Ohio Administrative Code 3745-400-05 clean hard fill is defined as "reinforced or non-reinforced concrete, asphalt concrete, brick, block, tile, and/or stone."

Please note that filling a floodplain with clean hard fill may be regulated by other local and state agencies.

Filling is to begin on Monday, May 23. You must provide a new Notice of Intent to Fill if there are any changes in the information required by the rule for notification.

Notice:

The information contained in this fax transmission is legally privileged, confidential, and protected by law. It is intended only for the use of the addressee. If you receive this communication and are not the intended recipient, you are hereby notified that the copying or distribution of this communication is prohibited. If you have received this communication in error, please immediately notify us by telephone and return the original message to us at the above address.

Attn: Jon Lindsey

Dear Jon:

Please take this as the "Notice of Intent to Fill" at 875 Riverview Dr., Napoleon, Ohio. This property is owned by Todd Rettig and our intend is to change the grade by placing clean hard fill, namely concrete, brick, asphalt concrete and dirt on this site. See attached drawing of what we are proposing to fill.

Per our discussion we would like to have your permission as soon as possible.

Sincerely,

Fort Defiance Construction & Supply, Inc.

Napoleon, Ohio 43545

RE: RCRA CORRECTIVE ACTION, Campbell Soup Supply, Henry County
OHD 005 419 171, Main Plant, 12-773 State Route 110
OHD 987 046 703, V-8 Beverage Plant, 12-995 State Route 110
OHD 987 023 678, Chemical Residue Analytical Lab, P-152 County Road 12

Dear Mr. Koskan:

Ohio EPA and the United States Environmental Protection Agency (U.S. EPA) have reviewed their records and determined that hazardous waste management units were established and operated at the Campbell Soup Supply facilities (Campbell Soup) listed above and located in Napoleon, Ohio making you the owner/operator of a hazardous waste treatment, storage or disposal facility. As such, we are notifying you that the Campbell Soup property and its current owners are subject to the Resource Conservation and Recovery Act (RCRA) Corrective Action requirements under Ohio law. You should already have received a letter dated April 10, 2007 from U.S. EPA Region V to this effect for the 12-773 State Route 110 (OHD 005 419 171) location.

Ohio's RCRA Corrective Action program, which is consistent with and equivalent to the federal Corrective Action program implemented by U.S. EPA, requires the owner/operator of a treatment, storage or disposal facility to be responsible for investigating and, as necessary, cleaning up any hazardous waste or hazardous constituent releases at, or from their facilities, regardless of when they occurred.

The property located at 12-773 State Route 110 operated as an unpermitted hazardous waste storage, treatment and disposal facility from 1981 through 1983, when semi-solid hazardous wastes were dumped into the Former Holding Pit Area, allowed to dry and eventually were mixed with sand prior to disposal at a landfill. Prior to January 1993, Campbell's ignitable wastes were poured onto a waste coal pile located on the grounds of the Main Plant and later burned in a boiler for energy recovery. Storage, treatment

and disposal of hazardous wastes were conducted without a permit, thereby subjecting you to the permitting and closure requirements found in Ohio Administrative Code (OAC) Chapters 3745-50, 54 and 55. These activities are why the entire property is subject to the RCRA Corrective Action requirements found in OAC rule 3745-54-101. Closure of the Former Holding Pit Area was conducted in accordance with an approved closure plan and was certified closed on June 11, 2004. Soil sampling of the waste pile area determined that Campbell's activities did not result in any elevated levels of solvents in soil beneath the waste pile.

This notification does not imply failure on your part to meet any obligation, nor should it be construed as an adverse action against you. It only means Ohio EPA and U.S. EPA have identified your facility- and every other facility in the 2020 universe- as needing to complete RCRA corrective action if you have not done so already. U.S. EPA's national program goal is to largely address these cleanup obligations before the end of 2020. Accordingly, progress will be tracked for each facility in the 2020 universe. The list of facilities is posted on U.S. EPA's web site at http://www.epa.gov/correctiveaction.

Ohio EPA considers it mutually beneficial to meet with you or your facility's environmental representative to discuss your RCRA Corrective Action obligations and the options available to address them. I will contact you within the next 30 days to arrange a meeting at your facility. Any relevant information including, but not limited to, waste management activities, spills, releases, investigations including Phase I and Phase II reports, sampling or remediation activities conducted at the facility that you can provide for this meeting may be helpful to our discussions.

While you should be expecting my call within 30 days, please feel free to contact me at (419) 373-3148, if you have any questions.

Sincerely,

Dawn Pleiman

Campbell Soup Supply Co.
12-995 State Route 110, Napoleon, Ohio, V-8 Beverage Plant, Henry County
OHD 987 046 703
Corrective Action Summary Notes

Site History

Campbell's Beverage Plant produces heat-processed food products including several types of vegetable juices (ex. Splash and V-8). Very little hazardous waste is generated at the plant because most of the materials used in the plant must be food grade materials. The Beverage Plant used to be a SQG and a burner of waste oil. Now the plant is just a CESQG-TSD. The facility generates video ink jet waste (D001, F005), waste paint (D001) and non-hazardous used oil. The waste codes listed for the V-8 Plant are D001, D002, D009 and F005.

An April 26, 1994 NOV letter cited the Beverage Plant and Lab with 3734.02(E)&(F) violations for storing and treating ignitable hazardous wastes in a waste pile prior to burning in an on-site boiler without a hazardous waste installation and operation permit. Up until January 1993, Campbell's ignitable wastes were poured onto a coal pile (located on Campbell's Main Plant property) and later burned in a boiler for energy recovery. Campbell prepared a sampling and analysis plan (SAP) for the soil beneath the coal pile and determined that disposal of the waste solvent did not impact the soil. Therefore the violation was considered abated in a December 12, 1994 letter from Ohio EPA.

A November 2003 CEI found a violation for failing to determine that its video ink jet waste (D001) was also F005 hazardous due to the cleaner containing 68% MEK. Another violation was cited for failing to check or record emergency equipment testing.

Reason Subject to Corrective Action

Corrective Action obligations are linked to the facility due to storage and treatment of the ignitable hazardous wastes in a waste pile prior to burning in an on-site boiler without a permit. The May 16, 2000 NOV letter (that is in the Main Plant file) lists all 3 Campbell's plants.

Campbell Soup Supply Co.
P-152 County Road 12, Napoleon, Ohio, Chemical Residue Analytical Lab, Henry County
OHD 987 023 678
Corrective Action Summary Notes

Site History

The only information that was found on file is a Notification of Regulated Waste Activity form. The document was submitted to show that a new installation contact was listed. The April 5, 1994 CEI was for the Beverage Plant and the Chemical Residue Analytical Lab. Violations as a result of the CEI were listed for both facilities.

A 1994 CEI cited two violations: pre-transport requirements (emergency equipment testing) and closure/post-closure (operation of a coal waste pile for storage/treatment). The violation for the emergency equipment testing was abated on 6/29/94. Campbell's demonstrated that the application of waste solvent onto the coal pile did not impact the underlying soil beneath the coal pile so the violation was considered abated on 12/12/94.

RCRA Info lists the following waste codes: D001, F002, F003

Reason Subject to Corrective Action

Corrective Action obligations are linked to the facility due to storage and treatment of the ignitable hazardous wastes in a waste pile prior to burning in an on-site boiler without a permit. The inspection that cited this violation did not indicate where the waste solvent was generated. There is the possibility that the waste solvents came from only the Beverage Plant and not the Lab. However, the May 16, 2000 NOV letter (that is in the Main Plant file) lists all 3 Campbell's plants.

Re: PCB Compliance Inspection
Date: November 19, 1997

Dear Sir:

A representative of the United States Environmental Protection Agency (U.S. EPA) conducted a PCB compliance inspection at the above referenced facility on the above date.

Based upon the data collected during the inspection, the U.S. EPA has determined that no violations of the Federal PCB regulations, 40 C.F.R., Part 761, were evident at the time of the inspection.

Please be advised that your Square D transformer, s/n 796006822, is assumed to PCB-contaminated. When this unit is removed from service it must be tested to determine the proper method of disposal.

If you have any questions, please do not hesitate to call this office at 312-886-6937.

Sincerely,

Anthony L. Restaino, Chief

V. COMPANY BACKGROUND [X] PCBs [ ] No PCBs discovered

Parent company:

Campbell's Fresh Inc. is a wholly owned subsidiary of the Campbell Soup Company. The Campbell Soup Company is headquartered at Campbell Place, Camden, New Jersey, 08103-1799. The CEO of Campbell Soup is Dale Morrison.

The facility began as the first mushroom farm for Campbell's Soup. The farms were considered part of the closest soup plant. The present facility was built at this location in 1980 as the CAMSCO Mushroom Company. The spawn operation did not become part of the company until 1982 when the company became CAMSCO Produce Company. The company became known as Campbell's Fresh Inc. in 1990. The land that the facility is on belongs to the Campbell Soup Company. The facility belongs to Campbell's Fresh Inc. There are approximately 18,00 square feet under roof. The facility has 22 full time employees.

The facility produces mushroom spawn, which is the vegetative state of the fungi from which mushrooms grow. The facility grows the mycelium on a hydrated grain culture medium. This innoculated culture is allowed to incubate approximately two weeks at which time it is harvested and bagged. The bagged culture medium is then allowed to grow for two weeks at 35 degrees F before it is shipped. The facility sells the innoculum to Campbell's Fresh Inc. mushroom

farms as well as other independent farms. The innoculum is used to seed compost on which the mushrooms are grown. Campbell's Fresh Inc. grows approximately 100 million pounds of mushrooms a year.

Basis for selection:

Neutral Inspection Scheme.

VI. INSPECTION SUMMARY

A. Opening Conference

The inspector(s) met with company officials as indicated in Section II, presented TSCA Inspection Credentials, explained the purpose of the inspection, and presented for signature the TSCA inspection Forms as indicated below:

[X] Notice of Inspection
[X] TSCA Confidentiality Notice
[ ] Receipt for samples/Documents collected

These documents are enclosed as Attachment A and were signed by the Responsible Official referenced above.

B. Circumstances Applicable to this Inspection

[ ] Manufacturing	**[ ] Distribution**
[ ] Processing	**[X] Use/Authorizations**
[ ] Marking	**[ ] Disposal**
[ ] Storage	**[ ] Recordkeeping**
[ ] None of the Above	

C. CITATION

[X] Not Applicable
[ ] Citation Issued on:
[ ] Response received on:

D. CLOSING CONFERENCE

[X] The inspector(s) explained the three possible outcomes of the inspection and informed the company officials that a final determination and notification would be made by the USEPA Region 5 Office.

VII. SAMPLES/ PHOTOGRAPHS/ DOCUMENTS

[ ] Other	

A. Manufacturing (761.20)
The facility is not a manufacturer of PCBs.

B Distribution (761.20)
The facility is not a distributor of PCBs.

C. Processing (761.20)
The facility is not a processor of PCBs.

D. Use/Authorizations (761.30)

1. Electrical Equipment

a. Transformers
The facility owns two oil filled, PCB containing transformers. One transformer was new when the facility was built in 1980. This is a Square D, 12470 volt, 135 gallon, 150 KVA transformer s/n 796006822. The other transformer was purchased new in 1994. Both transformers are located outside the building on a pad. Both transformers are inside metal enclosures.

b. Capacitors
The facility does not own any PCB capacitors

c. Other Electrical Equipment
The facility does not own any other PCB containing electrical equipment.

2. Hydraulic Equipment
The facility does not own any PCB containing hydraulic equipment.

3. Heat transfer Equipment
The facility does not own any PCB containing heat transfer equipment.

E. Marking (761.40)
NA

F. Disposal (761.60)
The facility has never disposed of any PCB equipment.

G. Storage (761.65)

REASON FOR INSPECTION

Under the authority of Section 11 of the Toxic Substances Control Act:

☑ For the purpose of inspecting (including taking samples, photographs, statements, and other inspection activities) an establishment, facility, or other premises in which chemical substances or mixtures or articles containing same are manufactured, processed or stored, or held before or after their distribution in commerce (including records, files, papers, processes, controls, and facilities) and any conveyance being used to transport chemical substances, mixtures, or articles containing same in connection with their distribution in commerce (including records, files, papers, processes, controls, and facilities) bearing on whether the requirements of the Act applicable to the chemical substances, mixtures, or articles within or associated with such premises or conveyance have been complied with.

☐ In addition, this inspection extends to *(Check appropriate blocks):*

- ☐ A. Financial data
- ☐ B. Sales data
- ☐ C. Pricing data
- ☐ D. Personnel data
- ☐ E. Research data

The nature and extent of inspection of such data specified in A through E above is as follows:

TO ASSERT A CONFIDENTIAL BUSINESS INFORMATION CLAIM

It is possible that EPA will receive public requests for release of the information obtained during inspection of the facility above. Such requests will be handled by EPA in accordance with provisions of the Freedom of Information Act (FOIA), 5 USC 552; EPA regulations issued thereunder, 40 CFR Part 2; and the Toxic Substances Control Act (TSCA), Section 14. EPA is required to make inspection data available in response to FOIA requests unless the Administrator of the Agency determines that the data contain information entitled to confidential treatment or may be withheld from release under other exceptions of FOIA.

Any or all the information collected by EPA during the inspection may be claimed confidential if it relates to trade secrets or commercial or financial matters that you consider to be confidential business information. If you assert a CBI claim, EPA will disclose the information only to the extent, and by means of the procedures set forth in the regulations (cited above) governing EPA's treatment of confidential business information. Among other things, the regulations require that EPA notify you in advance of publicly disclosing any information you have claimed as confidential business information.

A confidential business information (CBI) claim may be asserted at any time. You may assert a CBI claim prior to, during, or after the information is collected. The declaration form was developed by the Agency to assist you in asserting a CBI claim. If it is more convenient for you to assert a CBI claim on your own stationery or by marking the individual documents or samples "TCSA confidential business information," it is not necessary for you to use this form. The inspector will be glad to answer any questions you may have regarding the Agency's CBI procedures.

While you may claim any collected information or sample as confidential business information, such claims are unlikely to be upheld if they are challenged unless the information meets the following criteria:

1. Your company has taken measures to protect the confidentiality of the information, and it intends to continue to take such measures.
2. The information is not, and has not been, reasonably obtainable without your company's consent by other persons (other than governmental bodies) by use of legitimate means (other than discovery based on showing of special need in a judicial or quasi-judicial proceeding).
3. The information is not publicly available elsewhere.
4. Disclosure of the information would cause substantial harm to your company's competitive position.

At the completion of the inspection, you will be given a receipt for all documents, samples, and other materials collected. At that time, you may make claims that some or all of the information is confidential business information.

If you are not authorized by your company to assert a CBI claim, this notice will be sent by certified mail, along with the receipt for documents, samples, and other materials to the Chief Executive Officer of your firm within 2 days of this date. The Chief Executive Officer must return a statement specifying any information which should receive confidential treatment.

The statement from the Chief Executive Officer should be addressed to:

TSCA Document Control Officer
U.S. EPA Region V DRT-8J
77 West Jackson Boulevard
Chicago, Illinois 60604

and mailed by registered, return-receipt requested mail within 7 calendar days of receipt of the Notice. Claims may be made any time after the inspection, but inspection data will not be entered into the special security system for TSCA confidential business information until an official confidentiality claim is made. The data will be handled under the agency's routine security system unless and until a claim is made.

TO BE COMPLETED BY FACILITY OFFICIAL RECEIVING THIS NOTICE:	If there is no one on the premises of the facility who is authorized to make business confidentiality claims for the firm, a copy of this Notice and other inspection materials will be sent to the company's chief executive officer. If there is another company official who should also receive this information, please designate below.
I have received and read the notice.	

Certification

I certify that the statements I have made on this form and all attachments thereto are true, accurate, and complete. I acknowledge that any knowingly false or misleading statement may be punishable by fine or imprisonment or both under applicable law.

Re: Boiler and Industrial Furnace
Small Quantity Burner Exemption
OHD 005 419 171

Dear Mr. Oldach:

The United States Environmental Protection Agency (U.S. EPA) is in receipt of your October 26, 1994, letter. Your letter requests that the Napoleon Campbell Soup Company facility be removed from U.S. EPA's list of hazardous waste burners under the Boiler and Industrial Furnace (BIF) small quantity burner exemption. U.S. EPA does not maintain such a list. Facilities operating under the BIF small quantity burner exemption are required pursuant to 40 CFR 266.108(d) to notify U.S. EPA of eligibility for the exemption. Campbell Soup Company did submit such a notification and this notification shall be retained in U.S. EPA files. In addition to retaining the notification, U.S. EPA will retain your October 26, 1994, letter stating that Campbell Soup Company will no longer be operating as a small quantity burner.

Should you have any questions feel free to contact Julianne Socha, of my staff, at 312/886-4436.

Sincerely yours,

Joseph M. Boyle

Re: Campbell Soup Company
OHD 005 419 171

Dear Mr. Salsbury:

The United States Environmental Protection Agency (U.S. EPA) is in receipt of your August 26, 1993, submission in response to the Notice of Violation issued on August 2, 1993, by U.S. EPA regarding violations of 40 CFR Part 266 Subpart H. U.S. EPA has reviewed your submission and determined that Campbell Soup Company has returned to compliance with respect to the requirements found at 40 CFR 266.108(d)(3) and (e).

Should you have any questions feel free to contact Julianne Socha at (312) 886-4436.

Sincerely yours,

Re: **Notice of Violation**
Campbell Soup Company
OHD 005 419 171

Dear Ms. Socha:

Within the thirty (30) day time frame for response to the NOV, we are herewith providing you with the requested information. This is shown in the attached. Exhibit "A" is the revised Notification for the combustion of the spent solvent as a fuel supplement. Exhibit "B" is the detailed explanation of the terrain-adjusted effective stack height (TESH). Exhibit "C" is the heating value analysis of the spent solvent used as a fuel supplement.

We would like to bring to your attention the following facts. At the time of the original Notification of 8 August, 1991 the practice was to spread the spent solvent onto the adjacent coal pile. This was then burned in conjunction with coal as the fuel supplement. The quantity burned was approximately seven (7) gallons per day (140 gallons/20 days) with approximately 100 tons of coal. Therefore, the maximum fuel supplement firing rate was: seven (7) gallons/day times eight (8) lbs/gallon times 19,703 Btu/lb = 1,103,368 Btu. In contrast to coal of 2.6 X 10^{6}BTU, or 0.04% of the gross heat input.

The TESH used originally, although not strictly according to 40 CFR 266.108 (a)(1), by using just the physical height provides for a very conservative quantity of spent solvent as a fuel supplement. Exhibit "B" shows actually by the USEPA procedures, a greater quantity is allowed under 266.108(a)(1).

The practice of placing the spent solvents on the coal pile was discontinued in January of 1993. The spent solvents are now placed into a receiving tank at the boiler plant and used as a fuel supplement in the oil fired #3 boiler. This allows the boiler operator the ability to control the firing rates of the spent solvent as a fuel supplement. Also, we would like to emphasize that a plant initiated intensive waste minimization program, since January, has been implemented. This has appreciably reduced the quantity of spent solvent used as a fuel supplement. We will however, maintain the capability of using spent solvents as a fuel supplement.

Exhibit "B" reflects the physical conditions of boiler #3 stack in calculating the TESH. The physical terrain features for the 5 kilometer radius is from the attached USGS 7.5 minute quadrangle.

RECEIVED
SEP 1 1
DIV.

The pumping rate of the spent solvent is 3.9 gallons per hour. With a heating value of 19,703 Btu/lb, the hourly gross heat input is 507,155 Btu/hr. The ratio of spent solvent to fuel oil is 0.5% to 0.8%, based on steam load. This is well within the 1% exemption criteria of 266.108(a)(2).

We appreciate this opportunity to set the record straight. Should you have any questions in this regard, please feel free to contact me at 419-592-1010 extension 6601.

Sincerely,

CAMPBELL SOUP COMPANY

RE: **Regulation of the Burning of Hazardous Waste in Boilers and Industrial Furnaces**

Dear Mr. Boyle:

As requested in your NOV notice to us dated August 2, 1993, this letter is our revised notification pursuant to 40 CFR 266.108(d).

1. Campbell Soup Company #3 boiler will operate as a small quantity burner of hazardous waste.

2. The boiler will be operated in compliance with the requirements of section 40 CFR 266.108:

   (a) The maximum hazardous waste burned will not exceed at any time one (1) percent of total fuel requirements.

   (b) The hazardous waste will have a minimum heating value of 5,000 BTU/Lb.

   (c) The hazardous waste will not contain E.P.A. Hazardous Waste No's F020, F021, F022, F023, F026 or F027.

3. The quantity of hazardous waste burned will not exceed the limits as defined in 266.106(b)(3). The TESH of our boiler is 56.4 meters which provides a maximum quantity of 400 gallons per month of hazardous waste that may be burned.

Sincerely,

CAMPBELL SOUP COMPANY

L. M. Brown
Plant Manager

LMB/cag

cc: Michael Savage, OEPA-Columbus
Herbert H. Salsbury

Exhibit "B"

Calculation of the TESH for #3 boiler.

Determination of GEP from 40 CFR 15.100(hh)(2)(v)(ii) the GEP is defined as:

(1) 65 meters, measured from the ground-level elevation of the base of the stack,

or

(2)(i) for stacks in existence on January 12, 1979, $H_g = 2.5\ H$

2)(ii) for all other stacks, $H_g = H + 1.5\ L$; where L = 64 meters for the next highest structure.

For this stack, the height is 30.8 meters. This height was chosen due to the height of the adjacent water treatment building which has a ground elevation of 6.2 meters higher than the grade elevation at the boiler house, with a building height of 24 meters. The overall effective height of the building relative to the boiler stack is 30.2 meters.

Stack gas conditions:
Temperature = 513°F or 540°K
Gas flow rate = 54,000 acfm or 25.38 m^3/sec.

$TESH = H_a + H_1 - T_r$

where H_a = 30.8 meters
H_1 = 29 meters from Appendix VI
T_r = 3.4 meters from USGS map

$TESH = 30.8 + 29 - 3.4$
$= 56.4$ meters

From 266.108(a)(1) the Exempt Quantities for Small Quantity Burner Exemption for a TESH of 56.4 meters; 400 gallons per month.

Napoleon BIF Compliance

Conversion factors to determine the terrain-adjusted effective stack height.

Temperature: Convert °F to °K = (5/9) ($T_{°F}$ + 459.68)

Gas Flow rate: Convert acfm to M^3/sec = (ft^3/min) (min/60 sec) (0.02832 M^3/ft^3)

Tr: This is a terrain adjustment factor, for height within 5 kilometers (three miles) of stack and takes into account the nature of land use within this range.

The typical land use within this range is rual. The typical elevation differential within this range is less than 4 meters.

TESH = Ha + H_1 - Tr
Where Ha is physical height in meters.
H_1 is the plume rise from Appendix V1

Re: Notice of Violation
Campbell Soup Company
OHD 005 419 171

Dear Mr. Salsbury:

On May 19, 1993, the United States Environmental Protection Agency (U.S. EPA), Region V performed a Boiler and Industrial Furnace (BIF) compliance evaluation inspection at the Campbell Soup Company (Campbell) located 1/4 mile off Route 110 in Napoleon, Ohio. The purpose of this inspection was to evaluate Campbell's compliance with the requirements of 40 CFR Part 266 Subpart H. Upon review of the inspection findings and information contained in U.S. EPA files Campbell has been determined to be in violation of the following requirements of 40 CFR Part 266 Subpart H.

- Campbell failed to provide a notification pursuant to 40 CFR §266.108(d) which provides the maximum quantity of hazardous waste that the facility may burn per month as provided by 40 CFR §266.108(a)(1). Rather than providing the maximum quantity of hazardous waste, which is a function of terrain-adjusted effective stack height, Campbell provided a quantity of hazardous waste as a function of physical stack height. This is a violation of 40 CFR §266.108(d)(3).

- Campbell failed to have sufficient records documenting compliance with the minimum heating value limit of 5000 Btu/lb, as generated, for hazardous waste. This is a violation of 40 CFR §266.108(e).

Within thirty (30) days of receipt of this Notice of Violation Campbell shall submit the following information in order to demonstrate compliance with 40 CFR §§266.108(d)(3) and 266.108(e).

- A revised notification pursuant to 40 CFR §266.108(d) which provides the maximum quantity of hazardous waste that the facility may burn per month as provided by 40 CFR §266.108(a)(1).

Printed on Recycled Paper

- An explanation of how the terrain-adjusted effective stack height, in meters, was calculated.

- Analysis providing the heating value (Btu/lb) of the hazardous waste, as generated, which is burned in the BIF.

The above information shall be submitted to the United States Environmental Protection Agency, Region V, RCRA Enforcement Branch, Attention: Julianne Socha, 77 W. Jackson Boulevard (HRE-8J), Chicago, Illinois 60604.

In addition to the violations discussed above the May 19, 1993, inspection results indicate that Campbell was placing spent solvents on an outside coal pile. This practice of placement of spent solvents to the coal pile is unacceptable. Information collected during the May 19, 1993, inspection regarding the spent solvents has been referred to the Ohio Environmental Protection Agency for further investigation.

If you have any questions regarding this Notice of Violation feel free to contact Julianne Socha at (312) 886-4436.

Sincerely yours,

Paul E. Dennis

for Joseph M. Boyle, Chief
RCRA Enforcement Branch

Date: June 20, 1993

Subject: Final BIF Inspection Report
Campbell Soup Company, Napoleon, Ohio

From: Jae B. Lee
Hazardous Waste combustion Inspector, Region V

To: File

Inspection Date : May 19, 1993

Inspection Participants:	Jae B. Lee	(U.S. EPA)
	Herbert H. Salsbury	(Campbell soup Co.)

Facility : Campbell Soup Company
1/4 Mile off Route 110
Napoleon, Ohio 43545

OHD 005 419 171
(419) 592-1010

Responsible Official of Campbell Soup Co.:

Herbert H. Salsbury: Manager, Services & Utilities

Applicable Regulations:

40 C.F.R. Parts 266.108 : Small Quantity Burner Exemptions

Purpose of Inspection:

This inspection is a routine Compliance Evaluation Inspection of Campbell Soup Company, Napoleon, Ohio, pursuant to Section 3007 of RCRA, for the evaluation of Campbell's compliance with the requirements of RCRA and the newly promulgated regulations concerning the burning of hazardous waste and other related activities of Boilers and Industrial Furnaces (BIFs) published in 40 C.F.R. Part 266 Subpart H.

(I) Facility Description

Campbell Soup Company (Campbell) generates spent solvent liquid waste (mostly "O" thinner) as a result of its maintenance activities. This waste material was burned in the two coal-fired boilers with one common stack at Campbell facility to produce steam. Waste solvent collected from the various parts maintenance locations were brought to the coal pile in the 50-gallons can. Campbell indicated that there are 22 parts maintenance locations in the facility and each maintenance location generates approximately up to 50 gallons of waste solvent. The collected waste solvent was manually spread (walking through at the top of coal pile) at the top of coal pile located in the yard. It was not known how well the waste solvent was mixed with coal pile (i.e., the degree of uniform mixing with total mass of coal). Based on the operating log, up to 140 gallons per month of waste solvent was generated and spread over the coal pile. However, it was not known whether all of these 140 gallons of waste were generated at one time or at different time within the month. Campbell has indicated that there were usually 3,000 Tons of coal in the yard. Approximately 100 Tons of coals were used to be burned in the boilers daily and 100 Tons of coals were brought into the coal pile daily. According to the Campbell's historical operating log, approximately 20 to 140 gallons per month of liquid hazardous waste were burned from September 1991 to January 1993. Due to the internal waste recycling program, no waste has been generated since January of 1993 (the exact date was not known). Since waste solvent was carried to the coal pile as it generated, no waste solvent was stored at the facility.

There was no monitored or recorded firing rate of hazardous waste available at the facility. Therefore, the determination whether the maximum hazardous waste firing rate have exceeded at any time 1 percent of the total fuel requirements could not be made. Based on the worst possible scenario, it can be assumed that the maximum hazardous waste (140 gallons) was generated at the same time and spread over only portion of daily usage coal pile (around 100 Tons of coal). Based on the 8.0 Ib/gallon waste density, the 1 percent firing rate of hazardous waste would be 253 gallons (based on the above worst possible scenario). If the waste solvent was spread over very small amount of coal, then it is possible that the firing rate of hazardous waste might have exceeded the 1 percent criteria. Since the heating values of coal (around 13,000 Btu/Ib) and waste solvent (17,000 Btu/Ib) were similar, it is expected that the maximum hazardous waste firing rate would not exceed 1 percent of the total fuel requirements on a total heat input. The Material Safety Data Sheet indicates that "O" thinner has heating value as 17,300 Btu/Ib.

Campbell has indicated that used oil generated at the facility was burned in the boiler #3 (oil-fired boiler). In October 1991, Campbell has analyzed used oil to determine whether used oil can be managed as non-hazardous waste. Due to the lower flash point, used oil was considered as hazardous waste and spread over coal pile. Campbell indicated that used oil was analyzed again and showed higher flash point than 140 F. Since then, according to the Campbell, used oil has been burned in the boiler #3. The second analysis of used oil was not reviewed.

On August 19, 1991, Campbell submitted the Small Quantity Burner (SQB) Notification to U.S. EPA. The physical stack height was estimated as 30 meters and the maximum quantity of hazardous waste to be burned was determined as 140 gallons per month (from §266.108 (a)(1)).

(II) Inspection Findings and Observed Violations

On May 19, 1993, U.S. EPA performed a BIF Compliance Inspection at Campbell to determine Campbell's compliance with the limits and conditions specified in the SQB Exemption and other requirements of the BIF regulations.

During the inspection, the following potential problems were observed:

(a) Inadequate SQB Notification

40 CFR 266.108 (a)(1) : The quantity of hazardous waste burned in a device for a calendar month does not exceed the limits provided in the following table based on the terrain-adjusted effective stack height as defined in section 266.106(b)(3) :

In the Notification submitted on August 19, 1991, Campbell has failed to determine the terrain-adjusted effective stack height. Campbell has used the physical stack height of 30 meters, and the maximum hazardous waste to be burned in the boilers was determined as 140 gallons per month based on the physical stack height. (See Attachment 1)

During the inspection, Campbell has provided that the exit gas flow rate is 44,000 ACFM (21 CMS) and exit gas temperature is 465 F (513 K). (The plume rise determined from Appendix VI is 27 meters.) Since this facility is located in the generally flat area (based on the visual observation), it is not expected to have higher terrain rise within 5 kilometers of the facility in order to result in the significant reduction of terrain-adjusted

effective stack height. (There was no information available at the facility about the terrain rise within 5 kilometers of the facility.) If necessary, information request can be made to Campbell for topography map within 5 kilometers of the facility. Such information can be used to determine the allowable maximum hazardous waste burning rate and any potential exceedences.

Ms. Pam Allen
Division of Hazardous Waste Management
Central Office
Ohio Environmental Protection Agency
P.O. Box 1049
1800 WaterMark Drive
Columbus, Ohio 43266-1049

Dear Ms. Allen:

Enclosed please find a copy of a June 20, 1993, Boiler and Industrial Furnace (BIF) Inspection Report for Campbell Soup Company (Campbell Soup), Napoleon, Ohio, EPA I.D. No. OHD 005 419 171. During the BIF inspection conducted by the United States Environmental Protection Agency on May 19, 1993, it was discovered that Campbell Soup was placing spent solvents on an outside coal pile prior to burning the spent solvents and coal in a boiler.

This inspection report is being transmitted to the Ohio Environmental Protection Agency (OEPA) in order for OEPA to evaluate the compliance of Campbell Soup with applicable provisions of the Ohio Administrative Code rules for treatment, storage, and disposal facilities along with applicable Land Disposal Restrictions. Thank you for your attention to this matter.

Sincerely yours,

Kevin M. Pierard, Chief
MN/OH Technical Enforcement Section

Enclosure

Responsible Official of Campbell Soup Co.:

Herbert H. Salsbury: Manager, Services & Utilities

Applicable Regulations:

40 C.F.R. Parts 266.108 : Small Quantity Burner Exemptions

Purpose of Inspection:

This inspection is a routine Compliance Evaluation Inspection of Campbell Soup Company, Napoleon, Ohio, pursuant to Section 3007 of RCRA, for the evaluation of Campbell's compliance with the requirements of RCRA and the newly promulgated regulations concerning the burning of hazardous waste and other related activities of Boilers and Industrial Furnaces (BIFs) published in 40 C.F.R. Part 266 Subpart H.

(I) Facility Description

Campbell Soup Company (Campbell) generates spent solvent liquid waste (mostly "O" thinner) as a result of its maintenance activities. This waste material was burned in the two coal-fired boilers with one common stack at Campbell facility to produce steam. Waste solvent collected from the various parts maintenance locations were brought to the coal pile in the 50-gallons can. Campbell indicated that there are 22 parts maintenance locations in the facility and each maintenance location generates approximately up to 50 gallons of waste solvent. The collected waste solvent was manually spread (walking through at the top of coal pile) at the top of coal pile located in the yard. It was not known how well the waste solvent was mixed with coal pile (i.e., the degree of uniform mixing with total mass of coal). Based on the operating log, up to 140 gallons per month of waste solvent was generated and spread over the coal pile. However, it was not known whether all of these 140 gallons of waste were generated at one time or at different time within the month. Campbell has indicated that there were usually 3,000 Tons of coal in the yard. Approximately 100 Tons of coals were used to be burned in the boilers daily and 100 Tons of coals were brought into the coal pile daily. According to the Campbell's historical operating log, approximately 20 to 140 gallons per month of liquid hazardous waste were burned from September 1991 to January 1993. Due to the internal waste recycling program, no waste has been generated since January of 1993 (the exact date was not known). Since waste solvent was carried to the coal pile as it generated, no waste solvent was stored at the facility.

There was no monitored or recorded firing rate of hazardous waste available at the facility. Therefore, the determination whether the maximum hazardous waste firing rate have exceeded at any time 1 percent of the total fuel requirements could not be made. Based on the worst possible scenario, it can be assumed that the maximum hazardous waste (140 gallons) was generated at the same time and spread over only portion of daily usage coal pile (around 100 Tons of coal). Based on the 8.0 Ib/gallon waste density, the 1 percent firing rate of hazardous waste would be 253 gallons (based on the above worst possible scenario). If the waste solvent was spread over very small amount of coal, then it is possible that the firing rate of hazardous waste might have exceeded the 1 percent criteria. Since the heating values of coal (around 13,000 Btu/Ib) and waste solvent (17,000 Btu/Ib) were similar, it is expected that the maximum hazardous waste firing rate would not exceed 1 percent of the total fuel requirements on a total heat input. The Material Safety Data Sheet indicates that "O" thinner has heating value as 17,300 Btu/Ib.

Campbell has indicated that used oil generated at the facility was burned in the boiler #3 (oil-fired boiler). In October 1991, Campbell has analyzed used oil to determine whether used oil can be managed as non-hazardous waste. Due to the lower flash point, used oil was considered as hazardous waste and spread over coal pile. Campbell indicated that used oil was analyzed again and showed higher flash point than 140 F. Since then, according to the Campbell, used oil has been burned in the boiler #3. The second analysis of used oil was not reviewed.

On August 19, 1991, Campbell submitted the Small Quantity Burner (SQB) Notification to U.S. EPA. The physical stack height was estimated as 30 meters and the maximum quantity of hazardous waste to be burned was determined as 140 gallons per month (from §266.108 (a)(1)).

(II) Inspection Findings and Observed Violations

On May 19, 1993, U.S. EPA performed a BIF Compliance Inspection at Campbell to determine Campbell's compliance with the limits and conditions specified in the SQB Exemption and other requirements of the BIF regulations.

During the inspection, the following potential problems were observed:

(a) Inadequate SQB Notification

40 CFR 266.108 (a)(1) : The quantity of hazardous waste burned in a device for a calendar month does not exceed the limits provided in the following table based on the terrain-adjusted effective stack height as defined in section 266.106(b)(3) :

In the Notification submitted on August 19, 1991, Campbell has failed to determine the terrain-adjusted effective stack height. Campbell has used the physical stack height of 30 meters, and the maximum hazardous waste to be burned in the boilers was determined as 140 gallons per month based on the physical stack height. (See Attachment 1)

During the inspection, Campbell has provided that the exit gas flow rate is 44,000 ACFM (21 CMS) and exit gas temperature is 465 F (513 K). (The plume rise determined from Appendix VI is 27 meters.) Since this facility is located in the generally flat area (based on the visual observation), it is not expected to have higher terrain rise within 5 kilometers of the facility in order to result in the significant reduction of terrain-adjusted

effective stack height. (There was no information available at the facility about the terrain rise within 5 kilometers of the facility.) If necessary, information request can be made to Campbell for topography map within 5 kilometers of the facility. Such information can be used to determine the allowable maximum hazardous waste burning rate and any potential exceedences.

NAPOLEON, OHIO 43545

August 19, 1991

Mr. Gary Victorine (5HR-13)
U.S. Environmental Protection Agency, Region 5
230 S. Dearborn Street
Chicago, Illinois 60604

Dear Mr. Victorine:

RE: **Regulation of the burning of hazardous waste in boilers and industrial furnaces.**

Effective August 21, 1991, the Napoleon Campbell Soup Company facility will be exempt under the small quantity on-site burner exemption. We have made many changes in our operation this past year such as eliminating enamels, recycling solvents, and reducing waste which will allow us to meet this exemption. Based on stack height of thirty meters, we will limit our burning to the allowable 140 gallons per calendar month. The waste burned:

a. Will not exceed 1% of the total fuel requirements of the boiler.
b. Will have a minimum BTU value of 5,000 BTU/lb. as generated.
c. Will not contain hazardous waste no.'s F020, F021, F022, F023, F026, or F027.

Any waste produced over the 140 gallon per month will be removed from the property under R.C.R.A. regulations.

Sincerely,

CAMPBELL SOUP COMPANY

Barry M. Brown
Plant Manager

Attachment 2 : Inspection Check-List

Campbell Soup Co.)
Napoleon, Ohio

IX. SMALL QUANTITY BURNERS

SMALL QUANTITY BURNERS - §266.108

	Yes	No	Comments
1. Did the facility inform EPA with a one-time written notice indicating the following as required by 40 CFR §266.108(d)	✓		
a. The combustion unit is operating as a small quantity burner of hazardous waste	✓		
b. The owner and operator are in compliance with the requirements of this section; and	✓		
c. The maximum quantity of hazardous waste that a facility may burn per month as provided in §266.108(a)(1)?	✓		No Terrai-adjusted-effective stack height was determined Used the physical stack height as the stack height

2. How many stacks does the facility have? One common stack for two coal-fired boilers
(NOTE: If facility burns hazardous waste in more than one on-site boiler or furnace exempt under this part, the quarterly limits are implemented according to the following equation found in §266.108(c):

$$\sum_{i=1}^{n} \frac{\text{Actual Quantity Burned (i)}}{\text{Allowable Quantity Burned (i)}} < 1.0)$$

→ There is one common stack for four Boilers.

3. What is the total height of the stacks? 30 metres (physical height)

IX. SMALL QUANTITY BURNERS(§266.108)

BIF INSPECTION CHECKLIST

4. What is the terrain adjusted effective stack height (TESH) as defined in §266.106(b)(3)?

$$TESH = H_A + H_I - T_r$$

H_A = actual physical stack height
H_I = Plume rise as determined from Apx VI of Part 266 as a function of stack flow rate and stack exhaust temperature
T_r = Terrain rise within 5 kilometers of the stack

30 meters
plume Rise (H_I) was calculated as > 7 meters.
(T_r is not expected to be greater than 7 m due to the flat area)

5. From the table in §266.108(a), how much hazardous waste is the facility allowed to burn per month?

140 gallons/month.

6. How much hazardous waste does the facility burn per month (See Question #11)?
NOTE: The amount of hazardous waste that can be burned by a small quantity burner is a function of the stack height of the burner (See Question 5)

≈ 140 gallons/month.

7. a. What is the percentage of hazardous waste in SQB's fuel?

< 1%

b. Does it exceed 1%?
NOTE: In order to qualify for this exemption, the maximum hazardous waste firing rate an not exceed, at any time, 1 percent of the total fuel requirements for the device (hazardous waste plus other fuel) on a volume basis (266.108(a)(2)).

NO.

8. What is the minimum heating value of the hazardous waste as generated (266.108(a)(3))?
NOTE: To qualify for this exemption, the hazardous waste must have a minimum heating value of 5000 Btu/lb, as generated.

> 5,000 Btu/lb.

(See attachment 3)

IX. SMALL QUANTITY BURNERS (§266.108)

BIF INSPECTION CHECKLIST

	Yes	No	Comments
9. Did the facility perform waste analysis?	✓		for heat value and other parameters. See attachment 3.
10. Does the hazardous waste contain or is it derived from EPA Hazardous Waste Nos. F020, F021, F022, F023, F026, or F027? NOTE: The hazardous wastes listed above are dioxin or dioxin-derived hazardous waste and may not be burned in a BIF unit (§266.108(a)(4)).		✓	

11. Conduct the following verification steps:

Parameter	Allowable	Observed	Comments
a. Quantity of hazardous waste burned in a calendar month - based on TESH* and limits in §266.108(a)(1)	140 gallons/HR	≤140 gallons/month.	
b. Minimum heating value	5,000 Btu/lb	>5,000	
c. Content in hazardous waste of F020, F021, F022, F023, F026 or F027	0	0	
d. Maximum hazardous waste firing rate as percentage of total fuel requirements	1%	<1%	

* TESH - Terrain Adjusted Effective Stack Height (See Question #4 to this section)

12. Storage: Check the facility records for the following information:

	Yes	No*	Comments
a. Is hazardous waste stored on-site?		✓	short period of time < 1 month.
b. If yes, is it hazardous waste other than the 1% fuel mixture stored in units other than tanks that feed fuel directly to the burner?	[1]		

If the waste is accumulated in accordance with the generator accumulation provisions of §262.34, refer to OSWER Directive No. 9938.2A, RCRA Inspection Manual, Containers Checklist

If the hazardous waste is stored in regulated storage units, refer to the appropriate Part 264/265 checklists in OSWER Directive No. 9938.2A, RCRA Inspection Manual

* **Potential Violation**

[1] If yes, units must comply with 40 CFR Part 264 or Part 265 requirements, whichever are appropriate.

13. Recordkeeping Requirements (§266.108(e))

	Yes	No	Comments
Does the facility have records documenting:			
a. Hazardous waste quantity burned per month? (Does the facility comply with limits set in Questions 5 and 6?)	✓		
b. Firing rate?	✓		
c. Heating value of hazardous waste?	✓		

STACK DATA

16. Your stack identification #1 & #2 Boilers

17. Are other sources vented to this stack? ☒ Yes ☐ No
If yes, identify sources #2 Boiler

18. Type: Round, top inside diameter dimension 6.5
Rectangular, top inside dimensions (L)____ x (W)____

19. Height: Above roof 26.2 ft., above ground____ ft.

20. Exit gas: Temp. 465 °F, Volume 44,000 ACFM, Velocity 2,460 ft./min.

21. Continuous monitoring equipment ☒ Yes ☐ No
If yes, indicate type Opacity, Manufacturer Lear Siegler
Make or Model RM41, Pollutant(s) monitored Particula

22. Emission data: Emissions from this source have been determined and such data is included with this appendix: ☐ Yes ☒ No
If yes, check method: ☐ Stack Test ☐ Emission factor

New stack test will be completed within 60 days and results forwarded to E.P.A.

Completed by H.H. Salsbury, Date Dec. 199

$$44{,}000 \frac{ft^3}{min} \times \left(\frac{1\,m}{3.281\,ft}\right)^3 \times \frac{1\,min}{60\,sec} = 20.8 \frac{m^3}{sec}$$

$$465\,^\circ R = \frac{(465\,^\circ F - 32)}{1.8} + 273.15 = 513\,K$$

SECTION III HEALTH INFORMATION

THE HEALTH EFFECTS NOTED BELOW ARE CONSISTENT WITH REQUIREMENTS UNDER THE OSHA HAZARD COMMUNICATION STANDARD (29 CFR 1910.1200).

EYE CONTACT
LIQUID IS MINIMALLY IRRITATING TO THE EYES. HIGH VAPOR CONCENTRATIONS MAY CAUSE IRRITATION.

SKIN CONTACT
LIQUID IS SLIGHTLY IRRITATING TO THE SKIN. PROLONGED OR REPEATED LIQUID CONTACT CAN RESULT IN DEFATTING AND DRYING OF THE SKIN WHICH MAY RESULT IN SKIN IRRITATION AND DERMATITIS.

SECTION VII PHYSICAL DATA

BOILING POINT: 330-390 (DEG F)

SPECIFIC GRAVITY: 0.79 (H2O=1)

VAPOR PRESSURE: 16*@100 DEG. (MM HG)

MELTING POINT: NOT AVAILABLE (DEG F)

SOLUBILITY: (IN WATER) NEGLIGIBLE

VAPOR DENSITY: 4.8* (AIR=1)

EVAPORATION RATE (N-BUTYL ACETATE = 1): <0.1*

*ESTIMATED

APPEARANCE AND ODOR:
LIGHT COLORED LIQUID. HYOROCARBON DOOR.

SECTION VIII FIRE AND EXPLOSION HAZARDS

FLASH POINT AND METHOD:
114 DEG. F (TCC)

FLAMMABLE LIMITS /% VOLUME IN AIR
LOWER: 1 UPPER: 6

EXTINGUISHING MEDIA
USE WATER FOG, FOAM, ORY CHEMICAL OR CO2. DO NOT USE A DIRECT STREAM OF WATER. PRODUCT WILL FLOAT AND CAN BE REIGNITED ON SUFACE OF WATER.

SPECIAL FIRE FIGHTING PROCEDURES AND PRECAUTIONS
CAUTION. COMBUSTIBLE. OD NOT ENTER CONFINED FIRE SPACE WITHOUT FULL BUNKER GEAR (HELMET WITH FACE SHIELD, BUNKER COATS, GLOVES AND RUBBER BOOTS), INCLUDING A POSITIVE PRESSURE NIOSH APPROVED SELF-CONTAINED BREATHING APPARATUS. COOL FIRE EXPOSED CONTAINERS WITH WATER.

UNUSUAL FIRE AND EXPLOSION HAZARDS
CONTAINERS EXPOSED TO INTENSE HEAT FROM FIRES SHOULD BE COOLED WITH WATER TO PREVENT VAPOR PRESSURE BUILOUP WHICH COULD RESULT IN CONTAINER RUPTURE. CONTAINER AREAS EXPOSED TO OIRECT FLAME CONTACT SHOULD BE COOLED WITH LARGE QUANTITIES OF WATER AS NEEDED TO PREVENT WEAKENING OF CONTAINER STRUCTURE.

SECTION IX REACTIVITY

STABILITY: STABLE

HAZARDOUS POLYMERIZATION: WILL NOT OCCUR

CONDITIONS AND MATERIALS TO AVOID:
AVOID HEAT, FLAME AND CONTACT WITH STRONG OXIDIZING AGENTS.

HAZARDOUS DECOMPOSITION PRODUCTS
CARBON MONOXIDE AND UNIDENTIFIED ORGANIC COMPOUNOS MAY BE FORMED DURING COMBUSTION.

SECTION X EMPLOYEE PROTECTION

RESPIRATORY PROTECTION
AVOID PROLONGED OR REPEATED BREATHING OF VAPORS. IF EXPOSURE MAY OR DOES EXCEED OCCUPATIONAL EXPOSURE LIMITS (SEC. IV) USE A NIOSH-APPROVED RESPIRATOR TO PREVENT OVEREXPOSURE. IN ACCORD WITH 29 CFR 1910.134 USE EITHER AN ATMOSPHERE-SUPPLYING RESPIRATOR OR AN AIR-PURIFYING RESPIRATOR FOR ORGANIC VAPORS.

PROTECTIVE CLOTHING
AVOID CONTACT WITH EYES. WEAR SAFETY GLASSES OR GOGGLES AS APPROPRIATE. AVOID PROLONGED OR REPEATED CONTACT WITH SKIN. WEAR CHEMICAL-RESISTANT GLOVES AND OTHER CLOTHING AS REQUIRED TO MINIMIZE CONTACT.

ITIONAL PROTECTIVE MEASURES
EXPLOSION-PROOF VENTILATION AS REQUIRED TO CONTROL VAPOR CONCENTRATIONS. AIR-DRY CONTAMINATED THING IN A WELL VENTILATED AREA, THEN LAUNDER BEFORE REUSING.

TION XI ENVIRONMENTAL PROTECTION

LL OR LEAK PROCEDURES
TION. COMBUSTIBLE. *** LARGE SPILLS *** ELIMINATE POTENTIAL SOURCES OF IGNITION. WEAR ROPRIATE RESPIRATOR AND OTHER PROTECTIVE CLOTHING. SHUT OFF SOURCE OF LEAK ONLY IF SAFE TO DO DIKE AND CONTAIN. REMOVE WITH VACUUM TRUCKS OR PUMP TO STORAGE/SALVAGE VESSELS. SOAK UP IDUE WITH AN ABSORBENT SUCH AS CLAY, SAND, OR OTHER SUITABLE MATERIAL; PLACE IN NON-LEAKING TAINERS AND SEAL TIGHTLY FOR PROPER DISPOSAL. FLUSH AREA WITH WATER TO REMOVE TRACE RESIDUE; POSE OF FLUSH SOLUTION AS ABOVE. *** SMALL SPILLS *** TAKE UP WITH AN ABSORBENT MATERIAL AND CE IN NON-LEAKING CONTAINERS FOR PROPER DISPOSAL.

TION XII SPECIAL PRECAUTIONS

P LIQUID AND VAPOR AWAY FROM HEAT, SPARKS AND FLAME. SURFACES THAT ARE SUFFICIENTLY HOT MAY ITE EVEN LIQUID PRODUCT IN THE ABSENCE OF SPARKS OR FLAME. EXTINGUISH PILOT LIGHTS, CIGARETTES TURN OFF OTHER SOURCES OF IGNITION PRIOR TO USE AND UNTIL ALL VAPORS ARE GONE. VAPORS MAY UMULATE AND TRAVEL TO IGNITION SOURCES DISTANT FROM THE HANDLING SITE; FLASH-FIRE CAN RESULT. P CONTAINERS CLOSED WHEN NOT IN USE. USE WITH ADEQUATE VENTILATION.

TAINERS, EVEN THOSE THAT HAVE BEEN EMPTIED, CAN CONTAIN EXPLOSIVE VAPORS. DO NOT CUT, DRILL, ND, WELD OR PERFORM SIMILAR OPERATIONS ON OR NEAR CONTAINERS.

TIC ELECTRICITY MAY ACCUMULATE AND CREATE A FIRE HAZARD. GROUND FIXED EQUIPMENT. BOND AND ND TRANSFER CONTAINERS AND EQUIPMENT.

TION XIII TRANSPORTATION REQUIREMENTS

RTMENT OF TRANSPORTATION CLASSIFICATION:
USTIBLE LIQUID

T. PROPER SHIPPING NAME:
OLEUM NAPHTHA

R REQUIREMENTS:
255. GUIDE SHEET 27.

TION XIV OTHER REGULATORY CONTROLS

ONENT #2 IS THE SUBJECT OF A TSCA SECTION 4 TEST RULE. EXPORT OF THIS PRODUCT IS THEREFORE IBITED WITHOUT NOTIFICATION TO EPA. THE COMPONENTS OF THIS PRODUCT ARE LISTED ON THE EPA/TSCA NTORY OF CHEMICAL SUBSTANCES.

ION XV SPECIAL NOTES

ION XI - ENVIRONMENTAL PROTECTION HAS BEEN REVISED. THE INFORMATION IN THE "WASTE DISPOSAL" "ENVIRONMENT PROTECTION" HAS BEEN REMOVED AND INCLUDED IN THE ATTACHED ENVIRONMENTAL DATA . IN ACCORDANCE WITH SARA TITLE III, SECTION 313, THE EOS SHOULD ALWAYS BE COPIED AND SENT THE MSDS.

OHIO E.P.A.
N.W.D.O.

Patrick J. Mead
Inkjet, Inc.
7015 College Boulevard, Suite 640
Overland Park, KS 66211

Dear Mr. Mead:

This letter is in response to our phone conversation and your facsimile of December 17, 1992 in which you inquired if empty containers used by Campbell Soup in Napoleon, OH, could be disposed of as solid waste. These containers formerly held aqueous-based ink.

There are two points that must be determined: 1) Is the aqueous-based ink a RCRA hazardous waste, and 2) Are the containers empty? Under the Resource Conservation and Recovery Act, a waste is hazardous if it is listed in the regulations or, if not listed, it exhibits one or more of the four hazardous characteristics. These are ignitability, corrosivity, reactivity, or toxicity. I have enclosed rules 3745-51-20 through 3745-51-24 from the Ohio Administrative Code (OAC) which are used to determine the characteristics of hazardous wastes. It is the responsibility of the generator of a waste to ascertain if it is hazardous, either through knowledge of the waste stream or by use of analytical tests.

If it is determined that the ink in the containers was not hazardous, the containers may be disposed of or recycled as solid waste. If the ink is found to be hazardous, then the containers may be disposed of as solid waste only if they are "RCRA empty." If they contain hazardous ink and do not meet the definition of "RCRA empty," then they must be managed and disposed of as hazardous waste. Enclosed is a copy of Ohio Administrative Code 3745-51-07 which establishes the limits for determining if a container is empty and therefore not subject to the RCRA requirements.

If you have any further questions, feel free to call me at (614) 644-2956.

Sincerely,

Judith Brazis

3745-51-07 Residues of hazardous waste in empty containers

(A)(1) Any hazardous waste remaining in either an empty container or an inner liner removed from an empty container, as defined in paragraph (B) of this rule, is not subject to regulation under rules 3745-50-40 to 3745-50-62 or Chapters 3745-51 to 3745-57, 3745-59, or 3745-65 to 3745-69 of the Administrative Code or Chapter 119. of the Revised Code or to the notification requirements of Chapter 3734. of the Revised Code.

(2) Any hazardous waste in either a container that is not empty or an inner liner removed from a container that is not empty, as defined in paragraph (B) of this rule, is subject to regulation under rules 3745-50-40 to 3745-50-62 and Chapters 3745-51 to 3745-57, 3745-59, and 3745-65 to 3745-69 of the Administrative Code and to the notification requirements of Chapter 3734. of the Revised Code.

(B)(1) A container or an inner liner removed from a container that has held any hazardous waste, except a waste that is a compressed gas or that is identified as an acute hazardous waste in rule 3745-51-31, 3745-51-32, or paragraph (E) of rule 3745-51-33 of the Administrative Code, is empty if:

(a) All wastes have been removed that can be removed using the practices commonly employed to remove materials from that type of container, e.g., pouring, pumping, and aspirating; and

(b) No more than 2.5 centimeters (one inch) of residue remain on the bottom of the container or inner liner; or

(c)(i) No more than three per cent by weight of the total capacity of the container remains in the container or inner liner if the container is less than or equal to one hundred ten gallons in size; or

(ii) No more than 0.3 per cent by weight of the total capacity of the container remains in the container or inner liner if the container is greater than one hundred ten gallons in size.

(2) A container that has held a hazardous waste that is a compressed gas is empty when the pressure in the container approaches atmospheric.

(3) A container or an inner liner removed from a container that has held an acute hazardous waste listed in rule 3745-51-31, 3745-51-32, or paragraph (E) of rule 3745-51-33 of the Administrative Code is empty if:

(a) The container or inner liner has been triple rinsed using a solvent capable of removing the commercial chemical product or manufacturing chemical intermediate;

(b) The container or inner liner has been cleansed by another method that has been shown in the scientific literature, or by tests conducted by the generator, to achieve equivalent removal; or

(c) In the case of a container, the inner liner that prevented contact of the commercial chemical product or manufacturing chemical intermediate with the container, has been removed.

HISTORY: Eff. 12-30-89 (1989-90 OMR 567)
1985-86 OMR 667, 172; 1984-85 OMR 1321; 12-2-81

Note: Effective 11-24-81, former 3745-51-07 (8-26-81) expired.

3745-51-10 Criteria for identifying the characteristics of hazardous waste

The director shall identify and define a characteristic of hazardous waste in rules 3745-51-20 and 3745-51-24 of the Administrative Code only upon determining that:

(A) A waste that exhibits the characteristic may:

(1) Cause, or significantly contribute to, an increase in mortality or an increase in serious irreversible, or incapacitating reversible illness; or

(2) Pose a substantial present or potential hazard to human health or the environment when it is improperly treated, stored, transported, disposed of or otherwise managed; and

(B) The characteristic can be:

(1) Measured by an available standardized test method which is reasonably within the capability of generators of solid waste or private sector laboratories that are available to serve generators of solid waste; or

(2) Reasonably detected by generators of waste through their knowledge of their waste.

HISTORY: Eff. 8-29-85 (1985-86 OMR 173)
1984-85 OMR 1321

Note: Effective 12-2-81, former 3745-51-10 (8-26-81) was repealed.

CROSS REFERENCES

RC 3734.12, Guidelines for hazardous waste rules and standards; disposal of certain wastes may be prohibited; rules may be more stringent than federal law

3745-51-11 Criteria for listing hazardous waste

(A) The director shall list a waste as a hazardous waste only upon determining that the waste meets one of the following criteria:

(1) It exhibits any of the characteristics of hazardous waste identified in rules 3745-51-20 to 3745-51-24 of the Administrative Code.

(2) It has been found to be fatal to humans in low doses or, in the absence of data on human toxicity, it has been shown in studies to have an oral LD50 toxicity (rat) of less

3745-51-22 Characteristic of corrosivity.

(A) A waste exhibits the characteristic of corrosivity if a representative sample of the waste has either of the following properties:

(1) It is aqueous and has a pH less than or equal to two or greater than or equal to 12.5, as determined by a pH meter using either the test method specified in the "Test Methods for the Evaluation of Solid Waste, Physical/Chemical Methods" (incorporated by reference, see rule 3745-50-11 of the Administrative Code and also described in "Methods for Analysis of Water and Wastes" EPA 600/4-79-020, March 1979) or an equivalent test method authorized for use by the administrator under the procedures set forth in 40 CFR Sections 260.20 and 260.21.

(2) It is a liquid and corrodes steel (SAE 1020) at a rate greater than 6.35 mm (0.250 inch) per year at a test temperature of fifty-five degrees C (one hundred thirty degrees F) as determined by the test method specified in "NACE Standard TM-01-69" as standardized in "Test Methods for the Evaluation of Solid Waste, Physical/Chemical Methods" (incorporated by reference, see rule 3745-50-11 of the Administrative Code) or an equivalent test method authorized for use by the administrator under the procedures set forth in 40 CFR Sections 260.20 and 260.21.

(B) A waste that exhibits the characteristic of corrosivity~~, but is not listed as a hazardous waste in this chapter,~~ shall have the Ohio EPA hazardous waste number of D002.

Effective: FEB 11 1992

CERTIFICATION

JAN 30 1992
Date

Promulgated under: RC Chapter 119
Rule amplifies: RC Section 3734.12, 6111.05
Prior effective dates: 4/15/81, 12/2/81, 5/29/85 (Emer.), 8/29/85

3745-51-21 Characteristic of ignitability.

(A) A waste exhibits the characteristic of ignitability if a representative sample of the waste has any of the following properties:

(1) It is a liquid, other than an aqueous solution containing less than twenty-four per cent alcohol by volume, and has a flash point less than sixty degrees C (one hundred forty degrees F), as determined by a "Pensky-Martens Closed Cup Tester," using the test method specified in "ASTM Standard D-93-79 or D-93-80" (incorporated by reference, see rule 3745-50-11 of the Administrative Code), or a "Setaflash Closed Cup Tester," using the test method specified in "ASTM Standard D-3278-78" (incorporated by reference, see rule 3745-50-11 of the Administrative Code), or as determined by an equivalent test method authorized for use by the administrator under the procedures set forth in 40 CFR Sections 260.20 and 260.21.

(2) It is not a liquid and is capable, under standard temperature and pressure, of causing fire through friction, absorption of moisture or spontaneous chemical changes and, when ignited, burns so vigorously and persistently that it creates a hazard.

(3) It is an ignitable compressed gas as defined in 49 CFR Section 173.300 and as determined by the test methods described in that regulation or equivalent test methods authorized by use by the administrator under the procedures set forth in 40 CFR Sections 260.20 and 260.21.

(4) It is an oxidizer as defined in 49 CFR Section 173.151.

(B) A waste that exhibits the characteristic of ignitability~~, but is not listed as a hazardous waste in this chapter,~~ shall have the Ohio EPA hazardous waste number of D001.

Effective: FEB 1 1 1992

2 QUANTITATION LIMIT IS GREATER THAN THE CALCULATED REGULATORY LEVEL. THE QUANTITATION LIMIT THEREFORE BECOMES THE REGULATORY LEVEL.

3 IF O-, M-, AND P-CRESOL CONCENTRATIONS CANNOT BE DIFFERENTIATED, THE TOTAL CRESOL (D026) CONCENTRATION IS USED. THE REGULATORY LEVEL OF TOTAL CRESOL IS 200 MG/L.

TO BE ENACTED

3745-51-24 TOXICITY CHARACTERISTIC.

(A) A WASTE EXHIBITS THE CHARACTERISTIC OF TOXICITY IF, USING THE TEST METHODS DESCRIBED IN THE APPENDIX OF THIS RULE, OR AN EQUIVALENT TEST METHOD AUTHORIZED FOR USE BY THE ADMINISTRATOR UNDER THE PROCEDURES SET FORTH IN 40 CFR 260.20 AND 260.21, THE EXTRACT FROM A REPRESENTATIVE SAMPLE OF THE WASTE CONTAINS ANY OF THE CONTAMINANTS LISTED IN TABLE 1 OF THIS RULE AT A CONCENTRATION EQUAL TO OR GREATER THAN THE RESPECTIVE VALUE GIVEN IN THAT TABLE. WHERE THE WASTE CONTAINS LESS THAN 0.5 PER CENT FILTERABLE SOLIDS, THE WASTE ITSELF, AFTER FILTERING USING THE METHODOLOGY OUTLINED IN THE APPENDIX TO THIS RULE, IS CONSIDERED TO BE THE EXTRACT FOR THE PURPOSES OF THIS RULE.

(B) A WASTE THAT EXHIBITS THE CHARACTERISTIC OF TOXICITY SHALL HAVE THE OHIO EPA HAZARDOUS WASTE NUMBER SPECIFIED IN TABLE 1 OF THIS RULE WHICH CORRESPONDS TO THE TOXIC CONTAMINANT CAUSING IT TO BE HAZARDOUS.

3745-51-23 Characteristic of reactivity.

(A) A waste exhibits the characteristic of reactivity if a representative sample of the waste has any of the following properties:

(1) It is normally unstable and readily undergoes violent change without detonating.

(2) It reacts violently with water.

(3) It forms potentially explosive mixtures with water.

(4) When mixed with water, it generates toxic gases, vapors or fumes in a quantity sufficient to present a danger to human health or the environment.

(5) It is a cyanide or sulfide bearing waste which, when exposed to pH conditions between two and 12.5, can generate toxic gases, vapors or fumes in a quantity sufficient to present a danger to human health or the environment.

(6) It is capable of detonation or explosive reaction if it is subjected to a strong initiating source or if heated under confinement.

(7) It is readily capable of detonation or explosive decomposition or reaction at standard temperature and pressure.

(8) It is a forbidden explosive as defined in 49 CFR Section 173.51, or a "Class A" explosive as defined in 49 CFR Section 173.53 or a "Class B" explosive as defined in 49 CFR Section 173.88.

(B) A waste that exhibits the characteristic of reactivity~~, but is not listed as a hazardous waste in this chapter,~~ shall have the Ohio EPA hazardous waste number of D003.

Columbus, Ohio 43266-1049

Dear Ms. Allen:

Enclosed please find a copy of a June 20, 1993, Boiler and Industrial Furnace (BIF) Inspection Report for Campbell Soup Company (Campbell Soup), Napoleon, Ohio, EPA I.D. No. OHD 005 419 171. During the BIF inspection conducted by the United States Environmental Protection Agency on May 19, 1993, it was discovered that Campbell Soup was placing spent solvents on an outside coal pile prior to burning the spent solvents and coal in a boiler.

This inspection report is being transmitted to the Ohio Environmental Protection Agency (OEPA) in order for OEPA to evaluate the compliance of Campbell Soup with applicable provisions of the Ohio Administrative Code rules for treatment, storage, and disposal facilities along with applicable Land Disposal Restrictions. Thank you for your attention to this matter.

Sincerely yours,

Kevin M. Pierard, Chief
MN/OH Technical Enforcement Section

Enclosure

cc: David Sholtis

Responsible Official of Campbell Soup Co.:

Herbert H. Salsbury: Manager, Services & Utilities

Applicable Regulations:

40 C.F.R. Parts 266.108 : Small Quantity Burner Exemptions

Purpose of Inspection:

This inspection is a routine Compliance Evaluation Inspection of Campbell Soup Company, Napoleon, Ohio, pursuant to Section 3007 of RCRA, for the evaluation of Campbell's compliance with the requirements of RCRA and the newly promulgated regulations concerning the burning of hazardous waste and other related activities of Boilers and Industrial Furnaces (BIFs) published in 40 C.F.R. Part 266 Subpart H.

(I) Facility Description

Campbell Soup Company (Campbell) generates spent solvent liquid waste (mostly "O" thinner) as a result of its maintenance activities. This waste material was burned in the two coal-fired boilers with one common stack at Campbell facility to produce steam. Waste solvent collected from the various parts maintenance locations were brought to the coal pile in the 50-gallons can. Campbell indicated that there are 22 parts maintenance locations in the facility and each maintenance location generates approximately up to 50 gallons of waste solvent. The collected waste solvent was manually spread (walking through at the top of coal pile) at the top of coal pile located in the yard. It was not known how well the waste solvent was mixed with coal pile (i.e., the degree of uniform mixing with total mass of coal). Based on the operating log, up to 140 gallons per month of waste solvent was generated and spread over the coal pile. However, it was not known whether all of these 140 gallons of waste were generated at one time or at different time within the month. Campbell has indicated that there were usually 3,000 Tons of coal in the yard. Approximately 100 Tons of coals were used to be burned in the boilers daily and 100 Tons of coals were brought into the coal pile daily. According to the Campbell's historical operating log, approximately 20 to 140 gallons per month of liquid hazardous waste were burned from September 1991 to January 1993. Due to the internal waste recycling program, no waste has been generated since January of 1993 (the exact date was not known). Since waste solvent was carried to the coal pile as it generated, no waste solvent was stored at the facility.

There was no monitored or recorded firing rate of hazardous waste available at the facility. Therefore, the determination whether the maximum hazardous waste firing rate have exceeded at any time 1 percent of the total fuel requirements could not be made. Based on the worst possible scenario, it can be assumed that the maximum hazardous waste (140 gallons) was generated at the same time and spread over only portion of daily usage coal pile (around 100 Tons of coal). Based on the 8.0 Ib/gallon waste density, the 1 percent firing rate of hazardous waste would be 253 gallons (based on the above worst possible scenario). If the waste solvent was spread over very small amount of coal, then it is possible that the firing rate of hazardous waste might have exceeded the 1 percent criteria. Since the heating values of coal (around 13,000 Btu/Ib) and waste solvent (17,000 Btu/Ib) were similar, it is expected that the maximum hazardous waste firing rate would not exceed 1 percent of the total fuel requirements on a total heat input. The Material Safety Data Sheet indicates that "O" thinner has heating value as 17,300 Btu/Ib.

Campbell has indicated that used oil generated at the facility was burned in the boiler #3 (oil-fired boiler). In October 1991, Campbell has analyzed used oil to determine whether used oil can be managed as non-hazardous waste. Due to the lower flash point, used oil was considered as hazardous waste and spread over coal pile. Campbell indicated that used oil was analyzed again and showed higher flash point than 140 F. Since then, according to the Campbell, used oil has been burned in the boiler #3. The second analysis of used oil was not reviewed.

On August 19, 1991, Campbell submitted the Small Quantity Burner (SQB) Notification to U.S. EPA. The physical stack height was estimated as 30 meters and the maximum quantity of hazardous waste to be burned was determined as 140 gallons per month (from §266.108 (a)(1)).

(II) Inspection Findings and Observed Violations

On May 19, 1993, U.S. EPA performed a BIF Compliance Inspection at Campbell to determine Campbell's compliance with the limits and conditions specified in the SQB Exemption and other requirements of the BIF regulations.

During the inspection, the following potential problems were observed:

(a) Inadequate SQB Notification

40 CFR 266.108 (a)(1) : The quantity of hazardous waste burned in a device for a calendar month does not exceed the limits provided in the following table based on the terrain-adjusted effective stack height as defined in section 266.106(b)(3) :

In the Notification submitted on August 19, 1991, Campbell has failed to determine the terrain-adjusted effective stack height. Campbell has used the physical stack height of 30 meters, and the maximum hazardous waste to be burned in the boilers was determined as 140 gallons per month based on the physical stack height. (See Attachment 1)

During the inspection, Campbell has provided that the exit gas flow rate is 44,000 ACFM (21 CMS) and exit gas temperature is 465 F (513 K). (The plume rise determined from Appendix VI is 27 meters.) Since this facility is located in the generally flat area (based on the visual observation), it is not expected to have higher terrain rise within 5 kilometers of the facility in order to result in the significant reduction of terrain-adjusted

effective stack height. (There was no information available at the facility about the terrain rise within 5 kilometers of the facility.) If necessary, information request can be made to Campbell for topography map within 5 kilometers of the facility. Such information can be used to determine the allowable maximum hazardous waste burning rate and any potential exceedences.

NAPOLEON, OHIO 43545

August 19, 1991

Mr. Gary Victorine (5HR-13)
U.S. Environmental Protection Agency, Region 5
230 S. Dearborn Street
Chicago, Illinois 60604

Dear Mr. Victorine:

RE: Regulation of the burning of hazardous waste in boilers and industrial furnaces.

Effective August 21, 1991, the Napoleon Campbell Soup Company facility will be exempt under the small quantity on-site burner exemption. We have made many changes in our operation this past year such as eliminating enamels, recycling solvents, and reducing waste which will allow us to meet this exemption. Based on stack height of thirty meters, we will limit our burning to the allowable 140 gallons per calendar month. The waste burned:

a. Will not exceed 1% of the total fuel requirements of the boiler.
b. Will have a minimum BTU value of 5,000 BTU/lb. as generated.
c. Will not contain hazardous waste no.'s F020, F021, F022, F023, F026, or F027.

Any waste produced over the 140 gallon per month will be removed from the property under R.C.R.A. regulations.

Sincerely,

CAMPBELL SOUP COMPANY

Harry M. Brown
Plant Manager

8-20

Attachment 2 : Inspection Check-List

Campbell Soup Co.)
Napoleon, Ohio

IX. SMALL QUANTITY BURNERS

SMALL QUANTITY BURNERS - §266.108

	Yes	No	Comments
1. Did the facility inform EPA with a one-time written notice indicating the following as required by 40 CFR §266.108(d)	✓		
a. The combustion unit is operating as a small quantity burner of hazardous waste	✓		
b. The owner and operator are in compliance with the requirements of this section; and	✓		
c. The maximum quantity of hazardous waste that a facility may burn per month as provided in §266.108(a)(1)?	✓		No Terrai-adjusted - effective stack height was determined used the physical stack height is same as the stack height

2. How many stacks does the facility have? One Common stack for two coal-fired boilers
(NOTE: If facility burns hazardous waste in more than one on-site boiler or furnace exempt under this part, the quarterly limits are implemented according to the following equation found in §266.108(c):

$$\sum_{i=1}^{n} \frac{\text{Actual Quantity Burned (i)}}{\text{Allowable Quantity Burned (i)}} < 1.0)$$

→ There is one Common stack for three Boilers

3. What is the total height of the stacks? 30 meters (Physical height)

4. What is the terrain adjusted effective stack height (TESH) as defined in §266.106(b)(3)?

$$TESH = Ha + H_1 - T_r$$

Ha = actual physical stack height
H_1 = Plume rise as determined from Apx VI of Part 266 as a function of stack flow rate and stack exhaust temperature
T_r = Terrain rise within 5 kilometers of the stack

30 meters
plume Rise (H_1) was calculated to be > 7 meters.
(T_r is not expected to be greater than 27 m due to the flat area)

5. From the table in §266.108(a), how much hazardous waste is the facility allowed to burn per month?

140 gallons/month

6. How much hazardous waste does the facility burn per month (See Question #11)?
NOTE: The amount of hazardous waste that can be burned by a small quantity burner is a function of the stack height of the burner (See Question 5)

≈ 140 gallons/month.

7. a. What is the percentage of hazardous waste in SQB's fuel?

< 1%

b. Does it exceed 1%?
NOTE: In order to qualify for this exemption, the maximum hazardous waste firing rate an not exceed, at any time, 1 percent of the total fuel requirements for the device (hazardous waste plus other fuel) on a volume basis (266.108(a)(2)).

NO.

8. What is the minimum heating value of the hazardous waste as generated (266.108(a)(3))?
NOTE: To qualify for this exemption, the hazardous waste must have a minimum heating value of 5000 Btu/lb, as generated.

> 5,000 Btu/lb

(See attachment 3)

	Yes	No	Comments
9 Did the facility perform waste analysis?	✓		for heat value and other parameters - See attachment 3.
10. Does the hazardous waste contain or is it derived from EPA Hazardous Waste Nos. F020, F021, F022, F023, F026, or F027? NOTE: The hazardous wastes listed above are dioxin or dioxin-derived hazardous waste and may not be burned in a BIF unit (§266.108(a)(4)).		✓	

11. Conduct the following verification steps:

Parameter	Allowable	Observed	Comments
a. Quantity of hazardous waste burned in a calendar month - based on TESH* and limits in §266.108(a)(1)	1440 gallons/hr	≤ 1440 gallons/month.	
b. Minimum heating value	5,000 Btu/lb	> 5,000	
c. Content in hazardous waste of F020, F021, F022, F023, F026 or F027	0	0	
d. Maximum hazardous waste firing rate as percentage of total fuel requirements	1%	< 1%	

* TESH - Terrain Adjusted Effective Stack Height (See Question #4 to this section)

IX. SMALL QUANTITY BURNERS(§266.108)

BIF INSPECTION CHECKLIST

12. Storage: Check the facility records for the following information:

	Yes	No*	Comments
a. Is hazardous waste stored on-site?		✓	short period of time < 1 month.
b. If yes, is it hazardous waste other than the 1% fuel mixture stored in units other than tanks that feed fuel directly to the burner?	[1]		

If the waste is accumulated in accordance with the generator accumulation provisions of §262.34, refer to OSWER Directive No. 9938.2A, RCRA Inspection Manual, Containers Checklist

If the hazardous waste is stored in regulated storage units, refer to the appropriate Part 264/265 checklists in OSWER Directive No. 9938.2A, RCRA Inspection Manual

* **Potential Violation**

[1] If yes, units must comply with 40 CFR Part 264 or Part 265 requirements, whichever are appropriate.

13. Recordkeeping Requirements (§266.108(e))

	Yes	No	Comments
Does the facility have records documenting:			
a. Hazardous waste quantity burned per month? (Does the facility comply with limits set in Questions 5 and 6?)	✓		
b. Firing rate?	✓		
c. Heating value of hazardous waste?	✓		

STACK DATA

16. Your stack identification #1 & #2 Boilers

17. Are other sources vented to this stack? ☒ Yes ☐ No
If yes, identify sources #2 Boiler

18. Type: Round, top inside diameter dimension 6.5
Rectangular, top inside dimensions (L)_____ x (W)_____

19. Height: Above roof 26.2 ft., above ground_____ ft.

20. Exit gas: Temp. 465 °F, Volume 44,000 ACFM, Velocity 2,460 ft./min

21. Continuous monitoring equipment ☒ Yes ☐ No
If yes, indicate type Opacity, Manufacturer Lear Siegler
Make or Model RM41, Pollutant(s) monitored Particul

22. Emission data: Emissions from this source have been determined and such data is included with this appendix: ☐ Yes ☒ No
If yes, check method: ☐ Stack Test ☐ Emission factor

New stack test will be completed within 60 days and results forwarded to E.P.A.

Completed by H.H. Salsbury, Date Dec. 19

$$44{,}000 \frac{ft^3}{Min} \times \left(\frac{1m}{3.281ft}\right)^3 \times \frac{1 Min}{60 sec} = 20.8 \frac{m^3}{sec}$$

$$465°F = \frac{(465°F - 32)}{1.8} + 273.15 = 513 K$$

SECTION III HEALTH INFORMATION

THE HEALTH EFFECTS NOTED BELOW ARE CONSISTENT WITH REQUIREMENTS UNDER THE OSHA HAZARD COMMUNICATION STANDARD (29 CFR 1910.1200).

EYE CONTACT
LIQUID IS MINIMALLY IRRITATING TO THE EYES. HIGH VAPOR CONCENTRATIONS MAY CAUSE IRRITATION.

SKIN CONTACT
LIQUID IS SLIGHTLY IRRITATING TO THE SKIN. PROLONGED OR REPEATED LIQUID CONTACT CAN RESULT IN DEFATTING AND DRYING OF THE SKIN WHICH MAY RESULT IN SKIN IRRITATION AND DERMATITIS.

SECTION VII PHYSICAL DATA

BOILING POINT: 330-390 (DEG F)

SPECIFIC GRAVITY: 0.79 (H2O=1)

VAPOR PRESSURE: 16*@100 DEG. (MM HG)

MELTING POINT: NOT AVAILABLE (DEG F)

SOLUBILITY: (IN WATER) NEGLIGIBLE

VAPOR DENSITY: 4.8* (AIR=1)

EVAPORATION RATE (N-BUTYL ACETATE = 1): <0.1*

*ESTIMATED

APPEARANCE AND ODOR:
LIGHT COLORED LIQUID. HYDROCARBON ODOR.

SECTION VIII FIRE AND EXPLOSION HAZARDS

FLASH POINT AND METHOD:
114 DEG. F (TCC)

FLAMMABLE LIMITS /% VOLUME IN AIR
LOWER: 1 UPPER: 6

EXTINGUISHING MEDIA
USE WATER FOG, FOAM, DRY CHEMICAL OR CO2. DO NOT USE A DIRECT STREAM OF WATER. PRODUCT WILL FLOA AND CAN BE REIGNITED ON SUFACE OF WATER.

SPECIAL FIRE FIGHTING PROCEDURES AND PRECAUTIONS
CAUTION. COMBUSTIBLE. DO NOT ENTER CONFINED FIRE SPACE WITHOUT FULL BUNKER GEAR (HELMET WITH FAC SHIELD, BUNKER COATS, GLOVES AND RUBBER BOOTS), INCLUDING A POSITIVE PRESSURE NIOSH APPROVED SELF-CONTAINED BREATHING APPARATUS. COOL FIRE EXPOSED CONTAINERS WITH WATER.

UNUSUAL FIRE AND EXPLOSION HAZARDS
CONTAINERS EXPOSED TO INTENSE HEAT FROM FIRES SHOULD BE COOLED WITH WATER TO PREVENT VAPOR PRESSUR BUILDUP WHICH COULD RESULT IN CONTAINER RUPTURE. CONTAINER AREAS EXPOSED TO DIRECT FLAME CONTACT SHOULD BE COOLED WITH LARGE QUANTITIES OF WATER AS NEEDED TO PREVENT WEAKENING OF CONTAINER STRUCTURE.

SECTION IX REACTIVITY

STABILITY: STABLE

HAZARDOUS POLYMERIZATION: WILL NOT OCCUR

CONDITIONS AND MATERIALS TO AVOID:
AVOID HEAT, FLAME AND CONTACT WITH STRONG OXIDIZING AGENTS.

HAZARDOUS DECOMPOSITION PRODUCTS
CARBON MONOXIDE AND UNIDENTIFIED ORGANIC COMPOUNDS MAY BE FORMED DURING COMBUSTION.

SECTION X EMPLOYEE PROTECTION

RESPIRATORY PROTECTION
AVOID PROLONGED OR REPEATED BREATHING OF VAPORS. IF EXPOSURE MAY OR DOES EXCEED OCCUPATIONAL EXPOSURE LIMITS (SEC. IV) USE A NIOSH-APPROVED RESPIRATOR TO PREVENT OVEREXPOSURE. IN ACCORD WITH 29 CFR 1910.134 USE EITHER AN ATMOSPHERE-SUPPLYING RESPIRATOR OR AN AIR-PURIFYING RESPIRATOR FOR ORGANIC VAPORS.

PROTECTIVE CLOTHING
AVOID CONTACT WITH EYES. WEAR SAFETY GLASSES OR GOGGLES AS APPROPRIATE. AVOID PROLONGED OR REPEATED CONTACT WITH SKIN. WEAR CHEMICAL-RESISTANT GLOVES AND OTHER CLOTHING AS REQUIRED TO MINIMIZE CONTACT.

ITIONAL PROTECTIVE MEASURES
EXPLOSION-PROOF VENTILATION AS REQUIRED TO CONTROL VAPOR CONCENTRATIONS. AIR-DRY CONTAMINATED THING IN A WELL VENTILATED AREA, THEN LAUNDER BEFORE REUSING.

TION XI ENVIRONMENTAL PROTECTION

LL OR LEAK PROCEDURES
TION. COMBUSTIBLE. *** LARGE SPILLS *** ELIMINATE POTENTIAL SOURCES OF IGNITION. WEAR ROPRIATE RESPIRATOR AND OTHER PROTECTIVE CLOTHING. SHUT OFF SOURCE OF LEAK ONLY IF SAFE TO DO DIKE AND CONTAIN. REMOVE WITH VACUUM TRUCKS OR PUMP TO STORAGE/SALVAGE VESSELS. SOAK UP IDUE WITH AN ABSORBENT SUCH AS CLAY, SAND, OR OTHER SUITABLE MATERIAL; PLACE IN NON-LEAKING TAINERS AND SEAL TIGHTLY FOR PROPER DISPOSAL. FLUSH AREA WITH WATER TO REMOVE TRACE RESIDUE; POSE OF FLUSH SOLUTION AS ABOVE. *** SMALL SPILLS *** TAKE UP WITH AN ABSORBENT MATERIAL AND CE IN NON-LEAKING CONTAINERS FOR PROPER DISPOSAL.

TION XII SPECIAL PRECAUTIONS

P LIQUID AND VAPOR AWAY FROM HEAT, SPARKS AND FLAME. SURFACES THAT ARE SUFFICIENTLY HOT MAY ITE EVEN LIQUID PRODUCT IN THE ABSENCE OF SPARKS OR FLAME. EXTINGUISH PILOT LIGHTS, CIGARETTES TURN OFF OTHER SOURCES OF IGNITION PRIOR TO USE AND UNTIL ALL VAPORS ARE GONE. VAPORS MAY UMULATE AND TRAVEL TO IGNITION SOURCES DISTANT FROM THE HANDLING SITE; FLASH-FIRE CAN RESULT. P CONTAINERS CLOSED WHEN NOT IN USE. USE WITH ADEQUATE VENTILATION.

TAINERS, EVEN THOSE THAT HAVE BEEN EMPTIED, CAN CONTAIN EXPLOSIVE VAPORS. DO NOT CUT, DRILL, NO, WELD OR PERFORM SIMILAR OPERATIONS ON OR NEAR CONTAINERS.

TIC ELECTRICITY MAY ACCUMULATE AND CREATE A FIRE HAZARD. GROUND FIXED EQUIPMENT, BOND AND UND TRANSFER CONTAINERS AND EQUIPMENT.

TION XIII TRANSPORTATION REQUIREMENTS

RTMENT OF TRANSPORTATION CLASSIFICATION:
USTIBLE LIQUID

T. PROPER SHIPPING NAME:
OLEUM NAPHTHA

R REQUIREMENTS:
255., GUIDE SHEET 27.

TION XIV OTHER REGULATORY CONTROLS

ONENT #2 IS THE SUBJECT OF A TSCA SECTION 4 TEST RULE. EXPORT OF THIS PRODUCT IS THEREFORE IBITED WITHOUT NOTIFICATION TO EPA. THE COMPONENTS OF THIS PRODUCT ARE LISTED ON THE EPA/TSCA NTORY OF CHEMICAL SUBSTANCES.

ION XV SPECIAL NOTES

ION XI - ENVIRONMENTAL PROTECTION HAS BEEN REVISED. THE INFORMATION IN THE "WASTE DISPOSAL" "ENVIRONMENT PROTECTION" HAS BEEN REMOVED AND INCLUDED IN THE ATTACHED ENVIRONMENTAL DATA . IN ACCORDANCE WITH SARA TITLE III, SECTION 313, THE EOS SHOULD ALWAYS BE COPIED AND SENT THE MSDS.

Campbell or Henry Co. general if not one for Camp

Campbell Soup Company

NAPOLEON, OHIO 43545

October 30, 1991

Mr. Michael A. Porter
Division of Hazardous Waste Management
Northwest District Office
347 North Dunbridge Road
P.O. Box 466
Bowling Green, Ohio 43402

Dear Mr. Porter:

This letter is in response to your violation follow-up letter to me dated October 25, 1991.

Violation:

ORC3734.02 Waste oil mixed with rain water was standing along the outside of the waste oil above ground storage tank and dike.

Corrective action:

The above ground waste oil storage tank and pumping equipment was taken out of service on August 12, 1991. The tank and equipment was abandoned. Used oil is now transferred and pumped into our #3 boiler using a different system located inside an all-weather building attached to the Boilerhouse which eliminates the rain water problem.

Before the old upground storage tank area was abandoned, the C.H. Heist Corporation spent three days (August 12, 13, and 14) cleaning the area. They first vacuumed up all the standing water and oil. Then using their high pressure cleaning system they cleaned the inside and outside of the tank, and the concrete dike and roof. They then cleaned the concrete pads where the oily water was standing and the stones which made up the secondary dike. The oil collected by the Heist equipment was put on the coal pile and burned along with the coal as a fuel in #1 & #2 coal fired boilers.

If there are any questions concerning the above information, please call me at (419) 492-1010, extension 6343.

Sincerely,

CAMPBELL SOUP COMPANY

H. H. Salsbury, ~~Manager~~
Services & Utilities

Hazardous Waste
Henry County

October 25, 1991

Mr. Herbert H. Salsbury
Campbell Soup Company
P.O. Box 3011
Napoleon, Ohio 43545

Dear Mr. Salsbury:

As a result of Maryann Seghy's tour of your facility on August 5, 1991, your facility was found to be in violation of the following:

1. **ORC 3734.02** Campbell Soup Company illegally disposed of waste oil by allowing it to spill on the ground and mix with rain water.

2. **OAC 3745-52-11** Campbell Soup Company failed to properly evaluate an unlabeled 55 gallon drum of waste to determine if it is hazardous according to criteria set forth in chapter 3745-51 of the Ohio Administrative Code.

On September 15, 1991 this office received documentation consisting of analytical data which identified the contents of the drum referred to in violation #2 above. With this documentation, violation #2 has been corrected.

However, Campbell Soup Company has not responded to the issues raised in violation #1 of Maryann Seghy's Notice of Violation letter dated September 5, 1991.

Please respond to violation #1 in writing within ten (10) days. Your response must contain all actions and timetables necessary to demonstrate compliance.

Please be advised that continued noncompliance with applicable hazardous waste rules may be cause for enforcement action by this Agency pursuant to Chapter 3734 of the Ohio Revised Code.

If you have any questions, please advise.

Sincerely,

Michael A. Porter
Division of Hazardous
Waste Management

OHIO E.P.A.
N.W.D.O.

Ms. MaryAnn C. Sighy
Northwest District E.P.A.
347 North Dunbridge Road
P.O. Box 466
Bowling Green, Ohio 43402-0466

Dear Ms. Sighy:

This letter is in response to the violation letter we received from you dated September 5, 1991.

1. ORC3734.02. In order to be in compliance with the new B.I.F. regulations the Napoleon Campbell Soup plant made the decision that it would not burn enamel waste as a fuel in it's boilers effective August 20, 1991. On August 12, 1991 the pumping equipment for the outside enamel waste storage tank was removed along with the large manhole on the bottom of the tank. The Heist Cleaning Company used their high pressure cleaning system to clean the inside and outside of the tank and building. They also cleaned the concrete walls, pads, and stones, which made up the dike area. Using their large vacuum system they then vacuumed up all the removed oil and enamel, and put it on the coal pile where it was burned along with coal as a fuel in #1 and #2 coal fired boilers. The tank system is now unusable. When we decide to completely remove the tank system from our property, it will be done in accordance with the used tank removal regulations. Also, the soil around the tank will be evaluated and disposed of accordingly.

2. OAC 3745-52-11. The liquid waste we burned as a fuel in the boiler house came from the container manufacturing area. The enamel/solvent waste was delivered in square totes and the press room waste oil in 55 gallon drums. Since we plan to become a hazardous waste generator we had all of our waste sampled and evaluated by the Safety Kleen Company on July 19, 1991. Analysis of the container manufacturing press room waste oil which was in the 55 gallon drum in question is attached.

- continue -

3. I believe there is some confusion on our plans to burn waste oil and the small quantity on-site burner exemption. We plan to burn on-specification, non-regulated used oil in our #3 boiler. There is no gallonage limit on the burning of this oil as a fuel, because it does not fall under the hazardous waste regulations.

However, we have requested the small quantity on-site burner exemption. A copy of the letter to the U.S. E.P.A. requesting the exemption is attached. This will allow us to burn up to 140 gallons per month of certain types of hazardous waste. This is in addition to the non-regulated used oil that we will burn. We realize that both materials will have to be tested and records kept to be in compliance.

4. As discussed during your visit, due to the new B.I.F. regulations, the Napoleon Campbell Soup operation is becoming a generator of hazardous waste. A copy of the "Notification of Hazardous Waste Activity" sent to the U.S. E.P.A. is attached. We have had all our hazardous waste streams tested. We have been working with the Safety Kleen Company to insure a correct labeling, storage, and shipping program. On October 4, 1991, Safety Kleen will present a 4 bour in-plant hazardous waste handling workshop for our employees. On October 21 and 22 Mr. John Gerding, Team Leader-Container Manufacturing and Mr. Mike Maringer, Area Manger-Environmental Control, will attend a Lion Technology Hazardous Waste Management Workshop in Detroit. They will be assigned co-coordinators for the Napoleon hazardous waste activities.

If there are any question concerning the information in this letter, please call me at (419) 592-1010, extension 6343.

Sincerely,

CAMPBELL SOUP COMPANY

Re: Campbell Soup Company
OHD 005 419 171
Hazardous Waste
Henry County

September 5, 1991

Mr. Herbert H. Salsbury
Campbell Soup Company
P.O. Box 3011
Napoleon, Ohio 43545

Dear Mr. Salsbury:

This letter is to reply to questions raised during our August 5, 1991 meeting and subsequent phone conversation. The following concerns were raised.

1. During transfer of enamel paint, spills occur on the cement outside of the diked area above the underground storage tank. These spills are difficult to contain and clean. The Ohio EPA recommends the use of drip pans and that the transfer of paint take place within the dike. The Ohio EPA recommends removal of the gravel contained in the diked area. This gravel must be evaluated and disposed of accordingly.

2. During our meeting we discussed Campbell Soup Company's wish to distill onsite "O Thinner" and "Mineral Spirits". This process may be conducted; however, the resulting still bottoms must be handled as a hazardous waste if they exhibit any of the hazardous waste characteristics.

3. Campbell Soup Company plans to continue to burn waste oil. Questions were raised as to whether the company qualifies as an exempt small quantity burner. This exemption is addressed in the Federal Register, Vol. 56, No. 35, pp. 7189-7192. Art Coleman of the Ohio EPA summarized the exemption of small quantity burners in the following two paragraphs:

> *Facilities which burn small quantities of hazardous wastes on site are exempt from regulation if: (1) the instantaneous firing rate is limited to 1% of the total fuel burned, (2) the facility does not burn acutely hazardous waste containing dioxins (eg. F020,*

Printed on recycled paper

F021, F022, F023, F026, or F027), (3) the quantity of hazardous waste burned in a calendar month does not exceed terrain-adjusted effective stack height values (specified in the final rule table), (4) the unmixed hazardous waste is used to determine the 1% limit in "1", and (5) if more than one BIF is used to burn hazardous wastes on site, the quantity limits must be evaluated with reference to the formula specified in the final rule.

The owner/operator under the small quantity burner exemption is required to submit a one-time signed, written notice specifying that: (1) the combustion unit is operating as a small quantity burner of hazardous wastes, (2) that the owner/operator is complying with the provisions of the ruling, and (3) specify the maximum monthly quantity of hazardous wastes burned. In addition, the owner/operator must keep on file, for a period of three years, all information demonstrating compliance with the provisions of the ruling.

Specifically, Campbell Soup Company may burn 140 gallons/ month of used oil if the height of the boiler stack is 30.0 to 34.9 meters. The waste should be tested for total halogen content in order to determine dioxin content. If the total halogen content is less than 1000 ppm, the waste can be classified as used oil. If the total halogen content of the waste is between 1000 and 4000 ppm, the waste is classified as a hazardous waste unless the presumption can be rebutted. Used oil that contains more than 4000 ppm total halogens is unrebuttably classified as a hazardous waste.

4. Campbell Soup Company should have one EPA identification number. This number should be the same number as in the past, and describe all activities. When a change of status occurs, Campbell Soup Company must notify Ohio EPA and U.S. EPA via Ohio EPA. The contact is:

Thomas Crepeau, Manager
Data Management Section
Ohio EPA
P.O. Box 1049
Columbus, Ohio 43266-0149

The State of Ohio has not adopted many of the rules referred to in this letter. The U.S. EPA is responsible for enforcing the new boiler rules; therefore, future correspondence should be directed to the U.S. EPA Region V contact. The contact is:

Y.J. Kim
EPA Region V
230 South Dearborn Street
Chicago, IL 60604
(312) 353-2000

While touring the site the following violations were found.

1. **Ohio Revised Code (ORC) 3734.02** No person shall establish or operate a hazardous waste facility for the disposal of hazardous waste without a permit.

   Waste oil mixed with rain water was standing along the outside of the waste oil above ground storage tank and dike. When waste oil is transferred into the tank, spills occur outside of the cement dike. Although the area is covered by a roof, when it rains the spilled oil mixes with rain water. This situation constitutes illegal disposal. Campbell Soup Company must submit to the Ohio EPA within 15 days a plan describing steps to be taken to correct this problem.

2. **Ohio Administrative Code (OAC) 3745-52-11** Any person who produces a waste shall evaluate the waste to determine if it is hazardous in accordance with the criteria for hazardous waste set forth in Chapter 3745-51 of the Administrative Code. If the waste is determined to be hazardous, it must be managed properly.

   Specifically, a 55 gallon drum of unlabeled waste was located outside near the boiler. Campbell Soup Company must submit analytical records proving the content of the waste to the Ohio EPA within 15 days.

Please be advised that failure to comply with applicable hazardous waste rules may be cause for enforcement action by this Agency pursuant to Chapter 3734 of the Ohio Revised Code.

Please respond in writing to this Notice of Violation (NOV) within fifteen (15) days. Your response must include all actions and timetables necessary to demonstrate compliance.

Failure to list specific deficiencies in this communication does not relieve you from the responsibilities of complying with all applicable regulations.

If you have any questions, please advise.

Sincerely,

Maryann C. Seghy

pc: A & C Representative
NWDO File

Campbell SOUP Company

NAPOLEON, OHIO 43545

December 12, 1986

Mr. Richard Dreschel
Ohio EPA NW District Office
1035 Devlac Grove Drive
Bowling Green, OH 43402-4598

Dear Mr. Dreschel:

In reference to your letter dated November 7, I have included the following:

Item (A) - A copy of the sludge test results
Item (B) - A copy of the specification for #1 and #3 boilers for requirement verification
Item (C) - A copy of test results on the waste burned for energy recovery which includes the BTU/lb.
Item (D) - A copy of EPA re-notification on Hazardous Waste Activity

The test results on the impounded sludge you viewed on October 31, 1986 shows that it does not contain any hazardous amounts of heavy metals or solvents. However, it does have a 50°C flash point which is only 10°C below the minimum. In accordance with Section 265.312, we plan to mix this sludge with dirt so that it no longer meets the ignitability characteristics and then place in an approved landfill.

Also during the October visit, Mr. Paul Kalter strongly recommended the use of a solvent recovery system. Our plant has initiated a project for the installation of a new recovery system and plan to have it installed and operating during 1987.

If you have any questions about this report, please contact me at 592-1010 ext. 343.

Sincerely,

CAMPBELL SOUP COMPANY

H. H. Salsbury, Manager

Mr. Herbert Salsbury
Campbell Soup Company
Route 110 East
Napoleon, Ohio 43545

Dear Mr. Salsbury:

On October 31, 1986, Mr. Paul Kalter and I visited the Campbell Soup Company facility in Napoleon, Ohio. The purpose of this visit was to investigate an anonymous complaint concerning your handling of an enamel/solvent sludge from the can plant.

From our discussion it was understood that this solution of enamel and solvent is normally burned in your boiler for energy recovery. However, on the occasion in question, two different enamels were mixed, causing them to gel. After removing the free liquid, mainly solvents, the gel was cleaned from the holding tank using large amounts of water. The material removed from the tank was then taken to two temporary surface impoundments on the property. This cleaning operation was conducted by Heist Cleaning.

As we discussed on October 31, 1986, this may constitute improper disposal of a hazardous waste. Pending the results of sampling to be initiated by the Campbell Soup Company, no further action on this matter is warranted at this time. The samples should be tested for flash point, solvent, and metals content. A legible copy of the results should be forwarded to me at the OEPA in Bowling Green.

Your practice of burning the solvent/enamel waste for energy recovery purposes appears to be an acceptable practice at this time. You are regulated under Part 266 Subpart D (enclosed for your review). Please note that you must re-notify the U.S. EPA to identify your hazardous waste fuel activities (form enclosed).

Please send this office verification that the boiler meets the requirements of CFR Section 260.10 (enclosed) and notify us of the BTU value of all wastes burned for energy recovery. If this value is below 8000 BTU/lb for any waste going to the boiler, you will be regulated under Section 265 Subpart O because this will constitute destruction and not burning as a fuel.

Pleae feel free to contact me at 352-8461 if you have any questions or if I can be of any further help.

Sincerely,

Richard Dreschel
District Engineer

Mr. Gerald Rich
Ohio Environmental Protection Agency
Northwest District Office
1035 Delvac Grove Drive
Bowling Green, Ohio 43402

Dear Mr. Rich:

In 1975, due to the gas shortage, the Napoleon Plant was looking for alternate energy sources. During this study we discovered that we were throwing away a lot of spent enamel waste that had a good BTU valve, so a program was developed to burn it in our boilers as a fuel. At first we encountered some problems when mixing oil base and water base enamels together before burning so we developed a separate spray burner for each. The oil base enamel waste is burned along with our #6 oil in boiler B003. On the average we will burn 100 - 200 gallons a day of oil base enamel waste with 15,000 gallons of #6 oil. Our water base enamel waste is burned along with coal in boiler B002. On the average we burn 50 - 100 gallons a day of water base enamel waste along with 84 tons of coal.

Since our enamel waste had a BTU value and was being used as a fuel in our large industrial boilers the waste was not considered hazardous under the R.C.R.A. regulations which became law in 1980.

In 1986, Mr. Paul Kalter and Mr. Richard Dreschel, from the Ohio E.P.A., visited our plant to investigate an anonymous complaint. I have included copies of our correspondence because it verifies the fact that the E.P.A. knows we are using the enamel waste as a fuel and it includes test data along with a copy of the E.P.A. re-notification on hazardous waste activity.

- continue -

However, my present boiler permits due not include any language covering these waste activities. We are requesting that this data becomes part of permits B002 and B003.

Sincerely,

CAMPBELL SOUP COMPANY

Herbert H. Salsbury
Manager, Services & Utilities

dr

A portion of the material was analyzed by gas chromatography for solvent content. A complex spectra resembling paint solvents was found to be present, but is a concentration of less than 1 percent. Without analysis by mass spectrometry, we cannot positively identify each component of the material.

Based on the above results, the sludge is a hazardous waste on the basis of ignitability (the flash point is too low).

If you have any questions, please feel free to contact us.

Very truly yours,

RE: WASTE SLUDGE ANALYSIS
E.C.I. JOB NUMBER 354

Dear Mr. Downham:

On November 11, 1986, our laboratory received one (1) waste sludge from your firm for analysis. The purpose of the analysis was to determine if the sludge would be considered a hazardous waste as defined in 40 CFR Part 261 "Identification and Listing of Hazardous Waste". The sample was analyzed in accordance with SW-846 "Test Methods for Evaluating Solid Waste".

The results of the analysis were as follows:

PARAMETER	CONCENTRATION (mg/l)	MAXIMUM ALLOWABLE LIMITS (mg/l)
Arsenic	< 0.01	5.0
Cadmium	< 0.01	1.0
Chromium	< 0.01	5.0
Barium	3.5	100.0
Lead	< 0.1	5.0
Mercury	0.001	0.2
Selenium	< 0.01	1.0
Silver	< 0.02	5.0
pH	7.23	≤2 or ≥12.5
Flash point	50°C	60°C minimum

Campbell Soup Company

CAMDEN, NEW JERSEY 08101

November 18, 1982

Mr. Karl J. Klecatsky, Jr., Chief
Waste Management Branch
United States Environmental
Protection Agency
Region V
111 West Jackson Blvd.
Chicago, Illinois 60604

Dear Mr. Klecatsky:

Re: Campbell Soup Company, Napoleon, Ohio Plant, I.D. No. OHD004191171

Thank you for your letter and attachments of October 7, 1982, acknowledging receipt of our letter of September 7, 1982, which withdrew our Interim Status Hazardous Waste Permit Application for the above facility.

As again stated, withdrawal of our Part A Hazardous Waste Permit Application, as we have previously indicated, was simply because the application was merely "protective" or precautionary in nature. After carefully reviewing our application, we determined that since November 19, 1980, we did not at any time treat, store for 90 days or more, or dispose of hazardous waste at the above facility, nor have we treated, stored, or disposed of hazardous waste subsequently. Put another way, insofar as the above facility is concerned, we have not at any time since November 19, 1980 to date been the "owner" or "operator" of a "hazardous waste treatment, storage, or disposal facility", as set forth in 40 C.F.R., Part 265.

Accordingly, we respectfully again request to withdraw our permit application and respectfully submit that the filing of a closure plan with our withdrawal request is not required, and that other corrective post-closure provisions are also inapplicable.

Very

For your information, and as previously indicated by us, we determined last year that of the two mixtures indicated on our permit application, one mixture (described by us as F017) in fact was erroneously identified by us as F017. This mixture was not, and has not at any time been, either F017 or any other listed or unlisted hazardous waste. Rather, it is an aqueous solution, with no or almost no alcohol content, and does not meet the characteristics of hazardous waste as defined in Part 261, Subpart C, of the U.S. Environmental Protection Agency's regulations issued pursuant to the Federal Resource Conservation and Recovery Act. The other mixture indicated by us on our permit application, F001, has a heat value of over 12,000 BTU's per gallon, has been beneficially used by us as a fuel supplement in our on-site boilers since 1978, continues to have beneficial use, and, it is submitted, therefore falls within the special provisions of 40 C.F.R., Section 261.6(a) for mixtures which are being beneficially used or reused or legitimately recycled or reclaimed. (In addition, this mixture is not a sludge, is not a listed hazardous waste, was not produced by mixing a listed with a non-listed waste, and therefore does not contain a listed hazardous waste, and therefore does not fall within 40 C.F.R., Section 261.3(a).)

Very truly yours,

CAMPBELL SOUP COMPANY

Napoleon, Ohio 43545

Attn: H.H. Salsbury

Dear Mr. Salsbury:

The Hazardous Waste Facility Approval Board is in receipt of your July 13, 1981 letter stating withdrawal of your application for a Hazardous Waste Facility Installation and Operation Permit. Your application has subsequently been placed in an inactive file.

This action was taken pursuant to your letter but without review of the requirements set forth in Chapter 3734 of the Revised Code or the Hazardous Waste Rules. This action does not constitute an approval of your statement that the above referenced facility does not require a permit to treat, store and/or dispose of hazardous waste.

This matter has been referred to the Office of Hazardous Materials Management, Ohio EPA, for its review. If it is determined that the facility is required to obtain a Hazardous Waste Facility Installation and Operation Permit, that Office will contact you and provide any necessary information.

Sincerely,

Peggy Vince

Peggy Vince,
Coordinator, Hazardous
Waste Facility Approval Board

Gentlemen:

RE: EPA ID #OHD005419171

On November 19, 1980, Campbell Soup Company, located at Napoleon, Ohio, forwarded to your office a completed Hazardous Waste Permit Application. This was a precautionary or protective notification because we were uncertain whether or not the two mixtures we listed as F017 and D001 were subject to all regulations issued pursuant to the federal Resource Conservation and Recovery Act (RCRA). We have now determined that under the present regulations, including RCRA regulations Section 261.6, we are neither subject to the regulations affecting generators of hazardous waste nor to those affecting treatment, storage, or disposal facilities. We hereby request withdrawal of our RCRA Part A application filed November 19, 1980.

More specifically, as discussed in our April 7, 1981, letter to the Ohio EPA, copy attached, we have now determined that the mixture we listed as F017 in fact is neither F017 nor a listed or unlisted hazardous waste. (We also note that F017 has been at least temporarily delisted.) Moreover, the mixture we listed as D001 on our application has a heat value of over 132,000 BTU's per gallon, has been beneficially used by us on-site as a fuel supplement in our boilers for the last three years, and continues to be so beneficially used. Accordingly, pursuant to RCRA regulations, Section 261.6(a), this mixture is not subject to RCRA regulations, Parts 262-5, Parts 122-124, or RCRA, Section 3010.

Sincerely,

CAMPBELL SOUP COMPANY

H. H. Salsbury, Manager
Services & Utilities

Columbus, OH 43216

Gentlemen:

Pursuant to your request, enclosed please find a copy of the U.S. Environmental Protection Agency Hazardous Waste Application, Part A, filed by this plant November 19, 1980, as part of its obtaining and maintaining "interim status" as a treatment, storage, or disposal facility. As you will note, that Application referred to F017 as a hazardous waste in our plant.

However, we have now determined that the mixture we referred to as F017 on our Application is neither a listed nor unlisted hazardous waste, as defined by the Environmental Protection Agency's regulations issued pursuant to the federal Resource Conservation and Recovery Act, for the following reasons:

a. The Environmental Protection Agency has at least temporarily suspended F017 as a listed hazardous waste (January 16, 1981, Federal Register).
b. Although we referred to our mixture as F017 on our Application in an excess of caution, we have now determined, based on further knowledge of our own mixture, that our mixture in fact did and does not come within the definition of F017.
c. The mixture we referred to as F017 is an aqueous solution, with no or almost no alcohol content, and does not meet the characteristics of hazardous waste as defined in Part 261, Subpart C, of the Environmental Protection Agency's regulations issued pursuant to the federal Resource Conservation and Recovery Act.

'81 APR 22 PM 12

If there are any questions concerning this application, please call me at (419) 592-1010 ext. 343.

Sincerely,

CAMPBELL SOUP COMPANY

PLEASE PLACE LABEL IN THIS SPACE

GENERAL INSTRUCTIONS

If a preprinted label has been provided, affix it in the designated space. Review the information carefully; if any of it is incorrect, cross through it and enter the correct data in the appropriate fill-in area below. Also, if any of the preprinted data is absent (the area to the left of the label space lists the information that should appear), please provide it in the proper fill-in area(s) below. If the label is complete and correct, you need not complete Items I, III, V, and VI (except VI-B which must be completed regardless). Complete all items if no label has been provided. Refer to the instructions for detailed item descriptions and for the legal authorizations under which this data is collected.

II. POLLUTANT CHARACTERISTICS

INSTRUCTIONS: Complete A through J to determine whether you need to submit any permit application forms to the EPA. If you answer "yes" to any questions, you must submit this form and the supplemental form listed in the parenthesis following the question. Mark "X" in the box in the third column if the supplemental form is attached. If you answer "no" to each question, you need not submit any of these forms. You may answer "no" if your activity is excluded from permit requirements; see Section C of the instructions. See also, Section D of the instructions for definitions of bold-faced terms.

SPECIFIC QUESTIONS	MARK 'X' YES	NO	FORM ATTACHED
A. Is this facility a publicly owned treatment works which results in a discharge to waters of the U.S.? (FORM 2A)		X	
B. Does or will this facility (either existing or proposed) include a concentrated animal feeding operation or aquatic animal production facility which results in a discharge to waters of the U.S.? (FORM 2B)		X	
C. Is this a facility which currently results in discharges to waters of the U.S. other than those described in A or B above? (FORM 2C)	X		
D. Is this a proposed facility (other than those described in A or B above) which will result in a discharge to waters of the U.S.? (FORM 2D)		X	
E. Does or will this facility treat, store, or dispose of hazardous wastes? (FORM 3)	X		X
F. Do you or will you inject at this facility industrial or municipal effluent below the lowermost stratum containing, within one quarter mile of the well bore, underground sources of drinking water? (FORM 4)			X
G. Do you or will you inject at this facility any produced water or other fluids which are brought to the surface in connection with conventional oil or natural gas production, inject fluids used for enhanced recovery of oil or natural gas, or inject fluids for storage of liquid hydrocarbons? (FORM 4)		X	
H. Do you or will you inject at this facility fluids for special processes such as mining of sulfur by the Frasch process, solution mining of minerals, in situ combustion of fossil fuel, or recovery of geothermal energy? (FORM 4)			X
I. Is this facility a proposed stationary source which is one of the 28 industrial categories listed in the instructions and which will potentially emit 100 tons per year of any air pollutant regulated under the Clean Air Act and may affect or be located in an attainment area? (FORM 5)		X	
J. Is this facility a proposed stationary source which is NOT one of the 28 industrial categories listed in the instructions and which will potentially emit 250 tons per year of any air pollutant regulated under the Clean Air Act and may affect or be located in an attainment area? (FORM 5)		X

B. REVISED APPLICATION *(place an "X" below and complete Item I above)*

[ ] 1. FACILITY HAS INTERIM STATUS

[ ] 2. FACILITY HAS A RCRA PERMIT

III. PROCESSES – CODES AND DESIGN CAPACITIES

A. PROCESS CODE – Enter the code from the list of process codes below that best describes each process to be used at the facility. Ten lines are provided for entering codes. If more lines are needed, enter the code(s) in the space provided. If a process will be used that is not included in the list of codes below, then describe the process *(including its design capacity)* in the space provided on the form *(Item III-C)*.

B. PROCESS DESIGN CAPACITY – For each code entered in column A enter the capacity of the process.

1. AMOUNT – Enter the amount.
2. UNIT OF MEASURE – For each amount entered in column B(1), enter the code from the list of unit measure codes below that describes the unit of measure used. Only the units of measure that are listed below should be used.

PROCESS	PROCESS CODE	APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY
Storage:		
CONTAINER *(barrel, drum, etc.)*	S01	GALLONS OR LITERS
TANK	S02	GALLONS OR LITERS
WASTE PILE	S03	CUBIC YARDS OR CUBIC METERS
SURFACE IMPOUNDMENT	S04	GALLONS OR LITERS
Disposal:		
INJECTION WELL	D79	GALLONS OR LITERS
LANDFILL	D80	ACRE-FEET *(the volume that would cover one acre to a depth of one foot)* OR HECTARE-METER
LAND APPLICATION	D81	ACRES OR HECTARES
OCEAN DISPOSAL	D82	GALLONS PER DAY OR LITERS PER DAY
SURFACE IMPOUNMENT	D83	GALLONS OR LITERS
Treatment:		
TANK	T01	GALLONS PER DAY OR LITERS PER DAY
SURFACE IMPOUNMENT	T02	GALLONS PER DAY OR LITERS PER DAY
INCINERATOR	T03	TONS PER HOUR OR METRIC TONS PER HOUR; GALLONS PER HOUR OR LITERS PER HOUR
OTHER *(Use for physical, chemical, thermal or biological treatment processes not occurring in tanks, surface impoundments or incinerators. Describe the processes in the space provided; Item III-C.)*	T04	GALLONS PER DAY OR LITERS PER DAY

UNIT OF MEASURE	UNIT OF MEASURE CODE

19					
20					
21					
22					
23					
24					
25					
26					

Continued from the front.

III. PROCESSES *(continued)*

C. SPACE FOR ADDITIONAL PROCESS CODES OR FOR DESCRIBING OTHER PROCESSES *(code "T04")*. FOR EACH PROCESS ENTERED HERE INCLUDE DESIGN CAPACITY.

T04 - USED AS A FUEL TO SUPPLEMENT THE #6 OIL USED IN THE COMPANY'S #3 BOILER.

IV. DESCRIPTION OF HAZARDOUS WASTES

A. EPA HAZARDOUS WASTE NUMBER – Enter the four–digit number from 40 CFR, Subpart D for each listed hazardous waste you will handle. If you handle hazardous wastes which are not listed in 40 CFR, Subpart D, enter the four–digit number*(s)* from 40 CFR, Subpart C that describes the characteristics and/or the toxic contaminants of those hazardous wastes.

B. ESTIMATED ANNUAL QUANTITY – For each listed waste entered in column A estimate the quantity of that waste that will be handled on an annual basis. For each characteristic or toxic contaminant entered in column A estimate the total annual quantity of all the non–listed waste*(s)* that will be handled which possess that characteristic or contaminant.

C. UNIT OF MEASURE – For each quantity entered in column B enter the unit of measure code. Units of measure which must be used and the appropriate codes are:

ENGLISH UNIT OF MEASURE	CODE	METRIC UNIT OF MEASURE	CODE
POUNDS	P	KILOGRAMS	K
TONS	T	METRIC TONS	M

If facility records use any other unit of measure for quantity, the units of measure must be converted into one of the required units of measure taking into account the appropriate density or specific gravity of the waste.

D. PROCESSES

1. PROCESS CODES:
   For listed hazardous waste: For each listed hazardous waste entered in column A select the code*(s)* from the list of process codes contained in Item III to indicate how the waste will be stored, treated, and/or disposed of at the facility.
   For non–listed hazardous wastes: For each characteristic or toxic contaminant entered in column A, select the code*(s)* from the list of process codes contained in Item III to indicate all the processes that will be used to store, treat, and/or dispose of all the non–listed hazardous wastes that possess that characteristic or toxic contaminant.
   Note: Four spaces are provided for entering process codes. If more are needed: (1) Enter the first three as described above; (2) Enter "000" in the extreme right box of Item IV-D(1); and (3) Enter in the space provided on page 4, the line number and the additional code*(s)*.

2. PROCESS DESCRIPTION: If a code is not listed for a process that will be used, describe the process in the space provided on the form.

NOTE: HAZARDOUS WASTES DESCRIBED BY MORE THAN ONE EPA HAZARDOUS WASTE NUMBER – Hazardous wastes that can be described by more than one EPA Hazardous Waste Number shall be described on the form as follows:

1. Select one of the EPA Hazardous Waste Numbers and enter it in column A. On the same line complete columns B,C, and D by estimating the total annual quantity of the waste and describing all the processes to be used to treat, store, and/or dispose of the waste.
2. In column A of the next line enter the other EPA Hazardous Waste Number that can be used to describe the waste. In column D(2) on that line enter "included with above" and make no other entries on that line.
3. Repeat step 2 for each other EPA Hazardous Waste Number that can be used to describe the hazardous waste.

EXAMPLE FOR COMPLETING ITEM IV *(shown in line numbers X-1, X-2, X-3, and X-4 below)* – A facility will treat and dispose of an estimated 900 pounds per year of chrome shavings from leather tanning and finishing operation. In addition, the facility will treat and dispose of three non–listed wastes. Two wastes are corrosive only and there will be an estimated 200 pounds per year of each waste. The other waste is corrosive and ignitable and there will be an estimated 100 pounds per year of that waste. Treatment will be in an incinerator and disposal will be in a landfill.

LINE NO.	A. EPA HAZARD. WASTE NO. (enter code)	B. ESTIMATED ANNUAL QUANTITY OF WASTE	C. UNIT OF MEASURE (enter code)	D. PROCESSES 1. PROCESS CODES (enter)	D. PROCESSES 2. PROCESS DESCRIPTION (if a code is not entered in D(1))
X-1	K 0 5 4	900	P	T 0 3 D 8 0	
X-2	D 0 0 2	400	P	T 0 3 D 8 0	
X-3	D 0 0 1	100	P	T 0 3 D 8 0	
X-4	D 0 0 2				included with above

Continued from the front.

N. W. D. O.

Mr. Richard Dreschel
Ohio EPA NW District Office
1035 Devlac Grove Drive
Bowling Green, OH 43402-4598

Dear Mr. Dreschel:

In reference to your letter dated November 7, I have included the following:

Item (A) - A copy of the sludge test results
Item (B) - A copy of the specification for #1 and #3 boilers for requirement verification
Item (C) - A copy of test results on the waste burned for energy recovery which includes the BTU/lb.
Item (D) - A copy of EPA re-notification on Hazardous Waste Activity

The test results on the impounded sludge you viewed on October 31, 1986 shows that it does not contain any hazardous amounts of heavy metals or solvents. However, it does have a 50°C flash point which is only 10°C below the minimum. In accordance with Section 265.312, we plan to mix this sludge with dirt so that it no longer meets the ignitability characteristics and then place in an approved landfill.

Also during the October visit, Mr. Paul Kalter strongly recommended the use of a solvent recovery system. Our plant has initiated a project for the installation of a new recovery system and plan to have it installed and operating during 1987.

If you have any questions about this report, please contact me at 592-1010 ext. 343.

Sincerely,

CAMPBELL SOUP COMPANY

RE: WASTE SLUDGE ANALYSIS
E.C.I. JOB NUMBER 354

Dear Mr. Downham:

On November 11, 1986, our laboratory received one (1) waste sludge from your firm for analysis. The purpose of the analysis was to determine if the sludge would be considered a hazardous waste as defined in 40 CFR Part 261 "Identification and Listing of Hazardous Waste". The sample was analyzed in accordance with SW-846 "Test Methods for Evaluating Solid Waste".

The results of the analysis were as follows:

PARAMETER	CONCENTRATION (mg/l)	MAXIMUM ALLOWABLE LIMITS (mg/l)
Arsenic	< 0.01	5.0
Cadmium	< 0.01	1.0
Chromium	< 0.01	5.0
Barium	3.5	100.0
Lead	< 0.1	5.0
Mercury	0.001	0.2
Selenium	< 0.01	1.0
Silver	< 0.02	5.0
pH	7.23	≤2 or ≥12.5
Flash point	50°C	60°C minimum

1810 N. 12th Street P. O. Box 2104
Toledo, Ohio 43603
(419) 241-7127

A portion of the material was analyzed by gas chromatography for solvent content. A complex spectra resembling paint solvents was found to be present, but is a concentration of less than 1 percent. Without analysis by mass spectrometry, we cannot positively identify each component of the material.

Based on the above results, the sludge is a hazardous waste on the basis of ignitability (the flash point is too low).

If you have any questions, please feel free to contact us.

Very truly yours,

ENVIRONMENTAL CONSULTANTS, INC.

Columbus, OH 43216

Gentlemen:

Pursuant to your request, enclosed please find a copy of the U.S. Environmental Protection Agency Hazardous Waste Application, Part A, filed by this plant November 19, 1980, as part of its obtaining and maintaining "interim status" as a treatment, storage, or disposal facility. As you will note, that Application referred to F017 as a hazardous waste in our plant.

However, we have now determined that the mixture we referred to as F017 on our Application is neither a listed nor unlisted hazardous waste, as defined by the Environmental Protection Agency's regulations issued pursuant to the federal Resource Conservation and Recovery Act, for the following reasons:

a. The Environmental Protection Agency has at least temporarily suspended F017 as a listed hazardous waste (January 16, 1981, Federal Register).
b. Although we referred to our mixture as F017 on our Application in an excess of caution, we have now determined, based on further knowledge of our own mixture, that our mixture in fact did and does not come within the definition of F017.
c. The mixture we referred to as F017 is an aqueous solution, with no or almost no alcohol content, and does not meet the characteristics of hazardous waste as defined in Part 261, Subpart C, of the Environmental Protection Agency's regulations issued pursuant to the federal Resource Conservation and Recovery Act.

If there are any questions concerning this application, please call me at (419) 592-1010 ext. 343.

Sincerely,

CAMPBELL SOUP COMPANY

July 13, 1981

RCRA Activities
P.O. Box 7861
Chicago, Illinois 60680

Gentlemen:

RE: EPA ID #OHD005419171

On November 19, 1980, Campbell Soup Company, located at Napoleon, Ohio, forwarded to your office a completed Hazardous Waste Permit Application. This was a precautionary or protective notification because we were uncertain whether or not the two mixtures we listed as F017 and D001 were subject to all regulations issued pursuant to the federal Resource Conservation and Recovery Act (RCRA). We have now determined that under the present regulations, including RCRA regulations Section 261.6, we are neither subject to the regulations affecting generators of hazardous waste nor to those affecting treatment, storage, or disposal facilities. We hereby request withdrawal of our RCRA Part A application filed November 19, 1980.

More specifically, as discussed in our April 7, 1981, letter to the Ohio EPA, copy attached, we have now determined that the mixture we listed as F017 in fact is neither F017 nor a listed or unlisted hazardous waste. (We also note that F017 has been at least temporarily delisted.) Moreover, the mixture we listed as D001 on our application has a heat value of over 132,000 BTU's per gallon, has been beneficially used by us on-site as a fuel supplement in our boilers for the last three years, and continues to be so beneficially used. Accordingly, pursuant to RCRA regulations, Section 261.6(a), this mixture is not subject to RCRA regulations, Parts 262-5, Parts 122-124, or RCRA, Section 3010.

Sincerely,

CAMPBELL SOUP COMPANY

H. H. Salsbury, Manager
Services & Utilities

Re: OAC Chapter 3745
Senate Bill 269
Hazardous Waste Facility Permits

Campbell Soup Company
Attn: Herbert Salsbury
Route 110 East
Napoleon, OH 43545

July 15, 1981

Dear Mr. Salsbury:

The Ohio EPA is currently in the process of carrying out the provisions of Senate Bill 269 which pertains to issuance of State permits for hazardous waste treatment, storage, or disposal facilities (TSDF's). Ohio EPA personnel will be conducting TSDF inspections to insure compliance with Chapter 3745-50-- 3745-58 of the Ohio Administrative Code. These inspections are based on the Interim Status Standards found in the May 19, 1980 Federal Register which Ohio has adopted and referenced by OAC numbers. The applicable sections of these regulations, identified by both State and Federal Code numbers, are listed below:

Section	Description	Location
40 CFR, Part 262 3745-52-10(A)	Standards for generators of hazardous waste - Manifest requirements - Pre-Transport Requirements - Recordkeeping and reporting	pp. 33142 thru 33147 pp. 97 thru 121(B)
40 CFR, Part 265 3745-55...58	INTERIM STATUS STANDARDS for owners and operators of hazardous waste treatment, storage and disposal facilities	pp. 33232 thru 33258 pp. 228 thru 450
Subpart B 55-10...17	General Facility Standards	pp. 33233 thru 33236 pp. 232 thru 251

Note: Short-term storage for 90 days or less in tanks and containers also requires that regulations in Section 265, Subparts C & D, (OAC 3745-55-30... 3745-55-56) (Preparedness and Prevention plus Contingency and Emergency) be met.

Subpart M 57-50...62	Land Treatment	pp. 33247 thru 33249 pp. 372 thru 390
Subpart N 57-70...85	Landfills	pp. 33249 thru 33251 pp. 391-402
Subpart Q 58-50...56	Chemical, Physical and Biological Treatment	pp. 33251 thru 33252 pp. 418 thru 426
Subpart R 58-70	Underground Injection	pp. 33252 p. 427

Note: Numerous Amendments to these regulations have been promulgated. Please contact the Ohio EPA, Northwest District Office (419-352-8461) for further information, Attn: Tom Wray.

I recognize that this information is repetitious for many; however, it is included here for those who are not familiar with these regulations and the subsequent Amendments.

As mentioned earlier, the Ohio EPA is conducting inspections of those facilities engaged in the generation, transportation, storage, or disposal of hazardous waste. Your company has identified itself as a TSDF. Therefore, an inspection has been tentatively scheduled sometime during the next two months. You will be contacted by telephone approximately a week prior to the inspection to arrange a definite meeting date.

For your benefit, I suggest you ensure your facility is in compliance with the applicable portions of these regulations as non-compliance will result in a notice of violation and a possible fine.

Sincerely,

Thomas K. Wray
Hazardous Waste Scientist

GENERAL INSTRUCTIONS

If a preprinted label has been provided, affix it in the designated space. Review the information carefully; if any of it is incorrect, cross through it and enter the correct data in the appropriate area below. Also, if any of the preprinted data is absent (*the area to the left of the label space lists the information that should appear*), please provide it in the proper fill-in area(s) below. If the label is complete and correct, you need not complete Items I, III, V, and VI (*except VI-B which must be completed regardless*). Complete all items if no label has been provided. Refer to the instructions for detailed item descriptions and for the legal authorizations under which this data is collected.

(specify)	(specify)

VIII. OPERATOR INFORMATION

A. NAME

CAMPBELL SOUP COMPANY

B. Is the name listed in Item VIII-A also the owner? ☒ YES ☐ NO

C. STATUS OF OPERATOR (Enter the appropriate letter into the answer box; if "Other", specify.)

F = FEDERAL; S = STATE; P = PRIVATE; M = PUBLIC (other than federal or state); O = OTHER (specify)

P (specify)

D. PHONE (area code & no.)

A 419 592 1010

E. STREET OR P.O. BOX

ROUTE 110 EAST

F. CITY OR TOWN

NAPOLEON

G. STATE OH **H. ZIP CODE** 43545

IX. INDIAN LAND

Is the facility located on Indian lands? ☐ YES ☒ NO

X. EXISTING ENVIRONMENTAL PERMITS

A. NPDES (Discharges to Surface Water): N OH0021AD

B. UIC (Underground Injection of Fluids): U

C. RCRA (Hazardous Wastes): X R

D. PSD (Air Emissions from Proposed Sources): D P

E. OTHER (specify): 9

E. OTHER (specify): 9

(specify) See Attachment 1

(specify)

XI. MAP

Attach to this application a topographic map of the area extending to at least one mile beyond property boundaries. The map must show the outline of the facility, the location of each of its existing and proposed intake and discharge structures, each of its hazardous waste treatment, storage, or disposal facilities, and each well where it injects fluids underground. Include all springs, rivers and other surface water bodies in the map area. See instructions for precise requirements.

XII. NATURE OF BUSINESS (provide a brief description)

THE NAPOLEON CAMPBELL SOUP PLANT PRODUCES A COMPLETE LINE OF HEAT PROCESSED SOUPS ALONG WITH SEVERAL TYPES OF VEGETABLE JUICES. THE PLANT ALSO HAS ITS OWN CONTAINER MANUFACTURING DEPARTMENT WHERE IT PRODUCES THE METAL CANS FOR ALL THE DIFFERENT PRODUCTS.

XIII. CERTIFICATION (see instructions)

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this application and all attachments and that, based on my inquiry of those persons immediately responsible for obtaining the information contained in the application, I believe that the information is true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

APPLICATION APPROVED	DATE RECEIVED (yr., mo., & day)

COMMENTS

II. FIRST OR REVISED APPLICATION

Place an "X" in the appropriate box in A or B below *(mark one box only)* to indicate whether this is the first application you are submitting for your facility or a revised application. If this is your first application and you already know your facility's EPA I.D. Number, or if this is a revised application, enter your facility's EPA I.D. Number in Item I above.

A. FIRST APPLICATION *(place an "X" below and provide the appropriate date)*

[X] 1. EXISTING FACILITY *(See instructions for definition of "existing" facility. Complete item below.)*

FOR EXISTING FACILITIES, PROVIDE THE DATE *(yr., mo., & day)* OPERATION BEGAN OR THE DATE CONSTRUCTION COMMENCED *(use the boxes to the left)*

YR.	MO.	DAY
5 7	0 8	0 1

[ ] 2. NEW FACILITY *(Complete item below.)*

FOR NEW FACILITIES, PROVIDE THE DATE *(yr., mo., & day)* OPERATION BEGAN OR IS EXPECTED TO BEGIN

YR.	MO.	DAY

B. REVISED APPLICATION *(place an "X" below and complete Item I above)*

[ ] 1. FACILITY HAS INTERIM STATUS

[ ] 2. FACILITY HAS A RCRA PERMIT

III. PROCESSES – CODES AND DESIGN CAPACITIES

A. PROCESS CODE – Enter the code from the list of process codes below that best describes each process to be used at the facility. Ten lines are provided for entering codes. If more lines are needed, enter the code(s) in the space provided. If a process will be used that is not included in the list of codes below, then describe the process *(including its design capacity)* in the space provided on the form *(Item III-C)*.

B. PROCESS DESIGN CAPACITY – For each code entered in column A enter the capacity of the process.

1. AMOUNT – Enter the amount.
2. UNIT OF MEASURE – For each amount entered in column B(1), enter the code from the list of unit measure codes below that describes the unit of measure used. Only the units of measure that are listed below should be used.

PROCESS	PROCESS CODE	APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY
Storage:		
CONTAINER *(barrel, drum, etc.)*	S01	GALLONS OR LITERS
TANK	S02	GALLONS OR LITERS
WASTE PILE	S03	CUBIC YARDS OR CUBIC METERS
SURFACE IMPOUNDMENT	S04	GALLONS OR LITERS
Disposal:		
INJECTION WELL	D79	GALLONS OR LITERS
LANDFILL	D80	ACRE-FEET *(the volume that would cover one acre to a depth of one foot)* OR HECTARE-METER
LAND APPLICATION	D81	ACRES OR HECTARES
OCEAN DISPOSAL	D82	GALLONS PER DAY OR LITERS PER DAY
SURFACE IMPOUNDMENT	D83	GALLONS OR LITERS

PROCESS	PROCESS CODE	APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY
Treatment:		
TANK	T01	GALLONS PER DAY OR LITERS PER DAY
SURFACE IMPOUNDMENT	T02	GALLONS PER DAY OR LITERS PER DAY
INCINERATOR	T03	TONS PER HOUR OR METRIC TONS PER HOUR OR GALLONS PER HOUR OR LITERS PER HOUR
OTHER *(Use for physical, chemical, thermal or biological treatment processes not occurring in tanks, surface impoundments or incinerators. Describe the processes in the space provided; Item III-C.)*	T04	GALLONS PER DAY OR LITERS PER DAY

UNIT OF MEASURE	UNIT OF MEASURE CODE
GALLONS	G
LITERS	L
CUBIC YARDS	Y
CUBIC METERS	C
GALLONS PER DAY	U

UNIT OF MEASURE	UNIT OF MEASURE CODE
LITERS PER DAY	V
TONS PER HOUR	D
METRIC TONS PER HOUR	W
GALLONS PER HOUR	E
LITERS PER HOUR	H

UNIT OF MEASURE	UNIT OF MEASURE CODE
ACRE-FEET	A
HECTARE-METER	F
ACRES	B
HECTARES	Q

EXAMPLE FOR COMPLETING ITEM III *(shown in line numbers X-1 and X-2 below)*: A facility has two storage tanks, one tank can hold 200 gallons and the other can hold 400 gallons. The facility also has an incinerator that can burn up to 20 gallons per hour.

T04 - USED AS A FUEL TO SUPPLEMENT THE #6 OIL USED IN THE COMPANY'S

#3 BOILER.

IV. DESCRIPTION OF HAZARDOUS WASTES

A. EPA HAZARDOUS WASTE NUMBER – Enter the four–digit number from 40 CFR, Subpart D for each listed hazardous waste you will handle. If you handle hazardous wastes which are not listed in 40 CFR, Subpart D, enter the four–digit number(s) from 40 CFR, Subpart C that describes the characteristics and/or the toxic contaminants of those hazardous wastes.

B. ESTIMATED ANNUAL QUANTITY – For each listed waste entered in column A estimate the quantity of that waste that will be handled on an annual basis. For each characteristic or toxic contaminant entered in column A estimate the total annual quantity of all the non–listed waste(s) that will be handled which possess that characteristic or contaminant.

C. UNIT OF MEASURE – For each quantity entered in column B enter the unit of measure code. Units of measure which must be used and the appropriate codes are:

ENGLISH UNIT OF MEASURE	CODE	METRIC UNIT OF MEASURE	CODE
POUNDS	P	KILOGRAMS	K
TONS	T	METRIC TONS	M

If facility records use any other unit of measure for quantity, the units of measure must be converted into one of the required units of measure taking into account the appropriate density or specific gravity of the waste.

D. PROCESSES

1. PROCESS CODES:
   For listed hazardous waste: For each listed hazardous waste entered in column A select the code(s) from the list of process codes contained in Item III to indicate how the waste will be stored, treated, and/or disposed of at the facility.
   For non–listed hazardous wastes: For each characteristic or toxic contaminant entered in column A, select the code(s) from the list of process codes contained in Item III to indicate all the processes that will be used to store, treat, and/or dispose of all the non–listed hazardous wastes that possess that characteristic or toxic contaminant.
   Note: Four spaces are provided for entering process codes. If more are needed: (1) Enter the first three as described above; (2) Enter "000" in the extreme right box of Item IV-D(1); and (3) Enter in the space provided on page 4, the line number and the additional code(s).

2. PROCESS DESCRIPTION: If a code is not listed for a process that will be used, describe the process in the space provided on the form.

NOTE: HAZARDOUS WASTES DESCRIBED BY MORE THAN ONE EPA HAZARDOUS WASTE NUMBER – Hazardous wastes that can be described by more than one EPA Hazardous Waste Number shall be described on the form as follows:

1. Select one of the EPA Hazardous Waste Numbers and enter it in column A. On the same line complete columns B,C, and D by estimating the total annual quantity of the waste and describing all the processes to be used to treat, store, and/or dispose of the waste.
2. In column A of the next line enter the other EPA Hazardous Waste Number that can be used to describe the waste. In column D(2) on that line enter "included with above" and make no other entries on that line.
3. Repeat step 2 for each other EPA Hazardous Waste Number that can be used to describe the hazardous waste.

EXAMPLE FOR COMPLETING ITEM IV (shown in line numbers X-1, X-2, X-3, and X-4 below) – A facility will treat and dispose of an estimated 900 pounds per year of chrome shavings from leather tanning and finishing operation. In addition, the facility will treat and dispose of three non–listed wastes. Two wastes are corrosive only and there will be an estimated 200 pounds per year of each waste. The other waste is corrosive and ignitable and there will be an estimated 100 pounds per year of that waste. Treatment will be in an incinerator and disposal will be in a landfill.

LINE NO.	A. EPA HAZARD. WASTE NO. (enter code)	B. ESTIMATED ANNUAL QUANTITY OF WASTE	C. UNIT OF MEASURE (enter code)	D. PROCESSES 1. PROCESS CODES (enter)	D. PROCESSES 2. PROCESS DESCRIPTION (if a code is not entered in D(1))
X-1	K054	900	P	T03 D80	
X-2	D001	400	P	T03 D80	
X-3	D001	100	P	T03 D80	
X-4	D002				included with above

II. SITE ACTIVITY:

Complete sections I through VII for all treatment, storage, and/or disposal facilities. Complete the forms (in parenthesis) in section VIII corresponding to the site activities identified below:

___A. Storage and/or Treatment
   1. Containers (I)
   2. Tanks (J)
   3. Surface Impoundments (K)
   4. Waste Piles (L)

___B. Land Treatment (M)

___C. Landfills (N)

___D. Incineration and/or Thermal Treatment (O and P)

___E. Chemical, Physical, and Biological Treatment (Q)

Note: If facility is also a generator or transporter of hazardous waste complete sections IX and X of this form as appropriate.

III. GENERAL FACILITY STANDARDS:
(Part 265 Subpart B)

	Yes	No	NI*	Remark
(A) Has the Regional Administrator been notified regarding:				
1. Receipt of hazardous waste from a foreign source?	___	___	___	_____
2. Facility expansion?	___	___	___	_____
(B) General Waste Analysis:				
1. Has the owner or operator obtained a detailed chemical and physical analysis of the waste?	___	___	___	_____
2. Does the owner or operator have a detailed waste analysis plan on file at the facility?	___	___	___	_____
3. Does the waste analysis plan specify procedures for inspection and analysis of each movement of hazardous waste from off-site?	___	___	___	_____
(C) Security - Do security measures include: (if applicable)				
1. 24-Hour surveillance?	___	___	___	_____
2. Artificial or natural barrier around facility?	___	___	___	_____
3. Controlled entry?	___	___	___	_____
4. Danger sign(s) at entrance?	___	___	___	_____
(D) Do Owner or Operator Inspections Include:				
1. Records of malfunctions?	___	___	___	_____
2. Records of operator error?	___	___	___	_____
3. Records of discharges?	___	___	___	_____

*Not Inspected

	Yes	No	NI*	Remarks
4. Inspection schedule?				
5. Safety, emergency equipment?				
6. Security devices?				
7. Operating and structural devices?				
8. Inspection log?				
(E) Do personnel training records include: (Effective 5/19/81)				
1. Job titles?				
2. Job descriptions?				
3. Description of training?				
4. Records of training?				
5. Have facility personnel received required training by 5-19-81?				
6. Do new personnel receive required training within six months?				
(F) If required are the following special requirements for ignitable, reactive, or incompatible wastes addressed?				
1. Special handling?				
2. No smoking signs?				
3. Separation and protection from ignition sources?				

*Not Inspected

IV. PREPAREDNESS AND PREVENTION:
(Part 265 Subpart C)

	Yes	No	NI*	Remarks
(A) Maintenance and Operation of Facility: Is there any evidence of fire, explosion, or release of hazardous waste or hazardous waste constituent?	___	___	___	_____
(B) If required, does the facility have the following equipment:				
1. Internal communications or alarm systems?	___	___	___	_____
2. Telephone or 2-way radios at the scene of operations?	___	___	___	_____
3. Portable fire extinguishers, fire control, spill control equipment and decontamination equipment?	___	___	___	_____

Indicate the volume of water and/or foam available for fire control:

_____

_____

(C) Testing and Maintenance of Emergency Equipment:				
1. Has the owner or operator established testing and maintenance procedures for emergency equipment?	___	___	___	_____
2. Is emergency equipment maintained in operable conditions?	___	___	___	_____
(D) Has owner or operator provided immediate access to internal alarms? (if needed)	___	___	___	_____

*Not Inspected

(E) Is there adequate aisle space for unobstructed movement? ___ ___ ___ _____

V. CONTINGENCY PLAN AND EMERGENCY PROCEDURES: (Part 265 Subpart D)

(A) Does the Contingency Plan contain the following information:	Yes	No	NI*	Remarks
1. The actions facility personnel must take to comply with §265.51 and 265.56 in response to fires, explosions, or any unplanned release of hazardous waste? (If the owner has a Spill Prevention, Control, and Countermeasures (SPCC) Plan, he needs only to amend that plan to incorporate hazardous waste management provisions that are sufficient to comply with the requirements of this Part (as applicable.)	___	___	___	_____
2. Arrangements agreed by local police departments, fire departments hospitals, contractors, and State and local emergency response teams to coordinate emergency services pursuant to §265.37?	___	___	___	_____
3. Names, addresses, and phone numbers (office and home) of all persons qualified to act as emergency coordinators?	___	___	___	_____
4. A list of all emergency equipment at the facility which includes the location and physical description of each item on the list and a brief outline of its capabilities?	___	___	___	_____
5. An evacuation plan for facility personnel where there is a possibility that evacuation could be necessary? (This plan must describe signal(s) to be used to begin evacuation, evacuation routes, and alternate evacuation routes?)	___	___	___	_____

*Not Inspected

V. CONTINGENCY PLAN AND EMERGENCY PROCEDURES - Continued

	Yes	No	NI*	Remarks
(B) Are copies of the Contingency Plan available at site and local emergency organizations?	___	___	___	_____
(C) Emergency Coordinator				
1. Is the facility Emergency Coordinator identified?	___	___	___	_____
2. Is coordinator familiar with all aspects of site operation and emergency procedures?	___	___	___	_____
3. Does the Emergency Coordinator have the authority to carry out the Contingency Plan?	___	___	___	_____
(D) Emergency Procedures				
If an emergency situation has occurred at this facility, has the Emergency Coordinator followed the emergency procedures listed in 265.56?	___	___	___	_____

VI. MANIFEST SYSTEM, RECORDKEEPING, AND REPORTING
(Part 265 Subpart E)

	Yes	No	NI*	Remarks
(A) Use of Manifest System				
1. Does the facility follow the procedures listed in §265.71 for processing each manifest?	___	___	___	_____
2. Are records of past shipments retained for 3 years?	___	___	___	_____
(B) Does the owner or operator meet requirements regarding manifest discrepancies?	___	___	___	_____

*Not Inspected

(C) Operating Record

1. Does the owner or operator maintain an operating record as required in 265.73? ___ ___ ___ _____

2. Does the operating record contain the following information:

**b. The method(s) and date(s) of each waste's treatment, storage, or disposal as required in Appendix I? ___ ___ ___ _____

c. The location and quantity of each hazardous waste within the facility? ___ ___ ___ _____

***d. A map or diagram of each cell or disposal area showing the location and quantity of each hazardous waste? (This information should be cross-referenced to specific manifest number, if waste was accompanied by a manifest.) ___ ___ ___ _____

e. Records and results of all waste analyses, trial tests, monitoring data, and operator inspections? ___ ___ ___ _____

f. Reports detailing all incidents that required implementation of the Contingency Plan? ___ ___ ___ _____

g. All closure and post closure costs as applicable? (Effective 5-19-81) ___ ___ ___ _____

** See page 33252 of the May 19, 1980, Federal Register.

*** Only applies to disposal facilities

*Not Inspected

VII. CLOSURE AND POST CLOSURE
(Part 265 Subpart G)

	Yes	No	NI*	Remarks
(A) Closure and Post Closure				
1. Is the facility closure plan available for inspection by May 19, 1981?	___	___	___	_____
2. Has this plan been submitted to the Regional Administrator	___	___	___	_____
3. Has closure begun?	___	___	___	_____
4. Is closure estimate available by May 19, 1981?	___	___	___	_____
(B) Post closure care and use of property				
Has the owner or operator supplied a post closure monitoring plan? (effective by May 19, 1981)	___	___	___	_____

VIII. FACILITY STANDARDS
(Part 265, Subparts I thru R)

I
USE AND MANAGEMENT OF CONTAINERS

Facility Name: _____ Date of Inspection: _____

	Yes	No	NI*	Remarks
1. Are containers in good condition?	___	___	___	_____
2. Are containers compatible with waste in them?	___	___	___	_____
3. Are containers stored closed?	___	___	___	_____
4. Are containers managed to prevent leaks?	___	___	___	_____
5. Are containers inspected weekly for leaks and defects?	___	___	___	_____
6. Are ignitable & reactive wastes stored at least 15 meters (50 feet) from the facility property line? (Indicate if waste is ignitable or reactive.)	___	___	___	_____

	Yes	No	NI	Remarks
7. Are incompatible wastes stored in separate containers? (If not, the provisions of 40 CFR 265.17(b) apply.)				
8. Are containers of incompatible waste separated or protected from each other by physical barriers or sufficient distance?				

J
TANKS

Facility Name: _____ Date of Inspection: _____

	Yes	No	NI	Remarks
1. Are tanks used to store only those wastes which will not cause corrosion, leakage or premature failure of the tank?				
2. Do uncovered tanks have at least 60 cm (2 feet) of freeboard, or dikes or other containment structures?				
3. Do continuous feed systems have a waste-feed cutoff?				
4. Are waste analyses done before the tanks are used to store a substantially different waste than before?				
5. Are required daily and weekly inspections done?				
6. Are reactive & ignitable wastes in tanks protected or rendered non-reactive or non-ignitable? Indicate if waste is ignitable or reactive. (If waste is rendered non-reactive or non-ignitable, see treatment requirements.)				
7. Are incompatible wastes stored in separate tanks? (If not, the provisions of 40 CFR 265.17(b) apply.)				

*Not Inspected

	Yes	No	NI*	Remarks

8. Has the owner or operator observed the National Fire Protection Association's buffer zone requirements for tanks containing ignitable or reactive wastes?

   Tank capacity: _____ gallons

   Tank diameter: _____ feet

   Distance of tank from property line _____ feet

   (See table 2 - 1 through 2 - 6 of NFPA's "Flammable and Combustible Liquids Code - 1977" to determine compliance.)

K

SURFACE IMPOUNDMENTS

Facility Name: _____ Date of Inspection: _____

	Yes	No	NI*	Remarks
1. Do surface impoundments have at least 60 cm (2 feet) of freeboard?				
2. Do earthen dikes have protective covers?				
3. Are waste analyses done when the impoundment is used to store a substantially different waste than before?				
4. Is the freeboard level inspected at least daily?				
5. Are the dikes inspected weekly for evidence of leaks or deterioration?				
6. Are reactive & ignitable wastes rendered non-reactive or non-ignitable before storage in a surface impoundment? (If waste is rendered non-reactive or non-ignitable, see treatment requirements.)				
7. Are incompatible wastes stored in different impoundments? (If not, the provisions of 40 CFR 265.17(b) apply.)				

WASTE PILES

Facility Name: _____ Date of Inspection: _____

	Yes	No	NI*	Remarks
1. Are waste piles covered or protected from dispersal by wind?				
2. Is each in-coming movement of waste analyzed before being added to the waste pile?				
3. Are leachate, run-off, and run-on controlled as per the requirements of 265.258? (The effective date of this provision is Nov. 19, 1981.)				
4. Are reactive & ignitable wastes rendered non-reactive or non-ignitable before storage in a pile? Indicate if waste is ignitable or reactive. (If waste is rendered non-reactive or non-ignitable, see treatment requirements.)				
5. Are piles of reactive or ignitable waste protected from materials or conditions that might cause them to ignite or react?				
6. Are incompatible wastes stored in different piles? (If not, the provisions of 40 CFR 265.17(b) apply.)				
7. Are piles of imcompatible waste protected by barriers or distance from other waste?				

*Not Inspected

M

LAND TREATMENT

Facility Name: _____ Date of Inspection: _____

1.	Is treated hazardous waste capable of biological or chemical degradation?	___	___	___
2.	Are run-off and run-on diverted from the facility or collected? (Effective date: November 19, 1981)?	___	___	___
3.	Is waste analyzed according to 265.273?	___	___	___
4.	If food chain crops are grown at the facility, has the owner or operator addressed the requirements of 265.276?	___	___	___
5.	Is an unsaturated zone monitoring plan designed and implemented to detect the vertical migration of hazardous waste and provide information on the background concentrations of the hazardous waste available?	___	___	___
6.	Does the unsaturated zone monitoring plan address the minimum information specified in 265.278?	___	___	___
7.	Are records kept regarding application dates and rates, quantities, and locations, of all hazardous waste placed in the facility?	___	___	___
8.	Are the special requirements fulfilled regarding land treatment of ignitable or reactive wastes? (Indicate if waste is ignitable or reactive.)	___	___	___
9.	Are incompatible wastes land treated? (If yes, 265.17(b) applies)	___	___	___

LANDFILLS

Facility Name: _____ Date of Inspection: _____

	Yes	No	NI*	Remarks
(A) General Operating Requirements Does the facility provide the following:				
**1. Diversion of run-on away from active portions of the fill?				
**2. Collection of run-off from active portions of the fill?				
**3. Is collected run off treated?				
4. Control of wind dispersal of hazardous waste?				
(**Effective 11-19-81)				
(B) Surveying and Recordkeeping Does the Operating Record Include:				
1. A map showing the exact location and dimensions of each cell?				
2. The contents of each cell and the location of each hazardous waste type withing each cell?				
(C) Closure and Post-Closure				
1. Is the Closure Plan available for inspection by 5-19-81?				
2. Has this plan been submitted to the Regional Administrator?				
3. Has closure begun?				
4. Is closure cost estimate available by 5-19-81?				
(D) Special requirements for ignitable or reactive waste				
Are ignitable or reactive waste treated so the resulting mixture is no longer ignitable or reactive?				

	Yes	No	NI*	Remarks
(If waste is rendered non-reactive or non-ignitable see treatment requirements)				
If not, the provisions of 40 CFR 265.17(b) apply.	___	___	___	_____
(E) Special Requirements for Incompatible Wastes.				
Does the owner or operator dispose of incompatible wastes in separate cells?	___	___	___	_____
If not, the provisions of 40 CFR 265.17(b) apply.	___	___	___	_____
(F) Special requirements for liquid waste (effective 11-19-81)				
1. Are bulk or non-containerized liquids placed in the landfill?	___	___	___	_____
2. Does the landfill have a chemically and physically resistant liner system?	___	___	___	_____
3. Does the landfill have a functional leachate collection system?	___	___	___	_____
4. Are free liquids stabilized prior to or immediately after placement in the landfill?	___	___	___	_____
(G) Special requirements for Containers (effective 11-19-81)				
Are empty containers crushed flat, shredded, or similarly reduced in volume before being buried beneath the surface of the landfill?	___	___	___	_____

*Not Inspected

O and P
INCINERATION and THERMAL TREATMENT

(A) Facility Name: _____

(B) Date of Inspection: _____

I. Determination of Steady State

A. Type of unit (i.e., type of incinerator or thermal treatment): _____

_____

B. Components and steady state condition:

	Component	**** Was this component at SS prior to adding waste? Yes	No	NI*	Remarks
1.	_____	___	___	___	_____
2.	_____	___	___	___	_____
3.	_____	___	___	___	_____
4.	_____	___	___	___	_____
5.	_____	___	___	___	_____

II. Waste Analysis

A. Minimum requirements, for wastes not previously burned/treated.

	1. Required analyses; has an analysis been performed for the following?	Yes	No	NI*	Remarks
a.	Heating value	___	___	___	_____
b.	Halogen content	___	___	___	_____
c.	Sulfur content	___	___	___	_____

*Not Inspected

	Yes	No	NI*	Remarks
2. Has documented or written data been substituted for analysis of either:				
a. Lead?	___	___	___	_____
b. Mercury?	___	___	___	_____

B. List other parameters for which the waste is tested to enable owner or operator to establis steady state or determine the types of pollutants which may be emitted. (Note in Remarks any which you feel should be tested.)

		Remarks
1.	_____	_____
2.	_____	_____
3.	_____	_____
4.	_____	_____
5.	_____	_____

III. Monitoring and Inspections

	Yes	No	NI*	Remarks
A. Are combustion/emission control instruments monitored at least every 15 minutes?	___	___	___	_____
B. Is steady state maintained or corrections attempted?	___	___	___	_____
C. Is stack plume observed at least hourly for normal color and opacity?	___	___	___	_____
D. Did any stack observations made by owner or operator show a plume different than normal?**	___	___	___	_____
E. If yes to D above, were corrections made to return emissions to normal appearance?**	___	___	___	_____
F. Are the complete unit and associated equipment inspected daily for leaks, spills, and fugitive emissions?	___	___	___	_____
G. Are emergency shutdown controls and system alarms checked daily for proper operation?	___	___	___	_____

*Not Inspected
**Specify in Remarks for what period of time this was checked.

IV. Open Burning

A. Only complete this part if the facility open burns hazardous waste.

	Yes	No	NI*	Remarks
1. Does this facility burn only waste explosives? (A No answer means other hazardous waste is open-burned.)	___	___	___	_____
2. If this facility open-burns waste explosives, does it burn the waste at a distance greater than or equal to the minimum specified distance (below)	___	___	___	_____

Pounds of waste explosives or propellants	Minimum distance from open burning or detonation to the property of others	
0 to 100.....	204 m	670 ft
101 to 1,000.....	380 m	1,250 ft
1,001 to 10,000.....	530 m	1,730 ft
10,0001 to 30,000.....	690 m	2,260 ft

Q

CHEMICAL, PHYSICAL and BIOLOGICAL TREATMENT

Facility Name: _____

Date of Inspection: _____

	Yes	No	NI*	Remarks
1. Is equipment used to treat only those wastes which will not cause leakage, corrosion, or premature failure?	___	___	___	_____
2. Is a continuously fed system equipped with a means of hazardous waste inflow stoppage or control (e.g., cut-off system?)	___	___	___	_____

*Not Inspected

	Yes	No	NI*	Remarks
3. Has the owner or operator addressed the waste analysis requirements of 265.402?	___	___	___	_____
4. Are inspection procedures followed according to 265.403?	___	___	___	_____
5. Are the special requirements fulfilled for ignitable or reactive wastes?	___	___	___	_____
6. Are incompatible wastes treated? (If yes, 265.17(b) applies.)	___	___	___	_____

Note: EPA has temporarily suspended the applicability of the requirements of the hazardous waste regulations in 40 CFR Parts 122, 264 and 265 to owners and operators of (1) wastewater treatment tanks that receive, store, and treat wastewaters that are hazardous waste or that generate, store or treat a wastewater treatment sludge which is a hazardous waste where such wastewaters are subject to regulation under Sections 402 or 307(b) of the Clean Water Act (33 U.S.C. 1251 et seq.) and (2) neutralization tanks, transport vehicles, vessels, or containers which neutralize wastes which are hazardous only because they exhibit the corrosivity characteristic under 40 CFR §261.22 or are listed as hazardous wastes in Subpart D of 40 CFR Part 261 only for this reason.

IX

Complete this section if the owner or operator of a TSD facility also generates hazardous waste that is subsequently shipped off-site for treatment, storage, or disposal.

1. MANIFEST REQUIREMENTS

	Yes	No	NI*	Remarks
(A) Does the operator have copies of the manifest available for review?	___	___	___	_____
(B) Do the manifest forms reviewed contain the following information: (If possible, make copies of, or record information from, manifest(s) that do not contain the critical elements)				
1. Manifest document number?	___	___	___	_____
2. Name, mailing address, telephone number, and EPA ID Number of Generator	___	___	___	_____

		Yes	No	NI*	Remarks
3.	Name and EPA ID Number of Transporter(s)?	___	___	___	_____
4.	Name, address, and EPA ID Number of Designated permitted facility and alternate facility?	___	___	___	_____
5.	The description of the waste(s) (DOT shipping name, DOT hazard class, DOT identification number)?	___	___	___	_____
6.	The total quantity of waste(s) and the type and number of containers loaded?	___	___	___	_____
7.	Required certification?	___	___	___	_____
8.	Required signatures?	___	___	___	_____
(C)	Does the owner or operator submit exception reports when needed?	___	___	___	_____

2. PRE-TRANSPORT REQUIREMENTS

(A)	Is waste packaged in accordance with DOT Regulations? (Required prior to movement of hazardous waste off-site)	___	___	___	_____
(B)	Are waste packages marked and labeled in accordance with DOT regulations concerning hazardous waste materials? (Required to movement of hazardous waste off-site)	___	___	___	_____
(C)	If required, are placards available to transporters of hazardous waste?	___	___	___	_____

Omit Section 3 if the facility has interim status and its Part A permit application describes storage

3. On Site Accumulation

	Yes	No	NI*	Remarks
1. Are containers marked with start of accumulation date?	___	___	___	_____
2. Are the containers of hazardous waste removed from installation before they can accumulate for more than 90 days?	___	___	___	_____
3. Are wastes stored in containers managed in accordance with 40 CFR Part 265.174 and 265.176 (weekly inspections of containers, containers holding ignitable or reactive wastes located at least 15 meters (50 Feet) from facility's property line?	___	___	___	_____
4. If wastes are stored in tanks, are the tanks managed according to the following requirements?				
a. Are tanks used to store only those wastes which will not cause corrosion leakage or premature failure of the tank?	___	___	___	_____
b. Do uncovered tanks have at least 60 cm (2 feet) of freeboard, dikes, or other containment structures?	___	___	___	_____
c. Do continuous feed systems have a waste-feed cutoff?	___	___	___	_____
d. Are required daily and weekly inspections done?	___	___	___	_____
e. Are reactive & ignitable wastes in tanks protected or rendered non-reactive or non-ignitable? (If waste is rendered non-reactive or non-ignitable, see treatment requirements?	___	___	___	_____
f. Are incompatible wastes stored in separate tanks? (If not, the provisions of 40 CFR §265.17(b) apply)	___	___	___	_____

*Not Inspected

VI. RECORDKEEPING and REPORTING
(Part 262, Subpart D)

	Yes	No	NI*	Remarks
(A) Are Manifests, Annual Reports, Exception Reports, and all test results and analyses retained for at least three years?	___	___	___	_____
(B) Has the generator submitted Annual Reports and Exception Reports as required?	___	___	___	_____

VII. INTERNATIONAL SHIPMENTS
(Part 262, Subpart E)

Has the installation imported or exported Hazardous Waste?	___	___	___	_____

(If answered Yes, complete the following as applicable.)

1. Exporting Hazardous waste, has a generator:				
a. Notified the Administrator in writing?	___	___	___	_____
b. Obtained the signature of the foreign consignee confirming delivery of the waste(s) in the foreign country?	___	___	___	_____
c. Met the Manifest requirements?	___	___	___	_____
2. Importing Hazardous Waste, has the generator:				
Met the manifest requirements?	___	___	___	_____

*Not Inspected

X

TRANSPORTER REQUIREMENTS
40 CFR Part 263

Complete this Section if the owner or operator transports hazardous waste.

I. MANIFEST SYSTEM AND RECORDKEEPING
(Subpart B)

	Yes	No	NI*	Remarks
Are copies of the completed manifests or shipping paper(s) available for review and retained for three years?	___	___	___	_____

II. INTERNATIOINAL SHIPMENTS

	Yes	No	NI*	Remarks
A. Does the transporter record on the manifest the date the waste left the U.S.?	___	___	___	_____
B. Are signed completed manifest(s) on file?	___	___	___	_____

V. MISCELLANEOUS

	Yes	No	NI*	Remarks
A. Does transporter transport hazardous waste into the U.S. from abroad?	___	___	___	_____
B. Does the transporter mix hazardous waste of different DOT shipping descriptions by placing them into a single container?	___	___	___	_____

NOTE: If (A) or (B) were answered "Yes" then the Transporter is also a Generator and must comply with the Generator regulations.

*Not Inspected

REMARKS

Use this section to briefly describe site activities observed at the time of the inspection. Note any possible violations of Interim Status Standards.

RE: Henry Co.
ISS Inspections

July 13, 1981

RCRA Activities
P.O. Box 7861
Chicago, Illinois 60680

Gentlemen:

RE: EPA ID #OHD005419171

On November 19, 1980, Campbell Soup Company, located at Napoleon, Ohio, forwarded to your office a completed Hazardous Waste Permit Application. This was a precautionary or protective notification because we were uncertain whether or not the two mixtures we listed as F017 and D001 were subject to all regulations issued pursuant to the federal Resource Conservation and Recovery Act (RCRA). We have now determined that under the present regulations, including RCRA regulations Section 261.6, we are neither subject to the regulations affecting generators of hazardous waste nor to those affecting treatment, storage, or disposal facilities. We hereby request withdrawal of our RCRA Part A application filed November 19, 1980.

More specifically, as discussed in our April 7, 1981, letter to the Ohio EPA, copy attached, we have now determined that the mixture we listed as F017 in fact is neither F017 nor a listed or unlisted hazardous waste. (We also note that F017 has been at least temporarily delisted.) Moreover, the mixture we listed as D001 on our application has a heat value of over 132,000 BTU's per gallon, has been beneficially used by us on-site as a fuel supplement in our boilers for the last three years, and continues to be so beneficially used. Accordingly, pursuant to RCRA regulations, Section 261.6(a), this mixture is not subject to RCRA regulations, Parts 262-5, Parts 122-124, or RCRA, Section 3010.

Sincerely,

CAMPBELL SOUP COMPANY

RE: Hazardous Waste Co,
ISS Inspections

April 7, 1981

Hazardous Waste Task Force
P. O. Box 1049
361 E. Broad Street
Columbus, OH 43216

Gentlemen:

Pursuant to your request, enclosed please find a copy of the U.S. Environmental Protection Agency Hazardous Waste Application, Part A, filed by this plant November 19, 1980, as part of its obtaining and maintaining "interim status" as a treatment, storage, or disposal facility. As you will note, that Application referred to F017 as a hazardous waste in our plant.

However, we have now determined that the mixture we referred to as F017 on our Application is neither a listed nor unlisted hazardous waste, as defined by the Environmental Protection Agency's regulations issued pursuant to the federal Resource Conservation and Recovery Act, for the following reasons:

a. The Environmental Protection Agency has at least temporarily suspended F017 as a listed hazardous waste (January 16, 1981, Federal Register).
b. Although we referred to our mixture as F017 on our Application in an excess of caution, we have now determined, based on further knowledge of our own mixture, that our mixture in fact did and does not come within the definition of F017.
c. The mixture we referred to as F017 is an aqueous solution, with no or almost no alcohol content, and does not meet the characteristics of hazardous waste as defined in Part 261, Subpart C, of the Environmental Protection Agency's regulations issued pursuant to the federal Resource Conservation and Recovery Act.

If there are any questions concerning this application, please call me at (419) 592-1010 ext. 343.

Sincerely,

CAMPBELL SOUP COMPANY

Receipt of New Closure Plan
EPA ID No.: OHD 005 419 171

Campbell Soup Company
Attn: Mr. Michael Maringer
1273 State Route 110
Napoleon, Ohio 43545

Dear Mr. Maringer:

This letter is an acknowledgment of Ohio EPA's receipt of the new closure plan for the hazardous waste surface impoundment from the Campbell Soup Company, located at 1273 State Route 110 in Napoleon, Ohio. The new plan was received by the Ohio EPA's Central Office on October 31, 2001. A public notice concerning receipt of the plan and its availability for public review will appear on November 21, 2001 in the Northeast Signal newspaper. The Director of Ohio EPA will act upon the closure plan after the close of the public comment period on December 20, 2001.

A copy of the new closure plan is available for public review at the Napoleon Public Library, 310 West Clinton Street, Napoleon, Ohio 43545, and at the Ohio EPA, Northwest District Office, 347 Dunbridge Road, Bowling Green, Ohio 43402, tel:(419) 352-8461.

Please contact Michael Terpinski of the Northwest District Office if you have any questions on this matter.

Sincerely,

PUBLIC NOTICE

Henry County

OHIO EPA RECEIVES NEW HAZARDOUS WASTE CLOSURE PLAN

On October 31, 2001, Ohio EPA received a new hazardous waste closure plan from Campbell Soup Company for its surface impoundment at 1273 State Route 110, Napoleon, Ohio 43545. The EPA Identification Number for this facility is OHD005419171.

Why is Campbell Soup Company submitting this Closure Plan?

As the result of an Order issued by Ohio EPA, Campbell Soup Company submitted this closure plan to fulfill the requirements contained in the Order. This new closure plan identifies material detected at the site resulting from soil borings, outlines the means in which hazardous waste will be removed from the facility's holding pit and the activities associated with soil clean-up.

When and how do I submit written comments about this Closure Plan?

You can submit written comments anytime between November 21 and December 20, 2001. Send your comments to Ohio EPA, Division of Hazardous Waste Management, Attn: Information Technologies and Technical Support Section, P.O. Box 1049, Columbus, Ohio 43216, telephone number (614) 644-2977, fax number (614) 728-1245, e-mail address: dhwmcomments@epa.state.oh.us

Where can I review the Closure Plan?

You can review the Closure Plan at the following locations:

Napoleon Public Library, 310 West Clinton Street, Napoleon, Ohio 43545, tel: (419) 592-2531,

Ohio EPA, Northwest District Office, 347 Dunbridge Road, Bowling Green, Ohio 43402, tel: (419) 352-8461,

Ohio EPA, Division of Hazardous Waste Management, 122 South Front Street, Columbus, Ohio 43215 (614) 644-2977.

For excavation, both the sidewalls and bottom areas would be included in the determination of the area size. The following equation is used to determine grid intervals for stationing over a medium sized site (11,000 to 130,000 square feet).

$$GI = (A/\pi)^{1/2} / 4$$

WHERE: A = area to be grid (square feet), including floor and sidewalls

GI = grid interval

π = 3.14159

The combined surface area of the excavation floor and the sidewalls is expected to be approximately 20,000 square feet, which results in a calculated grid interval of 20 feet.

14.2 Sampling of Grid

Sampling of grids may include all of the grid stations or a phased subset of the total stations. The subset of grid stations is created by assigning coordinates to all the nodes and randomly selecting nodes using a random number generator or a random number table.

Based on the grid interval calculated for this excavation, there will be approximately 35 grid nodes across the excavation floor, and 21 nodes across the excavation walls, for 56 total possible sample locations. Based on the 25% guideline, a minimum of 14 samples will need to be collected before statistical conditions can be met. This number of samples is suitable, considering that 51 borings were advanced previously to delineate the vertical and horizontal extent of contamination.

A minimum of 20 sidewall and floor samples is proposed to verify that the cleanup standards have been met in the excavation. The sample locations will be selected from randomized locations within a grid pattern distributed across the excavation floor, and at nodal distances along the excavation sidewalls.

RE: Campbell Soup Company and Campbell Soup Supply Company L.L.C. - Amendment to Director's Final Findings and Orders of October 18, 2000

Dear Dr. Aly:

I am in receipt of your July 19, 2001 letter and attachments. The documents attached to your July 19, 2001 letter consisted of a redlined version and a signed version of the amended Director's Final Findings and Orders. As we discussed in our telephone conversation, I have reviewed the attachments and have concluded that it is necessary to provide to you for signature another set of amended Director's Final Findings and Orders. The amended Director's Final Findings and Orders are attached for your review. Please note that all of your redline comments have been incorporated into the attached orders.

Please have a responsible corporate officer of the Campbell Soup Company and Campbell Soup Supply Company L.L.C. sign and date the attached orders and return the originally signed and dated orders to me. I apologize for any inconvenience encountered in obtaining signatures on the orders again. However, as we previously discussed it is necessary to do so.

If you have any questions, please do not hesitate to contact me at (614) 644-2840. Thank you in advance for your cooperation in this matter.

Sincerely,

Todd A. Anderson
Staff Attorney

BEFORE THE
OHIO ENVIRONMENTAL PROTECTION AGENCY

In the Matter of:

Campbell Soup Company
World Headquarters
1 Campbell Place
Camden, NJ 08103-1799

and

Campbell Soup Supply Company L.L.C.
12 773 State Route 110
Napoleon, OH 43545

Respondents

Director's Final Findings and Orders

AMENDMENT TO DIRECTOR'S FINAL FINDINGS AND ORDERS OF OCTOBER 18, 2000

PREAMBLE

It is hereby agreed by and among the parties hereto as follows:

I. JURISDICTION

These Director's Final Findings and Orders (Orders) are issued to the Campbell Soup Company and Campbell Soup Supply Company L.L.C. (Respondents) pursuant to the authority vested in the director of the Ohio Environmental Protection Agency (Ohio EPA) under § 3734.13 and § 3745.01 of the Ohio Revised Code (ORC).

II. PARTIES BOUND

These Orders shall apply to and be binding upon the Respondents, their assigns and successors in interest. No changes in ownership relating to the Facility will in any way alter the Respondents' responsibilities under these Orders. The Respondents' obligations under these Orders may be altered only by the written approval of the director of Ohio EPA.

III. DEFINITIONS

1. Unless otherwise stated, all terms in these Orders shall have the same meaning as used in the Director's Final Findings and Orders of October 18, 2000, and as used in Chapter 3734. of the ORC and the regulations promulgated thereunder.

2. The effective date of these Orders is the date these Orders are entered into the Ohio EPA director's journal.

IV. FINDINGS OF FACT

The Director of Ohio EPA has determined the following findings of fact:

1. On October 18, 2000, the director issued Director's Final Findings and Orders to Respondents. All findings of fact made in the October 18, 2000, Director's Final Findings and Orders are hereby incorporated by reference.

2. The October 18, 2000 Director's Final Findings and Orders required Respondents to, *inter alia*, submit to Ohio EPA for review and approval a closure plan to close the Pits area at the Facility where hazardous waste was disposed of without a permit.

3. On November 2, 2000, Respondents submitted to Ohio EPA a closure plan as required by Order No. 1 of the October 18, 2000, Director's Final Findings and Orders.

4. By letter dated March 30, 2001, Respondents submitted to Ohio EPA a request to withdraw the closure plan due to technical deficiencies contained within the closure plan. Respondents also requested an extension of time in which to submit a revised closure plan correcting technical deficiencies. In support of the extension request, Respondents have committed to working closely with Ohio EPA to correct all of the technical deficiencies prior to resubmitting to Ohio EPA the closure plan.

V. ORDERS

The Respondents shall achieve compliance with Chapter 3734. of the ORC and the regulations promulgated thereunder according to the following compliance schedule:

1. The October 18, 2000 Director's Final Findings and Orders are amended as follows:

   a. Order No. 1 is superseded and replaced with the following new Order No. 1:

      Respondents shall close the Pits area at the Facility where hazardous waste was disposed of without a permit, in accordance with OAC rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20. Within 60 days after the effective date of these Orders, Respondents shall submit to Ohio EPA a closure plan, prepared in accordance with OAC rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20.

   b. Order No. 5 is superseded and replaced with the following new Order No. 5:

      Within 60 days after the effective date of these Orders, Respondents shall submit to Ohio EPA a closure cost estimate and documentation demonstrating that Respondents have established financial assurance and liability coverage for closure in accordance with OAC rules 3745-55-42/3745-66-42 through 3745-55-47/3745-66-47.

2. Except as noted in these Orders, all terms and conditions of the October 18, 2000 Director's Final Findings and Orders remain valid and in effect.

VI. TERMINATION

The Respondents' obligations under these Orders shall terminate when the Respondents demonstrate in writing and certify to the satisfaction of Ohio EPA that all obligations under these Orders have been performed and Ohio EPA's Division of Hazardous Waste Management acknowledges, in writing, Ohio EPA's acceptance of this demonstration and certification.

This certification shall be submitted by the Respondents and shall be signed by a responsible official of the Respondents. The certification shall make the following attestation: "I certify that the information contained in or accompanying this certification is true, accurate and complete."

For purposes of these Orders, a responsible official is a corporate officer who is in charge of a principal business function of the Respondents.

VII. OTHER CLAIMS

Nothing in these Orders shall constitute or be construed as a release from any claim, cause of action or demand in law or equity against any person, firm, partnership or corporation, not a signatory to these Orders, for any liability arising out of or relating to the operations of the Respondents' Facility.

VIII. OTHER APPLICABLE LAWS

All actions required to be taken pursuant to these Orders shall be undertaken in accordance with the requirements of all applicable local, state and federal laws and regulations. Nothing in these Orders shall be construed as waiving or compromising in any way the applicability and enforcement of any other statutes or regulations applicable to the Respondents' operation of the Facility. Ohio EPA reserves all rights and privileges except as specified herein. Respondents reserve all rights and defenses which may be available at law or in equity and under any statute, regulation or common law applicable to Respondents' operation of the Facility, except as specified herein.

IX. NOTICE

All documents demonstrating compliance with these Orders, and other documents required under these Orders to be submitted to Ohio EPA, shall be addressed to:

Ohio Environmental Protection Agency
Northwest District Office
Division of Hazardous Waste Management
Attn: DHWM Manager
347 North Dunbridge Road
Bowling Green, OH 43402

and Ohio EPA Central Office at the following address:

For mailings, use the post office box number:

Christopher Jones, Director
Ohio Environmental Protection Agency
Lazarus Government Center
Division of Hazardous Waste Management
Attn: Manager, Compliance Assurance Section
P.O. Box 1049
Columbus, Ohio 43216-1049

For deliveries to the building and courier services:

Christopher Jones, Director
Ohio Environmental Protection Agency
Lazarus Government Center
Division of Hazardous Waste Management
Attn: Manager, Compliance Assurance Section
122 South Front Street
Columbus, Ohio 43215

or to such persons and addresses as may hereafter be otherwise specified in writing by Ohio EPA.

All documents to be submitted to Respondents under this Order shall be addressed to:

Dr. Osman Aly
Environmental Consultant
Campbell Soup Company
Campbell Place
Camden, New Jersey 08103

and

Faith R. Greenfield, Esq.
Campbell Soup Company
Campbell Place
Camden, New Jersey 08103

X. RESERVATION OF RIGHTS

Nothing contained herein shall be construed to prevent Ohio EPA from seeking legal or equitable relief to enforce the terms of these Orders or from taking administrative, legal or equitable action as deemed appropriate and necessary, including seeking penalties against the Respondents for noncompliance with these Orders. Nothing contained herein shall be construed to prevent Ohio EPA from exercising its lawful authority to require the Respondents to perform additional activities, including closure of additional hazardous waste management units at the Facility, pursuant to ORC Chapter 3734. or any other applicable law in the future. Nothing herein shall restrict the right of the Respondents to raise any administrative, legal or equitable claim or defense with respect to such further actions which Ohio EPA may seek to require of the Respondents. Nothing in these Orders shall be construed to limit the authority of Ohio EPA to seek relief for violations not addressed in these Orders.

XI. SIGNATORIES

Each undersigned representative of a signatory to these Orders certifies that he or she is fully authorized to enter into these Orders and to legally bind such signatory to this document.

IT IS SO ORDERED:

_____ _____

Christopher Jones
Director

Date

XII. WAIVER

In order to resolve disputed claims, without admission of fact, violation or liability, and, subject to Section X of these Orders, in lieu of further enforcement action by Ohio EPA for only the violations addressed in these Orders, the Respondents agree that these Orders are lawful and reasonable, that the times provided for compliance herein are reasonable and that the Respondents agree to comply with these Orders. Subject to Section X., above, compliance with these Orders shall be a full accord and satisfaction for the Respondents' liability for the violations cited herein.

The Respondents hereby waive the right to appeal the issuance, terms and service of these Orders and hereby waive any and all rights they might have to seek administrative or judicial review of these Orders either in law or equity.

Notwithstanding the preceding, Ohio EPA and the Respondents agree that in the event that these Orders are appealed by any other party to the Environmental Review Appeals Commission, or any court, the Respondents retain the right to intervene and participate in such appeal. In such an event, the Respondents shall continue to comply with these Orders notwithstanding such appeal and intervention unless these Orders are stayed, vacated or modified.

**Re: Campbell Soup Company and Campbell Soup Supply Company L.L.C.
Proposed Amendment to Director's Final Findings and Orders of
October 18, 2000**

Dear Dr. Aly:

Attached, as we discussed, are proposed Amended Director's Final Findings and Orders. The attached orders amend the Director's Final Findings and Orders of October 18, 2000 and propose to grant to Campbell Soup Supply Company L.L.C. and Campbell Soup Company a time extension for the submittal to Ohio EPA of a closure plan, as you requested.

Please review the Amended Director's Final Findings and Orders. I trust the orders, as amended, will meet with your approval. Please have a responsible corporate official of Campbell Soup Supply Company L.L.C. and Campbell Soup Company sign and date the orders and return the originally signed and dated orders to me. In turn, I and the Division of Hazardous Waste Management will recommend to the director of Ohio EPA that he sign the orders. The amended orders will then be entered into the director's journal and a copy of the amended orders, evidence of journalization, will be provided to you.

Section V, paragraphs 1. and 5. of the proposed amended orders, which replace paragraphs 1. and 5. of the October 18, 2000 orders, require that you submit a closure plan and information demonstrating that financial assurance has been established to Ohio EPA within 60 days after the effective date of the amended orders. Please note the effective date of the amended orders is the date of journalization. If you have any questions, or if there are any issues we need to discuss, please do not hesitate to contact me at (614) 644-2840.

Thank you in advance for your attention to this matter.

Sincerely,

Todd Anderson

Todd Anderson

Camden, NJ 08103-1799

and

Campbell Soup Supply Company L.L.C.
12 773 State Route 110
Napoleon, OH 43545

Respondents

Director's Final Findings and Orders

AMENDMENT TO DIRECTOR'S FINAL FINDINGS AND ORDERS OF OCTOBER 18, 2000

PREAMBLE

It is hereby agreed by and among the parties hereto as follows:

I. JURISDICTION

These Director's Final Findings and Orders (Orders) are issued to the Campbell Soup Company and Campbell Soup Supply Company L.L.C. (Respondents) pursuant to the authority vested in the Director of the Ohio Environmental Protection Agency (Ohio EPA) under § 3734.13 and § 3745.01 of the Ohio Revised Code (ORC).

II. PARTIES BOUND

These Orders shall apply to and be binding upon the Respondents, their assigns and successors in interest. No changes in ownership relating to the Facility will in any way alter the Respondents' responsibilities under these Orders. The Respondents' obligations under these Orders may be altered only by the written approval of the director of Ohio EPA.

III. DEFINITIONS

1. Unless otherwise stated, all terms in these Orders shall have the same meaning as used in the Director's Final Findings and Orders of October 18, 2000, and as used in Chapter 3734. of the ORC and the regulations promulgated thereunder.

2. The effective date of these Orders is the date these Orders are entered into the Ohio EPA Director's journal.

IV. FINDINGS OF FACT

The Director of Ohio EPA has determined the following findings of fact:

1. On October 18, 2000, the director issued Director's Final Findings and Orders to Respondents. All findings of fact made in the October 18, 2000, Director's Final Findings and Orders are hereby incorporated by reference.

2. The October 18, 2000 Director's Final Findings and Orders required Respondents to, *inter alia*, submit to Ohio EPA for review and approval a closure plan to close the Pits area at the Facility where hazardous waste was disposed of without a permit.

3. On November 2, 2000, Respondents submitted to Ohio EPA a closure plan as required by Order No. 1 of the October 18, 2000, Director's Final Findings and Orders.

4. By letter dated March 30, 2001, Respondents submitted to Ohio EPA a request to withdraw the closure plan due to numerous technical deficiencies contained within the closure plan. Respondents also requested an extension of time in which to submit a revised closure plan correcting the numerous technical deficiencies. In support of the extension request, Respondents have committed to working closely with Ohio EPA to correct all of the technical deficiencies prior to resubmitting to Ohio EPA the closure plan.

V. ORDERS

The Respondents shall achieve compliance with Chapter 3734. of the ORC and the regulations promulgated thereunder according to the following compliance schedule:

1. The October 18, 2000 Director's Final Findings and Orders are amended as follows:

   a. Order No. 1 is superseded and replaced with the following new Order No. 1:

      Respondents shall close the Pits area at the Facility where hazardous waste was disposed of without a permit, in accordance with OAC rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20. Within 60 days after the effective date of these Orders, Respondents shall submit to Ohio EPA a closure plan, prepared in accordance with OAC rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20.

   b. Order No. 5 is superseded and replaced with the following new Order No. 5:

      Within 60 days after the effective date of these Orders, Respondents shall submit to Ohio EPA a closure cost estimate and documentation demonstrating that Respondents have established financial assurance and liability coverage for closure in accordance with OAC rules 3745-55-42/3745-66-42 through 3745-55-47/3745-66-47.

2. Except as noted in these Orders, all terms and conditions of the October 18, 2000 Director's Final Findings and Orders remain valid and in effect.

VI. TERMINATION

The Respondents' obligations under these Orders shall terminate when the Respondents demonstrate in writing and certify to the satisfaction of Ohio EPA that all obligations under these Orders have been performed and Ohio EPA's Division of Hazardous Waste Management acknowledges, in writing, Ohio EPA's acceptance of this demonstration and certification.

This certification shall be submitted by the Respondents and shall be signed by a responsible official of the Respondents. The certification shall make the following attestation: "I certify that the information contained in or accompanying this certification is true, accurate and complete."

For purposes of these Orders, a responsible official is a corporate officer who is in charge of a principal business function of the Respondents.

VII. OTHER CLAIMS

Nothing in these Orders shall constitute or be construed as a release from any claim, cause of action or demand in law or equity against any person, firm, partnership or corporation, not a signatory to these Orders, for any liability arising out of or relating to the operations of the Respondents' Facility.

VIII. OTHER APPLICABLE LAWS

All actions required to be taken pursuant to these Orders shall be undertaken in accordance with the requirements of all applicable local, state and federal laws and regulations. Nothing in these Orders shall be construed as waiving or compromising in any way the applicability and enforcement of any other statutes or regulations applicable to the Respondents' operation of the Facility. Ohio EPA reserves all rights and privileges except as specified herein. Respondents reserve all rights and defenses which may be available at law or in equity and under any statute, regulation or common law applicable to Respondents' operation of the Facility, except as specified herein.

IX. NOTICE

All documents demonstrating compliance with these Orders, and other documents required under these Orders to be submitted to Ohio EPA, shall be addressed to:

Ohio Environmental Protection Agency
Northwest District Office
Division of Hazardous Waste Management
Attn: DHWM Manager
347 North Dunbridge Road

Remarks:

Mike – I am sending you some general information about dynamic work plan remedial investigations (using field analytical data to delineate contamination in one visit). Because we are loosely following this protocol for delineating the contaminated area at the Campbell Soup Napoleon Facility, it may be worthwhile for you to skim these documents - especially the EPA / Tufts University sponsored document - to understand what we're attempting to do.

If you have any questions, please feel free to call me at 734-213-5042.

1.0 Introduction

The ability to rapidly assess the disposition of environmental contaminants at purported or existing hazardous waste sites is an essential component of the nation's environmental restoration program. Each site, whether owned by the public or private sector, must be evaluated to determine whether risk to human health or the environment exists. If the data obtained supports the notion that no risk or an acceptable level of risk exists for the intended land usage then no further action may be required. If, on the other hand, sufficient risk has been determined to warrant a full site characterization, the site investigation effort must delineate the nature, extent, direction, concentration and rate of movement of the contamination along with the physical and chemical site attributes.

Despite the best efforts of the U.S. Environmental Protection Agency[1] (EPA) and other federal agencies including the Departments of Defense and Energy to validate field analytical technologies, field analytics has not played a significant role in either hazardous waste site assessments or cleanup. In 1995, the EPA issued a Request for Proposals in support of President Clinton's efforts to promote application of innovative environmental technologies and to address the many factors that might pose barriers toward their commercialization. The President's Environmental Technology Initiative (ETI) is focused on accelerating environmental protection, strengthening America's industrial base, and increasing exports of U.S. technologies and expertise. The Tufts project was directed at two key objectives identified in the FY95 strategic plan: namely, strengthening the capacity of technology developers and users to succeed in environmental innovation *and* strategically investing EPA funds in the development and commercialization of promising new environmental monitoring, control, and remediation technologies.

The dynamic workplan guidance document represents one aspect of these objectives. The document is aimed at helping federal and state regulators, siteowners and their consulting engineers, and remediation companies understand what is involved in constructing and carrying out a dynamic workplan. The purpose of the document is to illustrate the many factors that should be considered in incorporating field analytical instrumentation and methods into an adaptive sampling and analysis program for expediting the site investigation process. This dynamic process should result in a faster, better, and hopefully cheaper site characterization and cleanup. With this goal in mind, field analytical technologies developed by the Tufts' Center for Field Analytical Studies and Technologies and with in-kind support from several commercial companies were demonstrated in the context of a dynamic workplan/adaptive sampling and analysis strategy. The ETI project, in part, supported an ongoing soil investigation study at Hanscom Air Force Base (Bedford, MA), see Hanscom report.[2] With the assistance of EPA Region 1, the Air Force and its contractor (CH2MHill), a video tape was produced illustrating the dynamic site investigation process.

[2] A. Robbat, Jr., Tufts University, Case Study: Dynamic Workplans and Field Analytics: The Keys to Cost-effective Site Investigations, 1997.

1.1 Dynamic Workplans

Successful hazardous waste site investigations should be focused with goals and objectives clearly defined. This does not mean, as has been past practice, that the site investigation process should result in workplans that are "etched in stone." Figure 1 depicts a traditional sampling and analysis program. The workplan relies on pre-specified sampling locations, numbers of samples collected and the types of analysis to be performed. The traditional site investigation is static in its application. It does not provide a framework for changes in direction based on what is learned in the field. Samples are collected, packaged and typically sent off-site for analysis. Because data turnaround times range from several weeks to several months, analytical results are unavailable during the field investigation phase to address data "surprises" or concerns while the sampling team is still on site. Experience has shown that multiple field investigations within the same or subsequent seasons are required to fill data gaps. The traditional process results in several trips to the field by the sample collection and survey teams before the site investigation can be completed. This static process typically occurs during hazardous waste site cleanups as well.

Dynamic workplans, as shown in Figure 2, provide an alternative to the traditional approach. Dynamic workplans rely, in part, on an adaptive sampling and analysis strategy. Rather than dictate the details of the sample analysis to be performed and the location and number of samples to be collected, dynamic workplans specify the decision-making logic that will be used in the field to determine which chemical compounds require analysis, where to collect the samples and when to stop sampling. Adaptive sampling and analysis programs change as the conceptual model for the site is refined based on the analytical results produced in the field. A successful adaptive sampling and analysis program requires analytical methods and instrumentation that are field-practical and can produce data fast enough to support the dynamic workplan process.

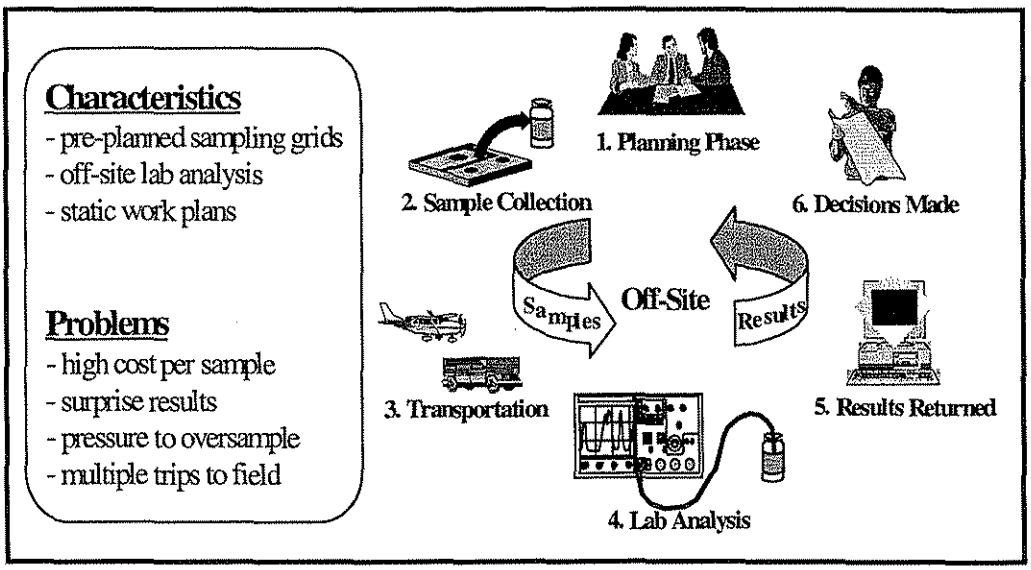

Figure 1. Traditional Site Investigation

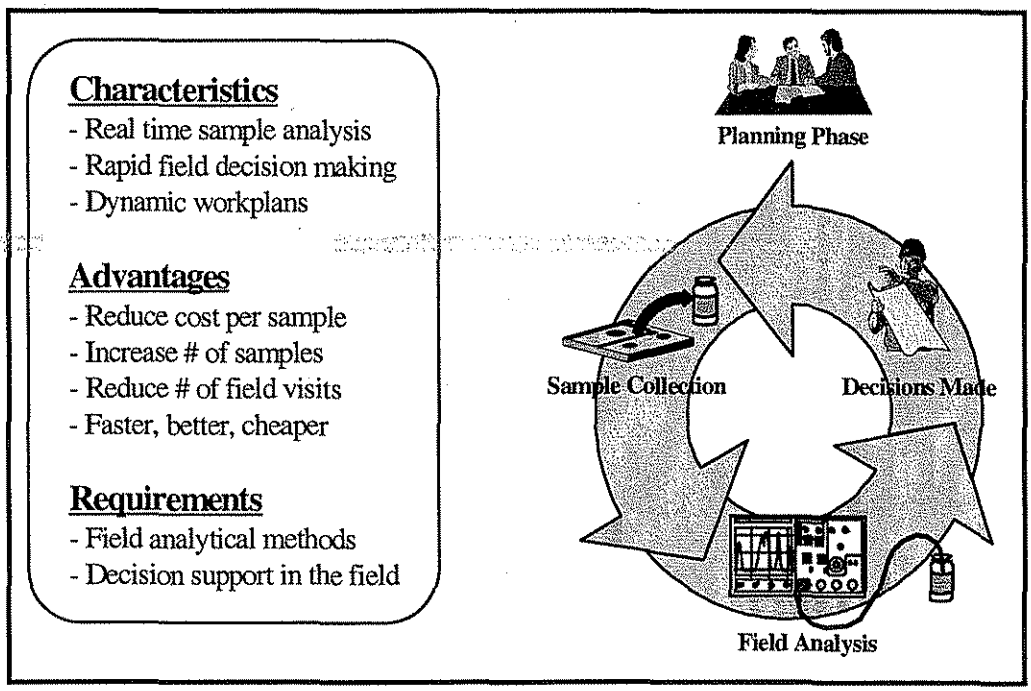

Figure 2. Dynamic Workplan Approach

1.2 Factors to be Considered

When deciding to carry out a Dynamic Workplan/Adaptive Sampling and Analysis program for projects consisting of complex chemical and physical site conditions, environmental contamination, and long duration, several factors should be considered before embarking on this approach. For example:

- Is it possible to assemble a well-rounded core technical team including analytical chemists, engineers, geologists, geochemists, geophysicists, hydrogeologists, risk assessors, and regulators?
- Will the core technical team be in the field for the duration of the field investigation? Is the decision making process well-defined and is the authority vested in an appropriate technical team member?
- Has the action level for field decisions, which rely on developing an understanding of the scientific and engineering questions under investigation, been established as part of the data quality objectives?
- Will the project objectives permit screening and semi-quantitative data or will quantitative data only be required to meet data quality objectives?
- Will more than ten percent of the samples analyzed in the field be sent off-site for laboratory confirmation analysis? Has the methodology for determining field and laboratory data comparisons been addressed?

- When selecting the field instrument or method, have measurement selectivity, sensitivity, precision, accuracy, representativeness, and action levels been addressed?

- When selecting the field instrument or method, have the measurement attributes listed above been addressed in sample throughput rates and cost? (Note that the number of sample cleanup steps and the time needed to prepare samples for analysis to meet the site-specific data quality objectives may limit throughput rates and increase sample costs.)

- Can standard operating procedures and method detection limit studies be completed before mobilization to evaluate matrix interferences that might be associated with a particular field technology?

- Will data management tools and geostatistical sampling tools be integrated into the field investigation?

- Is the site accessible for field analytic deployment including mobile laboratories, electrical power (line voltage versus a generator), and water if necessary?

- Has sufficient space been provided to house analytical instruments and staff, sample preparation, and data management in the field laboratory? Has proper ventilation been incorporated into the field laboratory?

- Does the length of the project and the potential overall cost savings warrant this approach?

2.0 Dynamic Workplan Guideline: Purpose and Objective

Dynamic workplan investigations are site dependent. They include field-based technologies and methods that produce chemical, physical, geological, and hydrogeological information about the site. The data generated must be of sufficient quality, with respect to measurement precision, accuracy, sensitivity, and completeness, to support the objectives of the site investigation or cleanup. The dynamic workplan plan guide described herein is not intended to be all inclusive. It does not address subsurface sampling tools; methods for collecting soil, water, or air samples; remote sensing and geophysical surveys; mathematical or computer modeling; nor will it discuss computer-based statistical sampling or the various site visualization tools. Depending on project objectives, a successful *dynamic* hazardous waste site investigation or cleanup will require one or more of these tools.

The guidance document is aimed at integrating field analytics into the Dynamic Workplan/Adaptive Sampling and Analysis process. It is intended to lay the foundation for incorporating an iterative process into the static but widely-used Data Quality Objectives (DQOs) framework for decision making planning. The guideline outlines field analytical instrument implementation, an adaptive sampling and analysis strategy, and site requirements.

3.0 The Dynamic Workplan Process

In the traditional approach, major decisions concerning the direction of the site investigation or cleanup are generally made by the project manager after the field work has been completed. A report is prepared presenting the findings to the appropriate regulatory body. Discussions begin about whether sufficient information has been obtained to address the scientific and engineering questions of concern. Typically, several field mobilizations occur, reports are written, with many meetings held between the siteowner and its environmental consulting company *and* the siteowner and federal and/or state regulatory agencies. In contrast, these same decisions are made in the field in an adaptive sampling and analysis program. In constructing the dynamic workplan, it is important to determine prior to mobilization what decisions will be made, how these decisions will be made, and who will make them in the field.

Step 1: Select the core technical team whose responsibility it will be to prepare the dynamic workplan. The technical team should possess expertise in analytical chemistry, geology, geochemistry, geophysics, hydrogeology, and risk analysis. The team helps with data management, QA/QC, risk assessment, fate and transport modeling, remedial action, community relations, and health and safety. The technical team will be responsible for:

1) gathering all available information for the site,

2) developing an initial "conceptual" model for the site,

3) identifying the technical objectives and goals to be accomplished,

4) supervising the field effort, making adjustments to the conceptual model based on the data produced in the field, and

5) evaluating the conceptual model and decisions made with respect to federal, state, and local regulations.

The core technical team will be responsible for making decisions in the field. One member of the team must have final decision making authority and responsibility to keep the site investigation process moving forward at a reasonable scientific and cost-effective pace. Some have proposed that the technical team be on site during the entire site investigation study[3]. This may not be practical or economically feasible for every project and is probably unnecessary given the currently available computer and telecommunication technologies. At least one member of the technical team should be on site at all times. This person must have a working knowledge of all aspects of the investigation or cleanup DQOs and be in daily communications with technical team members via electronic data transfer. Field personnel (and off-site technical team members) should be in regular communication with staff from federal and/or state regulatory agencies to ensure that decisions made in the field, typically under the pressures of time and field-resources utilization, are in conformance with the dynamic workplan framework.

---

[3] ASTM Draft Provisional Standard Guide for Expedited Site Characterization of Vadose Zone and Ground Water Contamination, July, 1996.

Step 2: Develop the Initial Conceptual Model and Decision Making Framework.

Initial Conceptual Model. The initial conceptual model contains the best-available information at the start of the project. It depicts the three-dimensional site profile based on vadose zone and ground water flow systems that can exert influence on contaminant movement. Key site features such as roads, buildings, hydrography, depth to bedrock, direction of ground water flow, and potential preferential pathways for contaminant transport are mapped. Map cross sections should include water levels, high and low permeability zones, and aquifers. The conceptual site model is updated as additional data becomes available during the site investigation or cleanup process. The conceptual model is dynamic in nature and changes to reflect the increased site knowledge gained from field activities.

To assure efficient, effective decision-making the regulatory oversight organization should be included in developing the dynamic workplan. Stakeholders should 1) agree at the beginning on the most likely kinds of action(s) to be taken as a result of the field data, 2) implement the appropriate action on a daily basis as the data is generated, and 3) take new directions when the data suggests deviations from the conceptual model. It should be pointed out that site delineation is an iterative process and should be viewed as an ongoing experimental project.

The Decision Making Framework. The initial conceptual model is based on the Data Quality Objectives (DQO) for the site. The DQO process involves a series of planning steps designed to ensure that the type, quantity, and quality of environmental data used in decision making are appropriate for the intended application. It relates data needs to specific decisions to be made[4]. Briefly, the data quality objective process involves:

- Statement of the Problem. Concisely describe the overall study objectives outlining the scientific and engineering issues to be addressed. Review prior field studies and existing information to gain an understanding of the problem(s). Fuse soft information with hard data.

- Identify the Decisions to be Made that Will Address Each Problem. Independently, and then collectively, identify the types of decisions that will solve the problem(s) and the quality of sample collection and field analytical data required.

- Identify the Inputs to the Decision. Identify the information that needs to be learned in the field and the type of data quality needed to make field decisions.

- Define the Study Boundaries. Specify the range of conditions (time periods and situations) to which field decisions will apply, and within which field data will be collected.

---

[4] EPA QA/G-4, "Guidance for the Data Quality Objectives Process" September 1994.

- Develop Decision Rules. Integrate the decision outputs from previous steps into an "if...then..." statement that defines the conditions that would cause the decision maker in the field to choose alternative actions and/or take different directions to solve the problem(s).

- Specify Acceptable Limits on Decisions. Define the decision maker's continuation on a given pathway or alternative action based on field data produced on site: Has the direction followed gone far enough such that any further continuance provides no or marginal added value on a cost/benefit basis?

- Optimize the Conceptual Model. Evaluate information from each previous step and generate alternative sampling and analysis pathways and data quality requirements based on the initial conceptual model. Refine the model and/or pathways toward collecting additional on-site data as new information is provided.

The DQO process is used to define the quantitative and qualitative criteria for determining when, where, and how many sample measurements to collect and at what desired confidence level. Because several different data qualities may be appropriate to answer the site-specific scientific and engineering questions that must be addressed, the term sufficient or acceptable data quality is meaningful only when the intended uses for the data are known. The intended use of the data today may be different from tomorrow. Therefore, it cannot be overemphasized that cost-effective site investigations are highly dependent on anticipating data usage during the life of the characterization-to-cleanup program.

Step 3: Develop Standard Operating Procedures. The next step in developing a dynamic workplan is to establish standard operating procedures (SOPs). SOPs for sample collection and analysis should be produced along with other SOPs required to answer site-specific questions, e.g., geophysical and hydrogeological surveys, etc. The SOPs should be developed by the core technical team and approved by the appropriate regulatory body prior to initiating field activities. The field methods should be "performance based" and provide data of sufficient quality to meet the DQOs, see Section 4. The USEPA is encouraging the use of field analytical technologies and methods to expedite hazardous waste site investigations and cleanups in Superfund, RCRA, and Brownfields[5]. Because these technologies and methods may not be amenable to typical CLP or SW846 methods, QC procedures or data reporting formats, supporting data produced from the proposed field techniques should be provided to document data quality. Note that CLP and SW846 methods are not always required by the EPA to generate data.

Step 4: Develop Data Management Plan. Critical to the success of the dynamic process is the ability to manage and easily use all of the data produced in the field. Data integration (chemical, physical, geological, hydrological), sampling, and analysis protocols should be incorporated into

[5] May 1, 1996, Federal Register 61FR 19431-19463.

an overall data management plan. Protocols for sample logging, analysis, data reduction, and site mapping should be established. Several different organizations may be involved in this process. The data management plan should be established with rules and responsibilities defined prior to mobilization for the collection, assimilation, and presentation of the field generated data. As an example, computers housed in the sample receiving, organics, and metals analysis laboratories can be electronically linked through Ethernet connections to the data management trailer on site. Sampling logging information and the results of the analysis can be managed through a Laboratory Information Management System or through the use of spread sheets. The data can then be downloaded to a computer containing site visualization software for conceptual model update and review. In this manner, contaminant profiles are more easily understood facilitating the on-site decision making process.

Step 5: Develop Quality Assurance Project Plan. This document contains the sampling method, analytical procedures, and appropriate quality assurance (QA) and quality control (QC) procedures. Quality assurance/quality control (QA/QC) defines the responsibility of the technical team and regulators. It describes the procedures to be used to monitor conformance with, or documentation and justification of departure from the SOPs. The overall goal is to ensure that data of known and adequate quality have been produced to support the decision making process. Again, data of varying quality can be produced to support a range of activities from sample collection to risk assessment.

Step 6: Prepare Health and Safety Plan. Finally, a health and safety plan is produced as part of the Dynamic Workplan/Adaptive Sampling and Analysis project. DQOs should be established for the field analytical tools used to monitor worker and community safety and should be presented in the health and safety plan.

After all field organizations have mobilized and all analytical instruments have been calibrated, it is recommended that a dry run be made to ensure that all participants understand their respective roles and that the quality control (QC) systems from sample collection-to-analysis-to-site contaminant visualization are well-understood and can be easily implemented. On-site data verification may also be desirable for projects of large scope and duration.

3.1 Adaptive Sampling and Analysis Strategy

Figures 3 and 4 illustrate the adaptive sampling and analysis strategy for a hypothetical soil screening site investigation aimed at determining contaminant risk to ground water and human health. Figure 3 depicts the decision making flow chart for the investigation. Figure 4 describes the change in analysis based on what is found at the site. Once the initial sampling data (Round 1) is obtained the conceptual model is evaluated for accuracy. Typically, several sampling rounds are required before confidence in the conceptual model is obtained. The number of sampling rounds, made during the same mobilization, is dependent on the DQO specifications for confirming the absence of contaminants in areas thought to be clean (candidates for no further

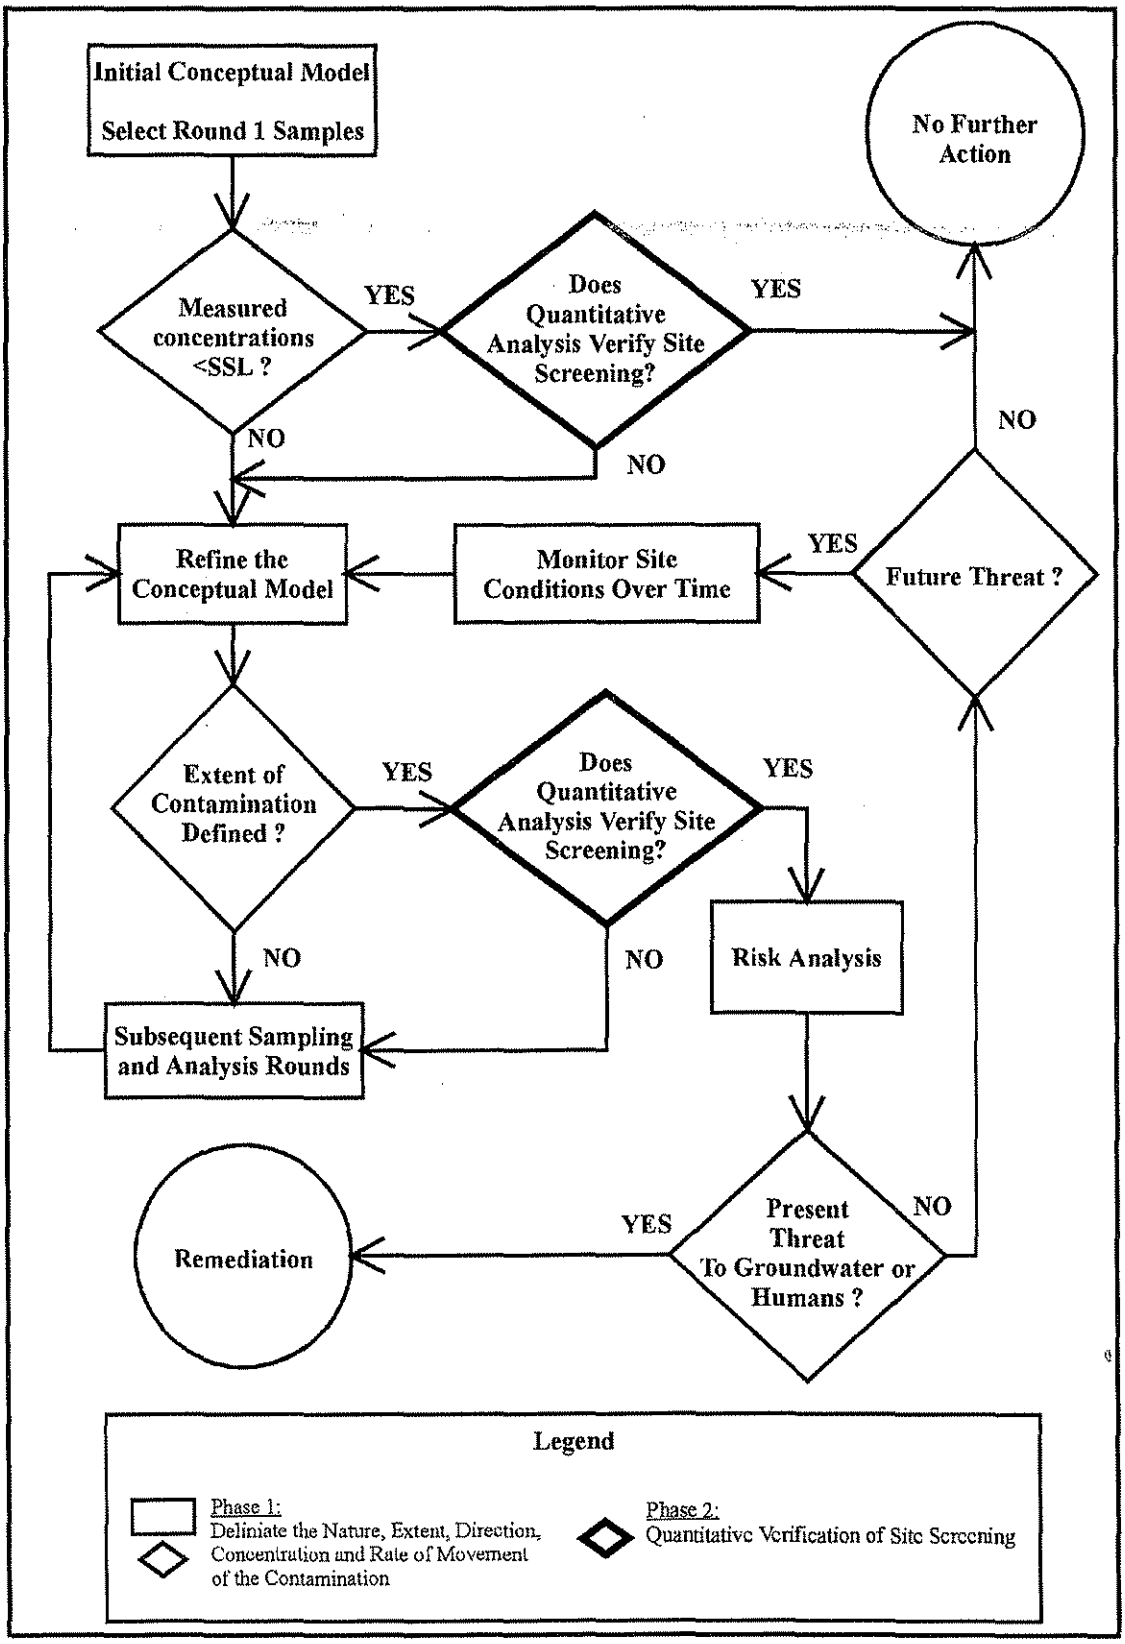

Figure 3. Adaptive Sampling and Analysis Flow Chart

action) *and* for determining the extent, direction, concentration, rate of contaminant migration, volume of contaminated soil and its risk to ground water and human health. Once the soil contamination profile objectives have been met and a verified conceptual model is produced, the data should be capable of delineating whether a particular area of investigation falls within three categories, namely:

- the site is clean or poses acceptable risk - no further action required
- the site is highly contaminated and well above action levels for acceptable risk - remedial action begins
- the site poses marginal risk - cost/benefit of an immediate cleanup not warranted, monitor for future action.

In the example provided, Round 1 samples are analyzed for the full Contract Laboratory Program (CLP) Target Compound List for volatile organic compounds (VOCs), semivolatile organic compounds (semi-VOCs), and metals if no prior field studies have been made. Target compound analysis is then performed for those contaminants found in each subsequent sampling round. As the analyte list decreases, more samples may be analyzed during the workday. Following the decision making logic through to completion, if site samples contain no detectable contaminants above the Soil Screening Levels (SSL) established for the site, site verification is made based on quantitative field analytical measurements. Several outcomes are possible. First, if the quantitative data verifies the field screening data and the data supports the conceptual model, no further action should be required at the site. Second, the comparison between field screening and quantitative measurements are within the site-specific DQOs for the data but the results do not support the conceptual model. In this case, additional sampling rounds are required to refine the model. Third, the comparison between quantitative and screening data fall outside of the acceptable DQOs, reassessment of the field screening tool is then required.

Following the alternative pathway, i.e., site screening measurements result in contaminant concentrations greater than the SSL's, sampling continues and the conceptual model is refined until the site-specific DQOs are met. The findings from the site screening effort are again verified by quantitative field analysis. Once the site data and conceptual model are verified, risk-based decision making occurs with respect to human health and the environment: that is, remediate or monitor for a future threat. At this point, new workplans must be produced to address site remediation or long-term monitoring needs. It should be pointed out that not all present or future threats will necessarily lead to a cleanup remedy. For example, the contamination may be technically impracticable to cleanup (dense non-aqueous phase liquids in bedrock) or natural attenuation may be proposed for the site.

Rather than relying on fixed grids, sampling is directed by geostatistical sampling tools that can predict where the next round of samples is collected. Because quantitative measurements are made on-site, greater confidence should be obtained in the sampling program. Phase 2 in Figure 4 illustrates one approach for verifying the site screening results. Recall that screening, semi-quantitative, or quantitative data can be generated in Phase 1 to develop the site model. If screening quality data, e.g., enzyme kits, is generated then more quantitative field, analytical data

should be produced to verify the results from the site screening phase. The number of locations within and surrounding each contaminated and non contaminated area as well as the number of depth samples at each location should be determined by the core technical team. An example is provided in the figure. The purpose of Phase 2 is to test the model and to verify the analytical results.

In an adaptive sampling and analysis program, contaminated areas are more heavily sampled than in traditional site characterization studies. Therefore, if semi-quantitative or quantitative field analytics is performed, no additional "quantitative" data may be necessary other than what is typical to verify data from one fixed-based laboratory versus another. Rapid, 5 to 15-minutes per sample, measurements should provide the majority of analyses during Phase 1, with 10% to 25% of these samples analyzed quantitatively in Phase 2. Off-site laboratory analysis should be performed only when on site quantitative analysis is not possible or cost-effective (Phase 3).

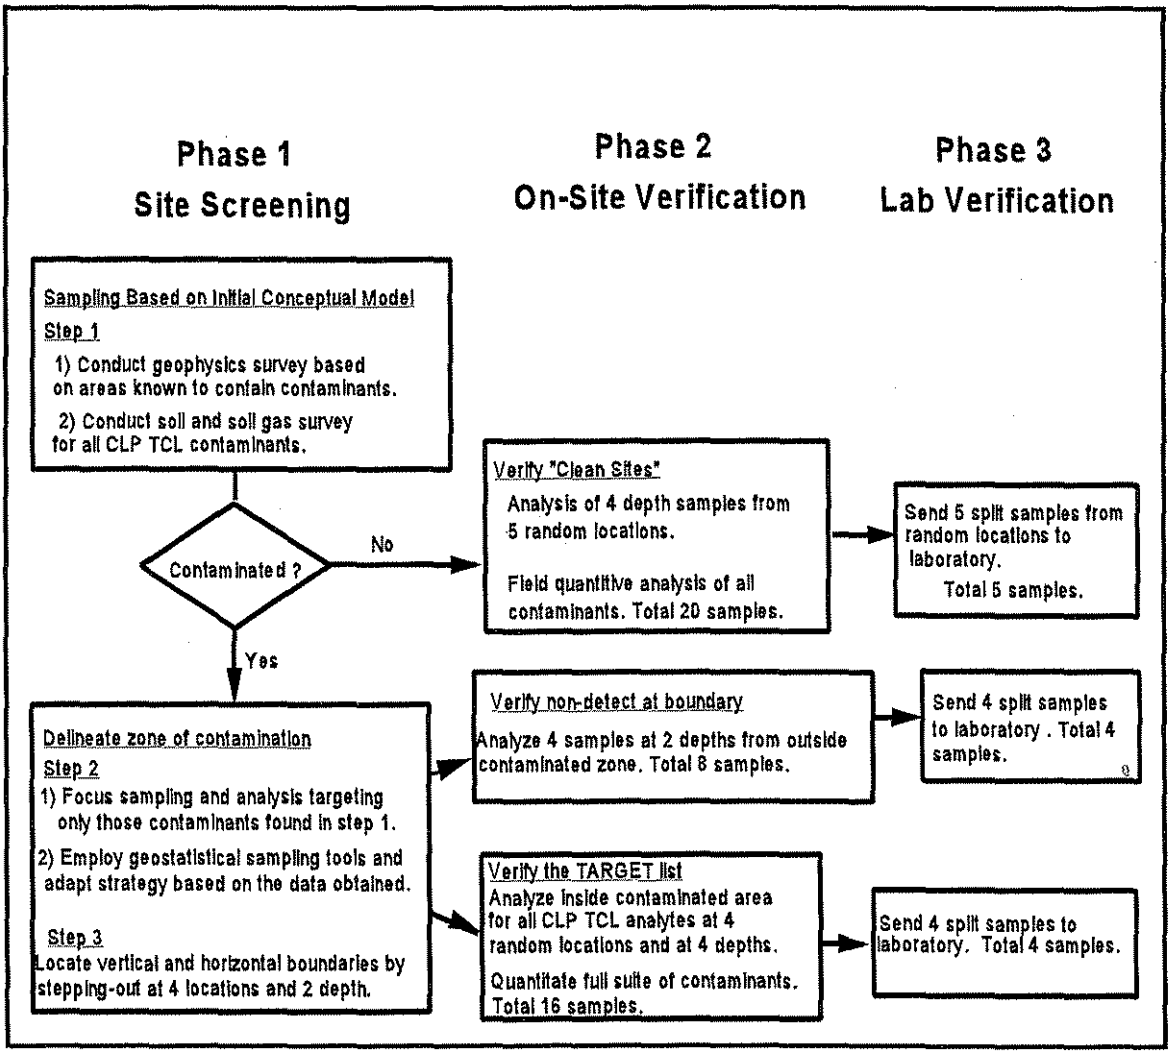

Figure 4. Example of Sampling and Analysis Flow Chart

Field results will differ from off-site laboratory results for VOC contaminated soil samples, with field measurements generally producing higher measurement concentrations because of analyte loss during off-site sample transport and storage. Care must be taken when these types of comparisons are made. Because site investigation and cleanup decisions are made based on field data, off-site laboratory analysis should be performed on no more than 10% of the samples analyzed quantitatively in the field. Field techniques that produce different data quality with the same instrumentation offer cost advantages over analytical techniques that produce either screening level or quantitative data[6]. Time and total project cost savings result when the sample load best matches the sample throughput rate of the instrumentation maximizing the effectiveness of field personnel and equipment, see Section 4.

Finally, field work begins based on the initial conceptual model. As new data are generated scientists and engineers may disagree over the direction(s) taken. Experience has shown that this will most likely occur based firstly on field discipline and secondly on stakeholder bias. One or more changes in direction should be proposed, with start/stop decisions delineated in the dynamic workplan. New results should refine the conceptual model and dictate future directions. Clearly articulated parameters with respect to sample number and DQO specifications obtained as a function of time should be identified in the workplan to set constraints on how long a particular pathway is followed before altering the investigation direction. One member of the siteowner technical team and one member of the regulatory oversight agency must have final site decision making authority. Site work stops when answers to the questions posed in the workplan meet site-specific confidence levels established as part of the DQO process. To ensure that site-specific goals have been met, the project team should statistically evaluate the results of its findings[7]. An adaptive sampling and analysis program focuses staff, equipment, and financial resources in areas where contamination exists while providing a cursory inspection in areas that pose no or little risk to human health and the environment.

4.0 Introduction to Field Analytics

The selection of field analytical methods is critically dependent on the need to make decisions in the field rapidly. Field analytical techniques should be capable of providing data from minutes to tens of minutes. They should have documented measurement sensitivity, precision, and accuracy to meet site investigation and cleanup DQOs. The simpler the technique the more likely it will be used in the field. Field instruments must be transportable, operate under adverse conditions, and provide improved cost/benefit over laboratory analysis. For projects of short duration and low sample volume, staff and equipment mobilization expenses may make field analytics a cost-prohibitive option. In addition, if quantitative measurements are required for all samples, field analytics may not provide a cost-effective means for obtaining site data. Rarely is this the case. Almost all projects will require screening or semi-quantitative data during the field

---

[6] B. M. Abraham, T-Y Liu, and A. Robbat, Jr., Hazardous Waste & Management, 10, 461-473, 1993 *and* K. Jiao and A. Robbat, Jr., J. of AOAC International, 79, 1996.

[7] Guidance for Data Quality: Practical Methods for Data Analysis, EPA QA/G-9 EPA/600/R-96/084, July 1996.

screening phase of the site investigation. Even short projects of one to three days, where six to twelve samples per day may be collected, will benefit from field measurements. For example, head space gas chromatography (GC) can be simple and fast for the analysis of VOCs in soil and water samples during underground storage tank removal or well installation and monitoring. Enzyme kits can provide rapid detection of polychlorinated biphenyls (PCBs) or explosives during site characterization or remediation. Field instrumentation, such as in situ fiber optics and electrochemical sensors or portable GCs can be used to provide a security system to monitor underground subsurface contamination migration, process control, or fugitive emissions during site cleanups or long-term monitoring operations.

Field analytics can be routinely used to monitor worker and community health and safety during site investigations and cleanups. For example, the protection of workers from exposure to hazardous substances during sampling is of primary concern. In this case, sampling speed and limited sample handling is an important aspect of the measurement process. The sampling and measurement methods must be suitable to meet guidelines set forth by the National Institute for Occupational Safety and Health.

4.1 Field Measurement and Contaminants of Concern

The action level (or level of concern) defines the contaminant concentration needed to produce useful data to answer site-specific scientific and engineering questions. The selected field method must demonstrate method detection limits below the action level established for the site. The action level defines the concentration at which decisions can be made, including:

- nature and extent of contamination, i.e., field data supports the overall site investigation
- risk to human health and the environment, i.e., field data provides input into baseline risk assessment process
- achievement of cleanup objectives, i.e., field data supports site compliance with regulatory-imposed concentration levels

As an example, the EPA has compiled a list of contaminant soil screening levels for land usages based on different risk factors. These generic soil screening levels take into account the natural attenuation processes for the migration to ground water pathway(s) that can reduce contaminant concentrations in the subsurface. To insure that the field analytical instrumentation and methods selected in the workplan are amenable to a given site, site-specific method detection limit studies should be performed for each class of contaminants (e.g., VOCs, semi-VOCs, and metals) from soil obtained from the site prior to the field investigation. This will help to determine whether matrix interferents or target compounds mask (e.g., portable GC) or cross-react (e.g., enzyme/wet chemical kits) with targeted organics or metals (e.g., by electrochemical detection).

4.2 Field Analytical Techniques

Field analytics can be divided into two categories: real-time and "near" real-time measurements. Real-time measurements include those techniques that provide instantaneous analysis without the need for sample pretreatment. Examples include ion selective electrodes, fiber optic sensors, hand-held gas monitors, direct measuring GC's, and portable x-ray fluorescence (XRF) instruments. With the exception of XRF, these tools are typically used as continuous or in situ monitors for either gaseous or liquid streams.

Near real-time measurements typically include the more quantitative analytical techniques. They generally require some sample pretreatment prior to analysis of complex samples. These techniques include wet chemical and enzyme immunoassay kits; GC with a variety of non-specific detectors such as photoionization (PID) and flame ionization (FID), class-selective detectors such as electron capture (ECD for PCBs and chlorinated pesticides) or chemiluminescence (CD for nitrated explosives), and compound-specific detection by mass spectrometry (MS for identification of individual organic compounds); total petroleum hydrocarbon (TPH) analyzers; *and* inductively coupled plasma/optical emission spectroscopy (ICP/OES); XRF; and anodic stripping voltammetry for metals analysis. The size and experimental operating features dictate whether they are classified as field portable or transportable (laboratory-grade) instruments. For example, portable GCs are typically small in size, can operate off batteries but have ovens that cannot be temperature programmed (isothermal operation) or have slow temperature program ramps from ambient to 200 ^{0}C.[8] In either case, these GCs are best suited to qualitative analysis of VOCs. In contrast, GC/MS instruments require a generator or a line voltage power source, but can produce quantitative analysis of VOCs and semi-VOCs in the field.

In many instances, it is not necessary to have quantitative data for every sample during PCB, PAH, or explosives soil remediation. For example, when excavating soil, measurement accuracy can be as high as 40-70% as long as measurement precision is known. Enzyme kits and rapid screening GC with ECD, FID, or MS can provide this level of data quality. Quantitative analysis, on the other hand, is needed only for the pit closure samples to verify that the cleanup DQOs have been met. Field GC/MS can provide the necessary measurement sensitivity, precision, and accuracy to meet most site-specific cleanup DQOs. Similarly, VOC soil and water analysis by rapid screening GC with ECD/FID or MS is sufficient to determine vadose zone and ground water contamination profiles. More quantitative GC/MS data are required to determine the threat to ground water and the associated risks to human health and the environment. Performance-based methods can provide maximum flexibility to meet site-specific data needs.

A considerable amount of field analytical methods are available. Not every field method is amenable to the full range of environmental contaminants. Some are selective by design (enzyme and wet-chemical kits), while others are limited in scope (portable GC and XRF) or by media type (fiber optic, acoustic wave, and electrochemical sensors). Sample throughput rates in the field can also limit the effectiveness of field analytical measurements. Careful consideration should be given to these issues before selection of field analytical techniques or methods. The amount of sample preparation prior to analysis will determine the sample throughput rates that can be achieved. Experience has shown that field GC/MS can provide both screening and

---

[8] Analytical Chemistry, 69, 195A-200A, 1997.

quantitative data for the full range of organics depending on the sample introduction system and data analysis software used. Data quality and throughput rates must be determined before the decision is made as to which field analytical technologies or methods are appropriate. An initial documented statement for the end use of the data incorporated into the data decision process will ensure that inappropriate data uses do not occur.

4.3 Sample Throughput Rates and Analytical Properties

No one laboratory technique or method is universally accepted for all EPA listed organic or inorganic contaminants. The selection of field methods for site characterization and cleanup depends on the material to be examined, contaminants and action levels of concern, QC requirements, sample throughput rates, and cost. Selection of field methods also depends on the type of data quality required to answer site-specific questions. It is important to have a clear understanding of the particular analytical properties required to meet site-specific DQOs and how the economic considerations of a given analytical problem affect some properties over others.

Accuracy and Representativeness are two key attributes of data quality. Accuracy refers to the closeness of the result between the measured and actual ("true") analyte concentration in the sample. Accuracy can be calculated based on the degree of agreement between the observed value and the accepted reference value. Commercially prepared standard reference materials (SRM) or site-specific SRM's are often used to determine accuracy. Representativeness is defined as the consistency between the result and the measured sample as well as between the result and the definition of the analytical problem. Representativeness is the degree to which data accurately and precisely represents the frequency distribution of a specific variable. Measurement accuracy can be influenced by the required measurement sensitivity, selectivity, and precision whereas representativeness is affected by sampling location exactness and sample homogeneity consistency. The influence of sampling on analytical quality is, overall, crucial. For example, blood-sugar from a diabetic more than 1-hr after a hypoglycemic attack is not representative of the blood-sugar concentration at the time of the attack. Likewise, collecting soil samples two feet apart and expecting one of the samples measured by the field laboratory to be representative of the other sample analyzed by either the on-site or off-site laboratory is unreasonable. No other analytical property can be justified without representativeness. Because of subsurface soil inhomogeneities, collecting the many statistical samples necessary to gain the confidence needed to delineate the extent, direction, concentration and rate of contaminant movement is generally too costly in the traditional site investigation approach. The adaptive sampling and analysis strategy helps to focus the sampling effort in areas where contamination has been identified which, in turn, results in more data produced in the areas where it is needed. Nonetheless, the analytical measurement process is most often the bottleneck that controls the rate of the site investigation when compared to sample collection.

Assuming representative samples have been collected, measurement accuracy is directly dependent on the relationship among three key analytical parameters: precision, selectivity, and sensitivity. Accurate results cannot be obtained unless the measurement technique produces selective detection and adequate sensitivity. Selectivity refers to the instrument's or method's ability to respond to target compounds in the presence of nontarget sample constituents. For

example, if the analytical technique responds to the presence of matrix interferents or cross-reactive target compounds, measurement identity is affected and thus, accuracy. Moreover, if the analyte concentrations in the sample are at or just below the method detection limit, the measured concentrations may be inconsistent (precision). Measurement precision is the degree to which a set of analyses of the same parameter conforms to itself. To achieve unambiguous analyte identification and the desired method detection limit, extensive sample preparation procedures may be required to remove matrix constituents, dilute, or pre-concentrate the sample extract. These additional steps lengthen the overall time of the analysis (sample throughput rate).

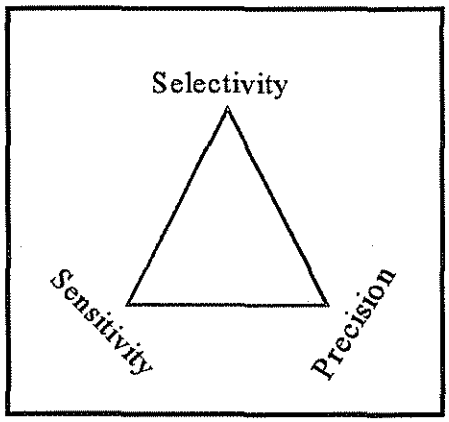

Figure 5. Data Attributes

Generally, as one property of the equilateral triangle is improved, one or both of the remaining analytical properties can become distorted. For example, increasing the number of sample preparation steps prior to the analytical measurement can result in loss of analyte, which, in turn, can influence measurement sensitivity and thus, accuracy (false negative). Another example is the detection of nitrated explosives by selective reagents such as enzymes. Field-practical enzyme immunoassay kits can significantly reduce the time of analysis over laboratory high performance liquid chromatography (HPLC) methods by eliminating the need for sample cleanup procedures. False positive detection is possible, however, due to cross-reactivity with other nitrated organic compounds that might be present in the sample. Although advancements in analytical instrumentation, sophisticated spectral deconvolution software routines, and compound-specific reagent chemistry have increased laboratory productivity, sample throughput rates and data quality are greatly influenced by the triangular interactions among selectivity, sensitivity, and precision. As increasingly more stringent measurement accuracy is specified, sample throughput rates decrease. For example, several published reports document the wide range of measurement precision and accuracy that is obtained when employing EPA method 8080 (20-min/sample) as compared to the more comprehensive congener-specific (90-min/sample) analysis for PCBs.[9,10,11]

The relationship between sample throughput rate, data quality, and field investigation costs can be viewed as follows. Assume a 10-hr workday with two hours set aside for lunch, daily meetings, instrument maintenance and lab cleanup. Also assume that each analysis requires a 5-min cycle time before the next sample can be analyzed and that any sample preparation procedures that might be necessary to remove nontarget matrix interferences occur separately from the analysis. Table 1 summarizes the relationship between number of samples that can provide information about the site and the number of QC or re-analysis samples required to

---

[9] R. Eganhouse, and R. Gossett, Anal. Chem., 63, 2130-2137 (1991).

[10] D. Kimbrough, C. Rustum, and J. Wakakuwa, Analyst, 119, 1277-1281 (1994).

[11] G. Frame, J. Cochran, S. Bøwadt, JHRC., 19 657-668 (1996).

determine data quality as a function of sample throughput rate. Assume that in this hypothetical site investigation 300 soil samples are analyzed for PCBs at a soil screening level of 0.5-ppm to determine risk to ground water.

Table 1. Number of Samples Analyzed per Day

	TDGC/MS or Enzyme Kit 10-min/sample		EPA method 8080 20-min/sample	
Total Site Samples	300	300	300	300
Site Samples Analyzed Per Day	22	18	14	10
Site Samples Re-analyzed	3	5	0	2
Blanks	2	2	1	2
Replicate Analysis	2	3	1	2
Accuracy (SRM)	1	2	1	1
Initial/Final Calibration	2	2	2	2
Total Analysis/Day	32	32	19	19
Total Field Days	14	17	22	30

The number of field days needed to complete the site investigation presumes no loss of time for instrument breakdown, repair and/or re-calibration. If, for example, five samples are re-analyzed rather than three due to matrix interferents, detector overload, or frequency of field duplicates *and* three samples are analyzed to determine measurement precision and accuracy, a total of 17 site samples can be analyzed per day as compared to 22 for the 10-min analysis. Increasing the number of quality control or re-analysis samples decreases the number of site samples that can provide information about the site. A total of 18-days will be needed to complete the project as compared with 14-days when the sample throughput rate is 10-min/sample.

When analyzing soil samples by EPA method 8080 in the field, adding additional non site samples will result in the project being completed in 30-days versus 22-days. Apparent is the fact that the sample collection and field analysis rates must be matched and that the site-specific DQOs be well-understood in the context of selecting appropriate field analytical techniques, methods, and QC procedures. If, for example, PAHs must also be analyzed, then no additional analysis time is required by TDGC/MS, i.e., PCBs and PAHs are analyzed simultaneously. When standard laboratory technologies or enzyme kits are employed two separate analyses must be performed,

increasing total project costs. Note that these field laboratory costs do not represent total project costs. For TDGC/MS analyses minimal sample preparation is required. Although the extraction and cleanup of 20 samples can be accomplished in two hours for method 8080, the field laboratory must accommodate the sample preparation station and staff to achieve reasonable throughput. Expenses for the sampling crew and core technical team plus any other field services work must be added to the overall project costs.

When the principal organic contaminants and action levels are known, the selection of the field method should be straightforward. In complex mixtures, indicator compounds such as trichloroethene, carbon tetrachloride, or benzene may be used as surrogates for fast GC analysis. Although dual detector GC with ECD and either FID or PID costs less than most field or laboratory GC/MS instruments and, until recently have been easier to operate, only MS can provide unambiguous identification of VOCs. Contaminant concentrations, persistence in the environment, mobility and/or fate can be estimated from the detection of indicator compounds. If the principal contaminants at a site are unknown, field GC/MS provides the only reliable means of determining compound identity and concentration. For VOC analysis, purge and trap GC/MS can be performed as easily in the field as in the laboratory.

For semi-VOCs sample preparation is the rate-determining step when analyzing the EPA listed target compounds. Semi-VOCs must be extracted from soil or water into an organic solvent prior to analysis. Depending on the complexity of the matrix, the extract is further separated into fractions that contain compounds of similar chemical characteristics (e.g., PCB/pesticides, PAHs, explosives, acids, base/neutrals). These fractions may require additional separation before analysis by GC with ECD or MS; HPLC with UV and/or fluorescence detection; or by class-specific reagent chemistry such as the enzyme immunoassay kits. Sample cleanup, pre-concentration and/or sample dilution add extra steps to the measurement process and must be factored into field-practical sample throughput rates. Until recently, on-site analysis has only been possible for PCBs (portable GC with electron capture detection) and explosives (enzyme kits) because of time and cost constraints (sample preparation) in the field. In contrast to class-selective analysis provided by these technologies, TDGC/MS can provide rapid compound-specific analysis of most semi-VOCs.

Similarly, the same rationale applies to the analysis of soil contaminated by metals. Portable XRF provides screening level to semi-quantitative data without the need for sample preparation. Sample throughput rates exceed the data turnaround times that can be produced by field-based ICP/OES instruments. ICP/OES, however, provides more quantitative data at concentrations several orders of magnitude less than XRF can achieve. In contrast, metals analysis by electrochemical detection (anodic stripping) requires sample preparation for soil samples but not water samples and is more selective and sensitive than portable XRF instruments. As discussed above, every analytical measurement requires a trade-off among the properties precision, selectivity, and sensitivity.

4.4 Site or Facility Requirements

The physical layout of the site must have access to deploy and setup a field laboratory if the field activities extend beyond a one-week period. The site or facility should have line voltage power or a dependable source of electricity from a generator if a wide variety of field instruments and computing power are required. Power from a generator must be put through a filter to smooth out voltage fluctuations to protect analytical instruments and computers. The mobile laboratory or facility must have the proper footprint to house instruments, hoods, computers, refrigerators, and staff comfortably. The mobile laboratory should be heated in the winter and cooled in the summer. For instruments like the ICP/OES, field laboratory temperatures must be climate controlled to within ± 10 ^{0}C to achieve high quality data. Proper ventilation must be provided to protect worker safety and to separate volatile vapors produced during sample preparation procedures from cross-contaminating the organics analysis laboratory.

Access to on-site field laboratories should be limited to authorized personnel. Instrumentation, laboratory equipment, and utilities should be maintained to perform the required operations. Safety equipment should be available and readily accessible, e.g., eye wash, fire blanket, safety supplies. All instruments and equipment should be kept secured when not in use. These are customary practices of fixed-based laboratory operations.

Design and implementation of sampling programs should address situations or conditions necessary for the controlled use, storage, and disposal of sample material (e.g., soil discard, purged waters), equipment decontamination residues and remnants of samples. It should also ensure that all activities that may impact environmental data are documented and recorded in field notebooks. Field analysis will result in the production of waste materials commonly handled in off-site laboratory operations. Regulatory acceptance of these waste handling procedures should be obtained and incorporated into the workplan.

4.5 Quality Control

Sampling designs should minimize integrations between high and low concentration areas, as well as minimize common utilization of equipment, instrumentation, and facilities. A formal active contamination control program should exist that minimizes the potential spread of contamination. The collection of grab samples, e.g., individual samples collected at a specific time and location, is acceptable for TPH, semi-VOCs, VOCs, and metals. Composite samples, collected by homogenizing a sample interval or sample collection from different locations and times, are acceptable for TPH, semi-VOCs, and metals. A composite sample is not acceptable for VOCs since analyte will be lost during the homogenization process.

Prior to selecting the field analytical methods, it should be well-understood by all stakeholders as to the quality of acceptable data that will be sufficient to address site investigation or cleanup DQOs. The DQOs will dictate the limits of measurement error, selectivity, sensitivity, and resolution for the field measurement and how these attributes affect sample throughput rates, the on-site decision making process, and cost. DQOs should, therefore, dictate acceptable limits for measurement precision, accuracy, representativeness, and completeness. Once these attributes

have been defined, specific QC criteria (e.g., initial and continuing calibrations, laboratory control check sample (SRM) accuracy), frequency (e.g., every 10th or 20th predetermined, random, or positively detected sample) and, number (e.g., n = 2 or more) of repetitive sample analysis can be determined. This information must be included in the site specific-SOPs.

Goals for precision and accuracy should be established in the dynamic workplan. For example, site characterization, treatability study, or remedial action measurement precision or accuracy may differ greatly and should be based on the criteria needed to answer project-specific questions concerning the stated problem(s). A well-defined description of precision and accuracy benchmarks, instruments, field methods, chemical standards and reagents employed should be documented.

Goals for data representativeness should be addressed qualitatively since sampling locations, depths, intervals, frequency of split sampling and of QC check samples may change in the field based on new directions and requirements.

Goals for completeness and comparability of investigation are achieved when the study goals have been met. An analytical measurement value is considered complete if QC results are within acceptable ranges. There can be no assurances that the data produced by standard laboratory methods and instruments are any better than the field data. Comparability should be based on how well the field and laboratory produced data within their respective internal and external QC checks *and* through some minimum level of field versus laboratory data comparison (e.g., ≤ 100% may be an acceptable error range for some types of data usages). Federal and state regulators, siteowners, and their consulting engineers have a tendency to be risk-averse. Typically, the highest level of data quality is requested whether needed or not. As shown in Section 4.3, improper matching of sample collection, sample analysis throughput rates, and site-specific DQOs can easily lead to inefficient sampling and analysis programs and thus, cost.

5.0 Dynamic versus Traditional Investigation and Cleanup Costs

Dynamic workplans provide the framework for collecting chemical, physical, geological, and hydrological data in one or two field efforts as compared to the phased engineering approach of collecting data then evaluate, collect more data then evaluate ... until sufficient information is obtained to meet the study objectives. Fixed-based (commercial) laboratories should be able to generate data of comparable (either screening or quantitative data) quality at lower per sample costs than field/mobile laboratories. Economies of scale should be more easily achieved by fixed-based laboratories since they are designed for mass production. However, steep sample surcharges (100-200%) are generally added to the base price if samples are moved up in the queue to obtain one to three day data turnaround times. Moreover, fixed-base laboratory sample analysis costs vary greatly between regional (typically local non Contract Laboratory Program) and national laboratories.

Comparing the selection of field instruments as a function of cost is difficult. Field instruments and methods should be chosen first to meet the data quality requirements and second based on their ability to match the rate at which samples are collected. To illustrate the first

point, assume that the 16 target compound PAHs and PCBs require soil analysis to determine risk to ground water and that the action levels for PAHs are between 2-ppm (benz(a)anthracene, dibenz(a,h)anthracene) and as high as 40,000-ppm (fluoranthene and pyrene) *and* 1-ppm for total PCBs. These values are based on the 20DAF soil screening levels (SSLs, USEPA 1996), which refer to a dilution-attenuation factor (DAF) of 20. The SSLs take into account the natural attenuation process for the migration to ground water pathway that can reduce contaminant concentrations in the subsurface. Assume that the action level for the site has been established at one-half the 20DAF. For PAHs and PCBs these values are 1-ppm and 0.5-ppm, respectively. The method detection limit (sensitivity) has been determined at 0.5-ppm for GC/FID and 0.3-ppm for TDGC/MS.

Table 2 lists site-specific action levels for the hypothetical site investigation along with the data quality attributes, sample analysis, and the total number of samples analyzed per day throughput rates for field GC/ECD, TDGC/MS, and enzyme kit analyses. Tables 1 and 3 illustrate the impact of sample analysis rate and the number of site samples that can be analyzed per day. It may be necessary to make trade-offs among the data quality attributes of selectivity, sensitivity, and precision in conjunction with sample throughput rates to meet the site-specific DQO's and action levels *and* to provide a cost-effective field analytics program. This type of review should be made to insure that the selected field technology meets the site-specific DQOs established for the investigation or cleanup verification program.

The second point is not a trivial or obvious statement. If sample analysis lags behind sample collection, sample collectors and decision support staff sit idle waiting for data to be produced. On the other hand, if sample collection is operating below capacity, analytical instruments and field-laboratory personnel sit idle. In both cases, site investigation efficiency and cost is lost. Therefore, it is essential that the analytical team member play an integral role in designing the sample collection program. Moreover, combining field screening and on-site quantitative analysis into the program should increase the total number of samples analyzed while decreasing the number of samples sent off-site for traditional laboratory analysis.

Table 3 summarizes the field and laboratory sample charges and data turnaround times for the analysis of VOCs, PCBs, PAHs, explosives, and semi-VOCs. Shown in the Appendix are assumptions and costs used to determine the TDGC/MS, portable GC, and enzyme/colorimetric kit per sample charges. Commercial laboratory charges vary widely depending on the size and revenue amount of the laboratory and the number of national programs the laboratory participates in (e.g., Contract Laboratory Program, U.S. Army Corps of Engineers, HAZWRAP, and state certified programs). Field analytical technologies can provide analyses comparable in cost to regional or local laboratories employing EPA standardized methods with same or next day data turnaround times as compared with 14 to 35-days by commercial laboratories. Field analytics compete best when total project cost is considered and when it is incorporated into the Dynamic Workplan/Adaptive Sampling and Analysis Program. Cost savings can be realized when:

- sample selection and locations are optimized. Increased sampling efficiencies result in more targeted sample collection efforts minimizing the handling of samples that provide little value toward answering site-specific DQOs - faster site characterizations and verification of cleanup.

- the identity of the contaminants becomes known. Increased field analytical productivity is obtained when the type of analysis performed is more targeted resulting in more samples analyzed per day - faster site characterizations and verification of cleanup.

- more data are produced in less time. More informative decisions are made that improve the site delineation process, i.e., the separation of highly contaminated areas from non-contaminated areas - better site characterizations and verification of cleanup.

- a more detailed picture of the site is obtained, viz., the nature, extent, direction, concentration and rate of contaminant movement. Increased confidence in evaluating the risk to human health and the environment results - better site characterizations and verification of cleanup.

- more efficient utilization of human and financial resources is obtained. Increased project efficiencies lead to more data obtained at lower total project costs - cheaper site characterizations and verification of cleanup.

The rationale for selecting an adaptive sampling and analysis program should be based on the inherent efficiencies obtained when decisions are made in the field and the overall total project cost savings that can accrue.

Table 2. Comparison of Field Technologies for PCBs and PAHs

Polycyclic Aromatic Hydrocarbons					Polychlorinated Biphenyls

Appendix

Field Analysis Costs

Table 4 illustrates the per sample costs for field-based TDGC/MS, GC with PID or ECD, and wet chemical or enzyme kit analysis. In the cost example, a Hewlett Packard GC/MS (model GCD) was modified to introduce samples via thermal desorption (TD), with the data analysis accomplished by the Ion Fingerprint Detection™ (IFD) software. Field GC/MS instruments such as the Viking Instrument, ~ $120,000 when fully equipped, will add $5.50 to the GC/MS sample cost shown in the table. The TDGC/MS with the IFD software can provide simultaneous detection of PCBs and PAHs in complex petroleum contaminated soil samples in 10-min. The Photovac GC/PID can provide full VOC analysis in the field. As discussed in Section 4, photoionization (PID) and electron capture (ECD) detectors provide qualitative compound-specific information as compared to the MS. These GC detectors can not provide unambiguous compound identification but can provide rapid field screening analysis of VOCs. The cost of a field-based GC/ECD has also been estimated for PCB analysis. The enzyme or colorimetric kit costs shown in the table have been calculated based on an average per kit price that assumes 40 analysis per calibration for either the Ensys or Ohmicron kits. Sample analysis of less than 40 samples per calibration will result in increased sample costs.

The cost analysis is based on a one time purchase of capital equipment and includes any modifications that are required to produce high throughput field analysis; a vehicle for field transport of staff, instrument and supplies; and generator for power. Annual operating costs assume a total of 4,500 soil samples will be analyzed over a 180-day field season by two chemists. This represents an average of 25 samples analyzed per day. Since nearly 70% of the cost to provide service is in salary any additional field days will reduce the per sample cost, while booking work for less than the assumed 180-days will increase the respective sample analysis cost. Finally, the per sample cost was calculated over a five year period. The calculation takes into account the time value of money based on present value of future costs to provide the service. It ignores inflation and assumes a 4% discount rate. Details of the capital purchases and annual operating costs can be found in Tables 5 and 6. Although commercial laboratories provide volume pricing, no one project or account will dramatically affect the laboratory life-cycle per sample cost. Included in the commercial laboratory per sample charges are costs for staff, equipment, supplies, space, management, accounting, marketing and sales. An industry conservative 2.5 multiplier was used to estimate the field comparable per sample charges for each technology.

Table 4. Field Analytical Measurement Costs

	TDGC/MS	GC/PID or ECD	Enzyme Kits
Initial Capital Costs	$76,000	$47,500	$27,500
Total Annual Operating Costs	$178,828	$161,978	$283,595
Present Value of Life-Cycle Costs (assume 4% discount)	$903,890	$797,383	$595,699 (direct costs) $770,818 (kits)
Total Number of Samples Analyzed Over 5-years	22,500	22,500	22,500
Cost per sample analysis	$40	$35	$27 direct cost plus $34/kit
Total Sample Cost with 2.5 multiplier*	$100	$88	$102

INNOVATIVE TECHNOLOGY
Summary Report

Purpose of this document

Innovative Technology Summary Reports are designed to provide potential users with the information they need to quickly determine if a technology would apply to a particular environmental management problem. They are also designed for readers who may recommend that a technology be considered by prospective users.

Each report describes a technology, system, or process that has been developed and tested with funding from DOE's Office of Science and Technology (OST). A report presents the full range of problems that a technology, system, or process will address and its advantages to the DOE cleanup in terms of system performance, cost, and cleanup effectiveness. Most reports include comparisons to baseline technologies as well as other competing technologies. Information about commercial availability and technology readiness for implementation is also included. Innovative Technology Summary Reports are intended to provide summary information. References for more detailed information are provided in an appendix.

Efforts have been made to provide key data describing the performance, cost, and regulatory acceptance of the technology. If this information was not available at the time of publication, the omission is noted.

All published Innovative Technology Summary Reports are available on the OST Web site at http://OST.em.doe.gov under "Publications."

SECTION 1

SUMMARY

Technology Summary

Problem

In the DOE's Accelerated Clean-up Plan Cost Rollup by Category, over 1.34 billion dollars of the 9.7 billion dollar remedial action budget is allocated to remediation assessment studies. The baseline or traditional method of site characterization uses a phased approach consisting of multiple sampling events with most samples analyzed in the laboratory. Traditional site characterization procedures, conducted in a conservative regulatory environment, are usually effective but can be quite costly and time consuming.

How It Works

Expedited Site Characterization (ESC) has been developed, demonstrated, and deployed as a new time-saving, cost-effective approach for hazardous waste site investigations. ESC is an alternative approach that effectively shortens the length of the assessment period and may significantly reduce costs at many sites. It is not a specific technology or system but is a methodology for most effectively conducting a site characterization.

The principal elements of ESC are:

- a field investigation conducted by an integrated team of experienced professionals working in the field at the same time,
- analysis, integration and initial validation of the characterization data as they are obtained in the field,
- a dynamic work plan that enables the team to take advantage of new insights from recent data to adjust the work plan in the field.

The ESC methodology emphasizes the delineation of the hydrogeologic framework of the potentially contaminated site, followed by the delineation of the contaminant pathways and contaminant distribution, and the selection of the most effective measurement technologies. Explicit in the process is direct communication with regulators and stakeholders.

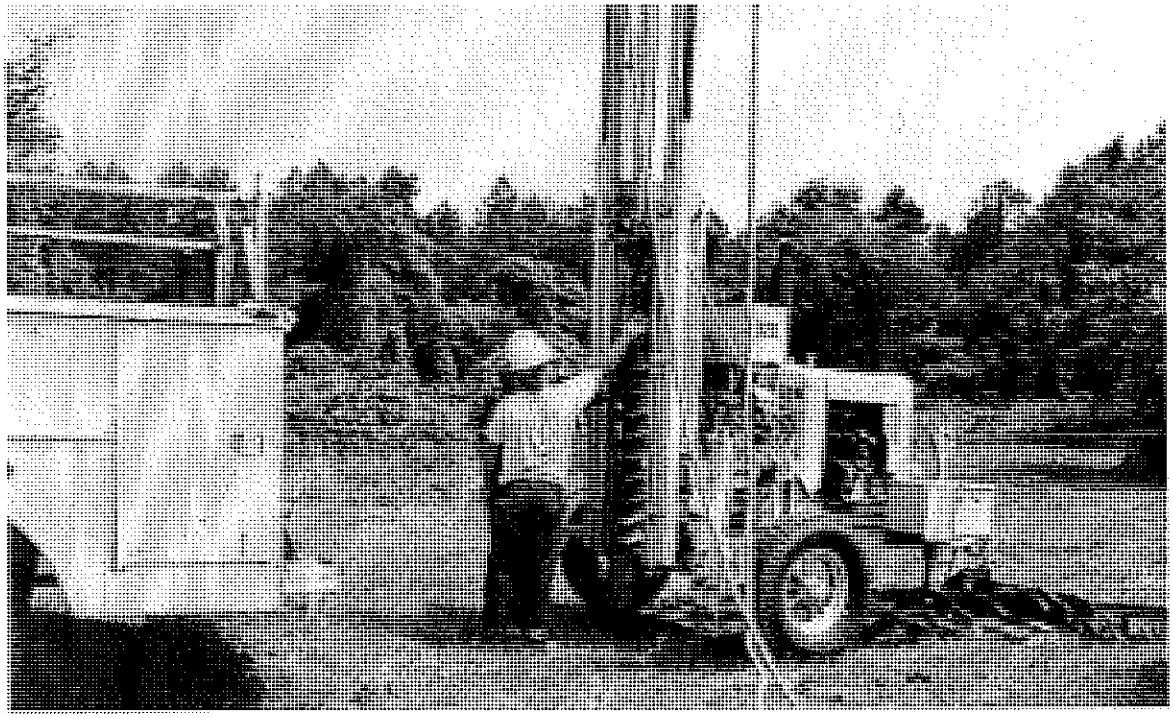

Figure 1. Immediate data analyses are completed using field mobile equipment as shown here at the Savannah River Site.

Potential Markets

Generally, the ESC methodology is most cost-effectively applied for:

- large-scale projects including
  - ◊ CERCLA (Comprehensive Environmental Response, Compensation and Liability Act, i.e., Superfund) remedial investigations (RI/FS)
  - ◊ RCRA (Resource Conservation and Recovery Act) facility investigations (RFI, CMS).
- other contaminated sites where the ESC process can be reasonably expected to reduce time and cost of site characterization when compared with traditional approaches.

Advantages over the Baseline

The advantages of ESC over traditional methods include:

- use of a wider variety of measurement methods
  - ◊ ESC investigations employ a diverse set of measurement techniques, with less reliance on traditional monitoring well data,
  - ◊ ESC investigations use more than one measurement to prove or validate each essential feature of the conceptual model,
  - ◊ ESC investigations employ innovative technologies where cost savings or data quality are improved.
- an improved rate of data integration; data are continuously analyzed and integrated into the conceptual model; the model evolves both during and between phases.
- a flexible, dynamic work plan that allows newly acquired data to improve the conceptual model, while impacting and optimizing subsequent characterization activities immediately (hours to days).
- potential cost savings are due to many factors
  - ◊ reduction in the number of data samples collected,
  - ◊ reduction in the number of monitoring wells installed,
  - ◊ reduction in the time required to complete assessment,
  - ◊ improved assessment accuracy, and
  - ◊ results that are more credible with regulators.

The target for DOE characterization cost savings in the 2006 Plan budget is $1.34 billion. If the Pantex ESC example documented in this report is representative, then its 50% savings translates into possible DOE complex-wide savings of $600-700 million through 2006.

Demonstration Summary

This report covers demonstrations that took place between 1989 and 1996.

- ESC methodology has been applied to a number of hazardous wastes sites within
  - ◊ the DOE complex (the Pantex Weapons Facility in Amarillo TX, the SLAPS Uranium Processing Site in St. Louis MO, the Savannah River Site in Aiken SC, the Central Nevada Test Area, the Painesville FUSRAP Site in Ohio),
  - ◊ at DoD facilities (Navy and Air Force),
  - ◊ at USDI (BLM) and USDA facilities,
  - ◊ and at commercial facilities in the U.S.and in Poland.
- ESC has been used to
  - ◊ delineate contaminant plumes,
  - ◊ verify hydrogeological site models,
  - ◊ delineate hydrologic systems under CERCLA RI, RCRA RFI, UMTRA, FUSRAP, and state regulatory programs at landfills, petroleum release sites, radioactively contaminated sites, gas manufacturing plants, and grain storage facilities.

- ESC projects have
  - ◊ included evaluation of pre-existing data and incorporation into expedited characterization efforts in the field,
  - ◊ generated technically defensible explanations of issues,
  - ◊ generated new types of data to assist with site model generation,
  - ◊ improved plume delineation and identified new aquitards,
  - ◊ characterized sites for rapid closure (no further action) saving significant money.

- DOE's CMST-CP funded development of an ASTM Guide for Expedited Site Characterization of Hazardous Waste Sites. The guide documents the implementation of ESC at DOE sites and is an excellent introduction to common sense, cost-effective characterization. This guide is available from ASTM, 1916 Race St., Philadelphia, PA 19103, 215 299 5480.

- ESC permitting has been accomplished on a case by case basis; several regulators in states and EPA regions where ESC has been applied have expressed willingness to discuss ESC with regulators in states where ESC is being proposed. ESC is being evaluated by the Interstate Technology and Regulatory Cooperation Working Group (ITRC) to expedite multi-state acceptance by regulators.

The OST reference # for Expedited Site Characterization is 77.

SECTION 2

TECHNOLOGY DESCRIPTION

Introduction/Background

Site characterization is an investigative process for developing an understanding of the extent and environmental impacts of contamination sufficient to assess the risk to humans and the environment. ESC is an alternative approach that shortens the assessment period and significantly reduces costs. It is not a specific technology or system but a methodology or approach.

- The ESC methodology emphasizes the delineation of the hydrogeologic framework of the potentially contaminated site, followed by use of that framework to guide the delineation of the contaminant pathways and contaminant distribution.
- ESC also emphasizes the selection of the most effective measurement technologies.
- The site understanding, or conceptual model, becomes the basis for determining the necessity of site remediation. Critical parameters for the design and optimization of the remedial system are also measured during site characterization.

Process Definition

Each site characterization is affected by unique aspects of the contaminated site, the regulatory perspective, and the capabilities of the characterization team. The ESC process has ten steps.

Step 1: Team Formation

A team of seasoned professionals is formed.

- The team is organized into a core technical team and project team. The core technical team consists of three to five experienced professionals who are knowledgeable of hydrologic, geologic, and contaminant chemistry systems. They plan, organize, and direct the investigation and are part of the assessment until it is completed. The core technical team leader is responsible for the overall conduct of the investigation. The actual measurements, data analysis, and support activities are accomplished by a larger project team. Project team members are part of the assessment only for as long as necessary to accomplish their specific activities.

- Members of the project team are selected from technical disciplines that are needed to analyze and integrate new data (for example, geology, geochemistry, geophysics, hydrology, computer science, contaminant transport, ground water modeling, risk analysis, regulatory compliance, health/safety, QA/QC, and analytical chemistry).

Step 2: Critical Evaluation of Existing Data and Development of an Initial Conceptual Model

The ESC team compiles and evaluates existing data to guide development of the initial conceptual model. Data inconsistencies and conflict are highlighted. A numeric quality level is assigned to all existing data. Some data are processed or reinterpreted if necessary. Data are integrated into an archive and referenced to the coordinate grid.

Step 3: Initial Site Visit: Meetings with Regulators and Site Owners

As a group, the core technical team visits the field site and walks the ground to meet with the site owner and regulators to discuss the ESC process and the essential issues the investigation should resolve.

- Operational, safety, security, and other site specific constraints relevant to the preparation of the work plan are identified.
- With the site owner and regulators, the ESC team determines essential data needed to address regulatory requirements.
- These discussions typically result in a definition of investigation objectives and identification of issues, for example, the list of analytes.

The site owner often arranges for the Core Technical Team to meet with the public and explain ESC.

Step 4: Initial Development of the Conceptual Model

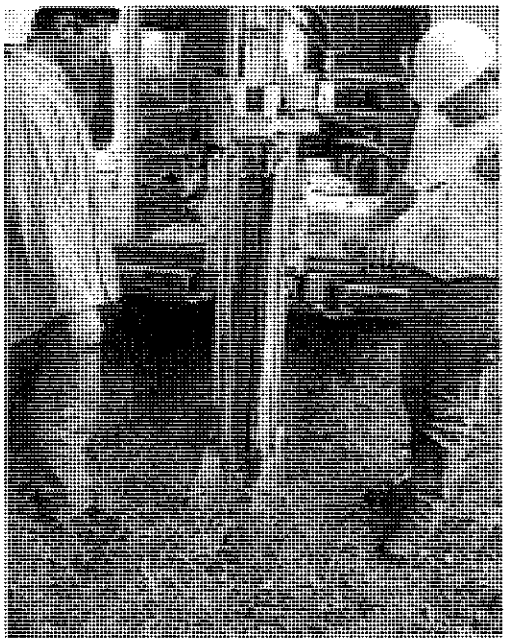
An initial conceptual model that is consistent with available site data and information collected during the initial site visit and that addresses all of the essential features required for risk assessment and remedial action decision making is developed by the ESC team.

- The model is often a set of hypotheses describing the essential features of the site that control the system of pathways between the likely source of contamination and all potential receptors.

Step 5: Identification of Measurement Options

In the ESC process, all of the measurement techniques that will effectively test the model are identified. ESC uses a diverse set of measurement techniques that test each essential feature of the conceptual model. As ESC measurement data need to be analyzed within hours of being taken, analysis systems (like analytical labs) are usually brought to the field.

Step 6: Formulation of a Dynamic Work Plan



A dynamic work plan that describes the field investigation plan is developed.

- Dynamic workplans define an area and depth within which the ESC team can adjust measurement parameters without needing to seek additional regulatory approval.
- Every element of an ESC work plan, including data collection and analysis, QA/QC and measurement techniques, is sufficiently robust that the plan can be adjusted without initiating the lengthy process of a formal work plan change.
- The work plan may propose several different measurement and data analysis techniques and the approximate order in which the measurements will be made.
- An ESC investigation will favor techniques that yield analyzed data rapidly, over techniques that require weeks or months to obtain results.

Step 7: Phase I field investigation

ESC field investigations are short, intense, and productive, and typically require two phases. Timely support from site personnel, logistical support personnel, and the project team is essential, because each element of an ESC investigation is critically dependent on all the other elements.

- In the Phase 1 field investigation, the team returns as a group to the site after the initial site visit.
  - ◊ The main purpose of this investigation is to test the accuracy of the initial conceptual model with respect to the system of pathways that contamination could travel from known and potential sources.
  - ◊ Many simultaneous measurements are made and samples are split to maximize the information yield.
  - ◊ Data are analyzed, digitally archived, and integrated into the investigation record as rapidly as possible.
- While in the field the team follows this established procedure:
  - ◊ Results are predicted and recorded in lab books before any measurement is made.
  - ◊ Measurements are made.
  - ◊ Data are analyzed.
  - ◊ Data are integrated into the site coordinate system for comparison with other data and the conceptual model.
  - ◊ Conceptual model is modified based on measurement results.
  - ◊ Subsequent measurements are selected to best test the updated conceptual model.
- The process is repeated until the field investigation successfully meets the established objectives and the conceptual model accurately and convincingly describes all the pathways of concern to regulators and the site owner.
- Although the system of pathways is emphasized, the Phase I field investigation also includes all easily– obtainable measurements and sampling that can contribute to the investigation.
  - ◊ Surface contamination measurements are often taken in Phase I.
  - ◊ Between phases, the results of measurements that could not be quickly analyzed are incorporated into the conceptual model.

Step 8: Phase II field investigation and initial report

The Phase II field investigation uses the conceptual model predictions of the system of pathways and contaminant source locations developed in Phase I to locate the contaminant plume. As in the Phase I investigation, the dynamic work plan emphasizes flexibility.

Step 9: Risk Assessment

Employing appropriate risk methodologies, the proven conceptual model may be used to prepare a risk assessment of the site contamination

Step 10: Final report

The conceptual model and risk assessment are summarized in an appropriate report format and delivered to the site owner. The team supports the site owner in presenting the report to regulators and the public.

SECTION 3

PERFORMANCE

ESC was first developed by Argonne National Laboratory (ANL) personnel in 1989 to cost-effectively characterize several U. S. Bureau of Land Management landfills in New Mexico. ESC has been applied at many sites by the ANL team and by a team from Ames Laboratory. The following describes the various technology demonstrations/deployments.

Client: USDI/Bureau of Land Management
Site Type/Size/Depth: 3 landfills ranging in size from 650' x 800' to 1,000' x 2000'
Location: New Mexico
Date: 1989-1991
Contaminant: Metals, VOCs, SVOCs, petroleum products
Regulatory Setting: CERCLA RI/FS
Problem or Objectives: Initial data indicated that the migration of contaminants to ground or surface water was likely.
ESC Results: ESC showed that the contamination present at the landfill was not migrating deeper that the upper few meters of soil. All 3 landfills were closed with no remediation and no requirement for continued ground water monitoring at a cost of $300,000 less than projected.

Client: USDA/Commodity Credit Corporation (CCC)
Site Type/Size/Depth: 20 former grain storage facilities, 800 x 1000 feet up to 23 square miles
Location: Nebraska, Kansas
Date: Ongoing
Contaminants: Carbon tetrachloride, chloroform
Regulatory Setting: CERCLA RI/FS (2 sites from the National Priority List (NPL)), Safe Drinking Water Act (SDWA)
Problem or Objectives: Carbon tetrachloride contamination of drinking water supplies was potentially linked to CCC former operations.
ESC Results: ESC streamlined the RI/FS process and generated technically defensible data for rapid remedial action decision making for 1/5 to 1/10 cost and 1/30 time of conventional methods.

Client: DOE
Site Type/Size/Depth: Zone 12 Pantex Plant, 1 square mile
Location: Amarillo, TX/ EPA Region VI
Date: 1994-1995
Contaminant: Explosive metals, fuels, chlorinated hydrocarbons
Regulatory Setting: CERCLA RI and RCRA RFI
Problem or Objectives: Previous RI had not generated technically acceptable explanation for contaminant distribution, migration pathways and potential for cross-aquifer contaminant migration.
ESC Results: Re-evaluation, interpretation, and integration of existing (pre-ESC) databases allowed for a streamlined field investigation that generated technically defensible explanation of all issues. The cost impact of this study is discussed in detail in Section 5 of this report.

Client: DoD/Navy
Site Type/Size/Depth: Closing marine air station, 3 square miles
Location: Western US/Region IX
Date: Ongoing
Contaminant: Fuels, solvents, oils, paints, pesticides
Regulatory Setting: CERCLA RI/FS
Problem or Objectives: Previous RI had not defined aquifer systems (including flow, number of aquifers, etc.), migration pathways, sources, or contaminant distribution.
ESC Results: Phase I investigation delineated hydrologic systems, including flow, number of aquifers, isolation of aquifers, and migration pathways. Phase II presently being conducted by a private sector firm.

Client: DOD/Air Force
Site Type/Size/Depth: Air Force base, 1,300' x 2,600'
Location: Southwest Region VI
Date: Ongoing
Contaminant: Trichloroethylene (TCE), 1,2-dichloroethene, carbon tetrachloride
Regulatory Setting: CERCLA RI, RCRA RFI
Problem or Objectives: The rapid transfer of ESC approach to a federal agency and contractor for interim corrective action measures selection.
ESC Results: ESC investigation ongoing.

Client: IA Department of Natural Resources
Site Type/Size/Depth: Former gas manufacturing plant, 3 acres, 50'
Location: Marshalltown, IA, EPA Region VII
Date: 1994 - present
Contaminant: Sixteen polyaromatic hydrocarbons (PAH)
Regulatory Setting: State regulatory program
Problem or Objectives: DOE technology demonstration that highlighted immunoassay testing, geophysical methods, five polyaromatic hydrocarbon soil extraction methods, percussive conductivity logging (ISSTime).
ESC Results: ESC investigation ongoing.

Client: DOE
Site Type/Size/Depth: SLAPS Uranium Processing Site, 52 acres, 65'
Location: St. Louis, MO, EPA Region VII
Date: 1994
Contaminant: Uranium, thorium, radium, radon isotopes
Regulatory Setting: Uranium Mill Tailing Remediation Act (UMTRA)
Problem or Objectives: Delineate extent of radioactive contaminants in surface soils; evaluate pathways to and extent of karst aquifer beneath uranium-bearing waste piles; determine thickness of aquitard located between two aquifers.
ESC Results: Microgravity and EM surveys were completed to map the thickness of the aquitard and the extent of karsting in the aquifer; geochemical dating of two aquifers was completed. These results assisted with the conceptual model for fate and transport of contaminants from the upper to lower aquifer at this site.

Client: DOE
Site Type/Size/Depth: Savannah River Site, D-Area Oil Seepage Basin, 10 acres, 65'
Location: South Carolina, EPA Region IV and South Carolina Department of Health and Environmental Control
Date: 1994-1995
Contaminant: Trichloroethylene (TCE), tetrachloroethylene (PCE), vinyl chloride, a-BHC pesticide, Sb, Be, Mn and As metals
Regulatory Setting: CERCLA /RI, RCRA/ RFI
Problem or Objectives: Primary objectives were to determine hydrogeology of the site, contaminants of concern, to delineate extent of groundwater contamination; and to assess risk of soil/groundwater contamination.
ESC Results: Contaminant plume would have been missed by originally proposed monitoring well locations; geophysical methods (GPR, EM, borehole logging, percussive electrical conductivity logging, and cone penetrometer) were used to identify two shallow aquitards that control the flow of the 13 contaminants of concern (VOCs, pesticides, and metals). The assessment/remediation schedule was cut by seven months as a result of this project.

Client: Polish government/DOE
Site Type/Size/Depth: Oil refinery, 15 acres, 60'
Location: Czechowice, Poland
Date: 1996
Contaminant: VOC's, 5 PAHs, RCRA metals
Regulatory Setting: Polish action levels
Problem or Objectives: Demonstration of site characterization technologies.
ESC Results: Demonstrated use of laser-induced fluorescence and Hg lamp with a cone penetrometer, immunoassay testing, percussive conductivity logging, horizontal drilling and sampling.

Client: Nevada Field Office/ Off Sites Program/DOE
Site Type/Size/Depth: Three underground nuclear test sites, 50 acres, 20'
Location: Central Nevada Test Area, Nevada
Date: 1997
Contaminant: Diesel/Motor Oil TPH, Total and hexavalent chromium
Regulatory Setting: Nevada DEP preliminary action levels
Problem or Objectives: Characterize surface and subsurface drilling mud pits and shaker pad debris areas with geophysical and percussive probing techniques and two mobile labs.
ESC Results: Found ten new areas of concern and one new COC; mapped distribution of all COCs at all sites in 22 day field effort.

Client: DOE/FUSRAP
Site Type/Size/Depth: 52 acres of potentially radioisotope contaminated surface from residual contamination on barrels shipped from Ontario Site.
Location: Painesville, Ohio
Date: 1997
Contaminant: Residues from extraction of uranium from pitchblende.
Regulatory Setting: State of Ohio, FUSRAP follows CERCLA procedures
Problem or Objectives: Characterize extent and type of contamination.
ESC Results: 52 acre site was successfully characterized in four weeks of field measurements.

SECTION 4

TECHNOLOGY APPLICABILITY AND ALTERNATIVE TECHNOLOGIES

Technology Applicability

The ESC approach is most appropriately used at the following types of sites:

- larger-scale projects, including CERCLA remedial investigations (RI/FS), and RCRA facility investigations (RFI, CMS).
- other contaminated sites where the ESC process can be reasonably expected to reduce time and cost of site characterization when compared with traditional approaches.

Generally, the ESC methodology may not be applicable at

- small petroleum release sites,
- Phase I real estate property transactions,
- sites where the contamination is limited to the near-surface and there is little likelihood for migration of contaminants into the ground water,
- sites where the cost of remedial action is less than the cost of characterization,
- sites where regulators may require long-term statistical monitoring of the site; a traditional approach involving grid-spaced monitoring wells may be more suitable,
- sites where existing statutes or regulations prohibit use of essential features of ESC.

Competing Technologies

Expedited Site Characterization is not the only streamlined characterization methodology currently in use. Scientists from industry, academia, and other federal laboratories have developed similar approaches.

- Baseline or traditional site characterization techniques:
  - ◊ Typically use a phased approach of data collection on a statistical basis or grid to develop a conceptual model of a site.
  - ◊ Each phase focuses on locating the contaminant plumes.
  - ◊ Each phase of the investigation follows a rigid pre-approved work plan and data are collected frequently by different subcontractors.
  - ◊ Data are analyzed and interpreted at the completion of each phase of work.

- The Observational Method is an investigative process developed and used in the 1920's to 1950's for geotechnical characterization of soils and geotechnical engineering design.
  - ◊ Characterization, design, and construction proceed hand-in-hand; as construction proceeds, observed changes in the soil system are used to modify the design.
  - ◊ A critical element of the method is an early assessment of most probable conditions.
  - ◊ Application to remedial investigation or characterization stage focuses on determination of general site conditions and identification of most probable conditions and reasonable deviations as the basis for a flexible approach to remediation design.

- Adaptive Sampling and Analysis was developed and used by DoD to characterize to determine the nature, extent and level of contamination present at a site.
  - ◊ This approach uses chemical analytical methods and on-site decision-making in the context of geostatistical models to guide sampling.
  - ◊ This approach is most applicable to characterization of near surface soil contamination.

- Data Quality Objectives (DQO) are a quality-management tool developed by the U.S. EPA, using a statistical approach to facilitate planning of environmental data collection.
  - ◊ This approach focuses on optimizing data collection and analysis so that the data are collected only to address the appropriate problems.

◊ This approach differs from ESC in that

- An optimal fixed number of measurements in a statistical framework is used.
- Information from the first set of measurements is usually not used to refine the next set of measurements.
- Chemical measurement of the contaminants of concern is the focus in contrast to ESC where an integrated understanding of the geohydrologic framework is determined prior to plume delineation.

- SACM and SAFER Processes were developed by the U.S. EPA (Superfund Accelerated Cleanup Model) and the U.S. DOE (Streamlined Approach for Environmental Restoration). They are complimentary approaches for speeding up CERCLA RI/FS projects.

  ◊ SAFER integrates DQO with the observational method.

  ◊ ESC can be easily incorporated into the characterization portion of SAFER to provide a robust, integrated geohydrologic model of the site in a reduced time.

  ◊ The use of ESC in SAFER and SACM would de-emphasize contingency planning due to the development of a robust and accurate site model during characterization.

Patents Commercialization/Sponsor

The ESC approach was originally developed by ANL, primarily for the USDA CCC for the characterization of former grain storage facilities. DOE through the CMST-CP funded development of an ASTM Guide titled "Guide for Expedited Site Characterization of Hazardous Waste Site" that is now provisional PS 85-96. The guide documents the implementation of ESC at DOE sites, and is an excellent introduction to common sense, cost-effective characterization at DOE sites. ANL and DOE have a trademark (QuickSite) on the application of ANL's ESC.

SECTION 5

COST

Introduction

Information in this section is summarized from a report prepared by Los Alamos National Laboratory (LANL) from a demonstration of ESC sponsored by DOE at the Zone 12 Pantex Plant in Texas (LA-UR97-2215). LANL was tasked to perform the cost analyses as an independent team for the DOE Office of Science and Technology. As part of this effort, LANL re-evaluated information presented in an earlier report evaluating the cost effectiveness of the application of ESC at DOE's Pantex Plant [LA-UR 96-2945). Although there are significant differences in the cost scenarios and conclusions presented by the authors in each of the studies, both studies showed a positive cost benefit from the application of ESC.

The main challenge in providing a robust cost analysis of ESC or any other technology is to establish a realistic cost scenario for both the baseline and innovative technology. For ESC, this is especially difficult, because the published case studies are speculative as to what outcomes would have been produced had the other approach been used.

The cost impact of ESC varies on a site-by-site basis. At some sites, the application of ESC will result in major cost savings relative to baseline methods, and at others, the cost of ESC will be comparable to baseline methods. The two major cost components of a completed site characterization study are costs associated with (1) drilling, sample collection, and sample analysis, and (2) labor.

Cost Analysis: A Case Study at DOE's Pantex Plant: Zone 12

At the DOE Pantex Plant in Texas, the distribution of contaminants and pathways for contaminant migration are complicated by the complex hydrogeology. The geological characteristics of the site include a perched aquifer at a depth of 250 feet and the 400-foot-thick Ogallala aquifer at a 450-foot depth. Prior to the ESC investigation, the U.S. Army Corps of Engineers (COE) had spent 2 years and $2.1 million completing the first of a proposed four-phase comprehensive traditional characterization effort, that was scheduled to last 5 years and cost $11.9 million.

Phase I of the COE effort included the drilling of 11 wells; the proposed additional phases called for installation of 43 additional wells. In contrast, the ESC investigation resulted in only four soil borings, one of which was later turned into a well, and nine cone penetrometer pushes. After the ESC team left the site, an additional 10 borings were made and 5 monitoring wells were installed to determine precisely what remediation efforts would be required to treat the contaminant plume.

Table 1 compares the number of penetrations estimated for completion of site characterization at Pantex. This table does not include the 11 monitoring wells drilled by the COE during Phase I. If the 11 Phase I wells are included, total penetrations for both methods would increase by 11. The main significance of this table is that the ESC approach resulted in installation of significantly fewer monitoring wells.

Table 1. Post-phase I Penetrations at the Pantex Plant

Type of Penetration	ESC (Actual)	Traditional (Planned)
Borings	13	0
CPT pushes	9	0
Wells (perched aquifer)	5	39
Wells (Ogallala)	1	4

Table 2 (below) shows a comparison in costs to characterize the Pantex site using either ESC or the traditional baseline method. The baseline assumed for this scenario includes the cost of the 11 wells done during Phase 1 characterization and an additional 43 wells that were proposed in the later phases of characterization.

For the ESC scenario, six Phase I wells were estimated and added to the actual ESC Phase II where only four soil borings, one of which was later turned into a well, and nine cone penetrometer pushes were completed. The ESC costs also include the additional 10 borings and the 5 monitoring wells that were installed after the ESC team left the site.

Table 2. Characterization Costs at the Pantex Plant

	ESC	Traditional
Preparation costs	$334,000	$150,000
Cone penetrometer pushes (CPT)	9	0
CPT total cost	$25,000	$0
Phase I penetrations	6	11
Other penetrations	19	43
Total penetrations	25	54
Average cost per penetration	$170,000	$192,000
ESC Phase I cost	$461,000	—
Overall penetration costs	$4.3 million	$10.4 million
Other costs	—	$1.4 million
Total Costs	$5.1 million	$11.9 million

Preparation costs for the two methods are different, because the ESC approach requires a significant analytical effort by the ESC team to prepare a conceptual model before visiting the site. This effort includes evaluation of existing data, identification of data inconsistencies, data reprocessing and preparation of a data archive referenced to the coordinate grid.

The next set of costs includes drilling and CPT costs incurred in the ESC investigation. The ESC team made 9 CPT pushes at a total cost of $25,000. Other penetrations by the ESC team include the 19 actual wells and soil borings and for the baseline method, the 43 proposed but never implemented wells. The cost per penetration for each approach are calculated from the actual costs incurred at the site, including labor for both the contractors and the science teams. The ESC costs per penetration are slightly lower because ESC made 13 soil borings but installed only 6 monitoring wells, while the traditional approach called for installation of 54 wells. The other cost data represents nonpenetration related costs incurred by the traditional approach including staff time.

Conclusions and Comments

- This hypothetical comparison predicts a 57% savings in cost and a 40% reduction in time using ESC as compared to the traditional baseline method proposed at the Pantex Plant.

The above scenario represents a conservative estimate of cost savings that can be attributed to the ESC methodology in a specific DOE remediation case. The largest component of the cost savings resulted from a reduction in the number of subsurface penetrations and the number of samples collected for analysis.

- ESC Projects summarized in Section 3 of this report generally demonstrated that the ESC investigation almost always results in a cost savings in the drilling and sampling category. Additional long-term savings in ground water monitoring and analysis costs may be realized due to the reduced number of monitoring wells installed.

- The LANL reports do not show that the application of ESC provides a significant cost advantage over baseline methods in the labor category. However, this may not be a correct assumption for all ESC investigations. An average ESC team member, as defined is quite senior and higher paid than a traditional site characterization scientist but due to nature of the ESC process is employed for a shorter time.

- LANL determined that a significant cost savings from the implementation of ESC may result from a reduction in time to complete the characterization, however, the cost savings from these factors is difficult to quantify in a rigorous manner.

  ◊ In DOE's Pantex Plant example, ESC delivers results in roughly half the time of its counterpart, two years ahead of the traditional method's schedule.

  ◊ Generally, the ability to start remediation work sooner will result in an earlier remediation remedy. However, it it very difficult to quantify cost savings. In present value terms, this shortened budget profile can even be a negative to the cost savings calculations as earlier expenditures cost the government more in present-value dollars.

  ◊ Regulatory policies, new technological approaches, and other factors will change over time with uncertain effects either increasing or decreasing future cleanup requirements and subsequent budgetary expenditures.

- A final advantage often projected for ESC is the improved characterization outcome. Better characterizations described in a number of the ESC projects have resulted in cleanups not needing to be done, and therefore, in major overall program cost reductions.

SECTION 6

REGULATORY/POLICY ISSUES

Regulatory Considerations

- Because ESC methodology explicitly includes regulatory interaction at the initiation of the project, concerns and issues important to the regulator will be addressed early in the process thus facilitating regulatory approval.
- Because regulatory agents are not legally bound by the recommendations of the ESC (or any other characterization) approach, time must be taken to be sure the regulators fully understand both the process and techniques to be employed.
- Normal drilling and sampling activities require that investigation derived wastes (IDW) (drilling fluids, cuttings, and equipment decontamination fluids) be handled according to RCRA. Emphasis on the use of non-intrusive methods and reduction of the number of subsurface penetrations should minimize amounts of IDW that are produced.

Safety, Risks, Benefits and Community Reaction

Worker Safety

- The risk to workers is minimized as the ESC approach incorporates use of non-invasive and minimally invasive techniques by using direct-push soil and ground water sampling equipment whenever practical. This results in a significant reduction in worker exposure as drill cuttings and drilling fluids are not used.
- The risk to workers is minimized because of reduced number of penetrations.
- The risk to workers is minimized due the reduction in the length of the remedial investigation.

Community Reaction

- Community involvement is explicit in the first stages of ESC. The community relations plan improves accountability to the public by helping the ESC project team identify the principal concerns of the stakeholders. The may help the ESC project team collect and present data that is responsive to stakeholders' needs.
- The emphasis on development and refinement of a clear conceptual model should improve community understanding and acceptance of the characterization process.
- The earlier initiation of remedial processes might lead to less community exposure to toxic compounds; this should be well received by the community.

SECTION 7

LESSONS LEARNED

- A potential challenge for implementation of ESC is contractor bidding. Because ESC is a flexible tool, it is a challenge to prepare requests for proposals and contracts that can be managed effectively. It may be appropriate to prepare contracts on a per-penetration basis for each technique. Alternatively, minimum sampling requirements could be agreed upon with the regulatory agency and the contractors could bid on the minimum requirements with a negotiated additional per-well or per-penetration cost.

- The ESC process avoids a presumption that remedial action is required. However, remediation engineering experience should be incorporated into the process as soon as the need for remedial action is recognized.

- The selection of team members with appropriate qualifications, experience, and capabilities is critical to successful implementation of ESC. The maintenance of the same team from project initiation to closure is also vital but is often difficult to achieve at DOE sites due to the demands on senior technical personnel.

- The ESC process at a typical site requires single mobilizations of 2 to 4 weeks for Phase I, and a mobilization of similar length for Phase II. Various site specific factors including stakeholder relationships, site area and access, site geology and hydrology, and contaminant characteristics will affect the actual time and cost of an investigation.

Re: Henry County
Campbell's Soup Company
OHD 005419171
Hazardous Waste

April 3, 2001

Mr. Michael Maringer
Manager, Service and Utilities
Campbell's Soup Company
East Maumee Avenue
Napoleon, Ohio 43545

Dear Mr. Maringer:

On October 1, 2000, this office received a report from Campbell's Soup Company (Campbell's) entitled RCRA Site Closure Investigation Work Plan: Former Holding Pit Area. The Ohio Environmental Protection Agency (Ohio EPA) has reviewed the document and offers the following comments:

1. Campbell's has not identified the full horizontal or vertical range of contamination. The sampling points provided to Ohio EPA in Figure 3 are acceptable, although more locations may be necessary if contamination is widespread. Campbell's is directed to sections 3.14 and 3.14.1 of Ohio EPA's Closure Plan Review Guidance for RCRA Facilities, Part I. Of particular importance is the need to sample vertically until 2 to 4 consecutive samples in the vertical direction and 2 samples in the horizontal direction show that concentrations of constituents are below their respective method detection limits (MDLs). Also, vertical sampling should extend at least 3 to 5 feet beyond the last point where a contaminant's concentration was above its detection limit.

2. The closure plan must state that the former sludge-holding pit was used from 1981 through 1983.

3. The closure plan must provide an estimate of the maximum volume of hazardous waste sludge present in the pit during its operation.

4. The closure plan must state that the waste codes associated with the wastes stored in the pit. Ohio EPA believes the appropriate codes to be D001, F003, and F005 based on sampling results, the materials' use as solvents, and MSDS sheets for the solvents provided to Ohio EPA by Campbell's.

5. The closure plan must specify methods for the removal of waste and contaminated media. Information pertaining to staging, loading, and transportation of this material must also be included, as well as the land disposal restrictions (LDR) status of each waste stream relative to treatment and disposal. Campbell's should consult section 3.6 of Ohio EPA's Closure Plan Review Guidance for RCRA Facilities, Part I for more detail.

6. Campbell's must include a description of how sampling equipment and reusable equipment (such as earth movers) will be decontaminated.

7. Campbell's must provide an estimate of how waste material generated from decontamination will be managed. Campbell's must also supply an estimate of the volume of waste material generated by decontamination efforts in the closure plan.

8. Campbell's may use a mobile laboratory for sample screening purposes only. The mobile laboratory should not be used for confirmation sampling or risk assessment purposes.

9. Campbell's closure plan must state that organic constituents must be below method detection limits in order to determine the full extent of contamination.

10. Campbell's closure plan must describe each step in removing waste and contaminated soil from the property. Campbell's should consult section 3.15 of Ohio EPA's Closure Plan Review Guidance for RCRA Facilities, Part I for more information on this subject.

11. Campbell's closure schedule must begin at the point of the director's approval and should be in the form of a milestone chart. The schedule should contain at least dates for soil removal, dates when a professional engineer will be present, dates for backfilling of soil, etc.

12. The closure plan must state that the Ohio EPA inspector will be notified at least 5 days in advance of all critical activities relating to the closure. These activities would include: initial day field activities begin, sampling of soils or ground water, and removal activities.

13. Campbell's closure certification must contain the exact wording found in Ohio Administrative Code rule 3745-50-42(D). The certification document must contain at least the information listed in section 3.18 of Ohio EPA's Closure Plan Review Guidance for RCRA Facilities, Part I.

This review should not be construed to constitute a complete review of Campbell's closure plan for the former holding pit area. The plan will be addressed in detail in future correspondence. This review did not include joint review by Ohio EPA's Division of Drinking and Ground Waters. If you have any questions, feel free to contact me at (419) 373-3070.

Sincerely,

Michael R. Terpinski

General

Purpose and Scope

The purpose of this work plan is to outline the tasks required to close a former holding pit area for the Campbell Soup Company Facility in Napoleon, Ohio. The Ohio EPA considers this former holding pit to be an unpermitted TSDF unit, and has issued an Order to properly close this unit in accordance with OAC Rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20.

Description of Facility

Site Description

The Campbell Soup Company Napoleon facility is located on the south side of East Maumee Avenue, Napoleon, Henry County, Ohio. The facility is located at the southeast edge of Napoleon, on the south side of the Maumee River (Figure 1). The former sludge-holding pit, located in the area identified in Figure 2, was the subject of this investigation.

The facility is involved with the processing, packaging, and distribution of food goods. The facility occupies _____ acres. _____ buildings are located on site, with the following characteristics:

Manufacturing	_____ Sq.Ft.
Waste Water Treatment Plant	_____ Sq. Ft.
Storage	
etc.	

The wastes associated with the former holding pit were generated during the preparation process for lining the insides of metal cans for soup and other food products. Solvents were used to prepare the inside of metal cans and containers for painting. Prior to using the former holding pit, spent solvent from the former can manufacturing operations was stored in 55-gallon drums and eventually used as a boiler fuel supplement (Boiler and Industrial Furnace 'BIF' Small Quantity Burner Exemption). Over time, solids accumulated in the drums, making handling of the spent solvents and drums difficult. To alleviate the solids problem, a temporary holding pit was constructed to receive and dry solids prior to off-site disposal. The pit was constructed atop an elevated area consisting of fill from other parts of the facility. Locally obtained clay was used to

construct containment dykes and to line the pit. The clay was compacted to reduce its permeability. The overall dimensions of the holding pit were approximately 20 feet wide by 35 feet long, and 2 ½ feet deep.

Semi-solid residues from the solvent drums were placed in the former holding pit and mixed with sand to reduce the moisture content of the material prior to off-site disposal. This practice was discontinued and the partially filled pits were decommissioned in 1983. A local contractor excavated the dykes and hauled the material to the Evergreen Landfill for disposal. The excavated area was filled with an additional 4- to 5-feet of new sand and natural soil fill material.

The earthen dikes were a one-time construction to remove semi-liquid solids from the drums. The practice was discontinued in 1983 with the excavation of the dikes. Because the solids and sludge materials temporarily placed in the holding pit were potentially exposed to volatile organic compounds (VOCs), a limited subsurface soil investigation was performed at the former holding pit area.

The results of the subsurface investigations were documented in the HSI GeoTrans, Inc. report entitled, "Limited Subsurface Soil Investigation", dated February 16, 2000 (previous investigation). The principle finding of the limited subsurface investigation is that VOCs do exist in the subsurface soils. This report was submitted to the Ohio EPA for review.

Map of Facility

A showing the location of the facility and its relationship to other local landmarks is presented as Figure 1. A detailed facility map, produced from an aerial photograph, is provided as Figure 2. Figure 2 identifies the location of the former holding pit within the facility.

Description of Hazardous Waste Management Units to be Closed

Site Surface Conditions

The former holding pit was constructed atop a mound created from fill soils transported from other grading or excavation activities at the facility. The pit was decommissioned and the dykes leveled prior to adding an additional 4 feet of new fill material over the former pit location. The elevated mound upon which the pit was located is currently 15 to 20 feet above natural grade.

Therefore, the former holding pit, while active, was approximately 11 to 16 feet above natural grade.

The current area where the former pit area was located is currently vacant and partially grass-covered. Several trees are located near the margins of the elevated fill area beyond the limits of the former holding pit.

Site Geology

Geoprobe$_{TM}$ borings completed in the former holding pit area during the previous investigation primarily identified the lithology as fill with varying amounts of clay till, silt and some sand. Other soil borings advanced by Campbell Soup Company in other parts of the facility reportedly encountered stiff clay at 4 feet below the natural grade. This clay is reportedly at least 10 feet in thickness. The high clay content of the local sediments is consistent with the former flood plain and glacial lacustrine deposits that characterize this part of Henry County. The bedrock located beneath the clay-rich surfical deposits is comprised of Devonian Aged shale and carbonates. The local depth to bedrock has not yet been determined.

Site Hydrogeology

The depth to groundwater at the site was not determined during the previous limited soil investigation. However, publications available through the Ohio State University Extension program indicate that groundwater in Henry County is obtained primarily from a carbonate aquifer located beneath 40 to 85 feet of glacial drift. The City of Napoleon uses surface water obtained from the Maumee River as its public water supply source.

Nature and Extent of Impacts in Soil

Soil screening using a photoionization detector (PID) identified organic vapors in soil under the former holding pit, and follow-up sampling verified the presence of several specific volatile Organic Compounds (VOCs)[1]. The following compounds were identified above the laboratory method PQLs during the previous investigation: acetone, ethyl benzene, MEK, MIBK, naphthalene, and xylene. Toluene and 1,4-dichlorobenzene were also detected at concentrations below the laboratory method PQLs. The highest concentrations of VOCs were reported from 6 to 9 feet below surface grade (bsg). The photoionization detector (PID) identified organic vapors between about 2 and 9 feet bsg. The approximate horizontal extent of the contaminated area is

[1] Limited Subsurface Soil Investigation, Former Holding Pit Area, February 16, 2000, HSI GeoTrans

approximately 60 by 60 feet. The vertical distribution and the horizontal extent of the contaminated area to the northwest was not fully determined during the previous investigation.

Site Conceptual Model

The native soil under the area of investigation consists primarily of stiff clay and sandy clay deposits. The area under the former holding pit consists of fill materials imported from other locations in the facility, and is elevated above natural grade. The former holding pit was excavated into this non-native fill, and used for approximately 2 years to temporarily hold semi-solid wastes prior to off-site disposal. Sand was mixed with the sludge to decrease the moisture content prior to disposal. When the pit was abandoned, the contents and clay dykes and liner were removed, and the pit side-walls pushed into the pit bottom. The area was re-graded and approximately four feet of fill placed over the former pit area. Some of the mixing sand may have been regraded into the fill, possibly producing thin and isolated soil layers with higher relative permeability. Additional fill has been placed over the former holding pit area since the pit was demolished.

Based on conversations with plant personnel and the soil profile observed during the previous limited soil investigation, the area formerly occupied by the holding pit has the following general lithologic profile:

- From 0 to 4 feet below grade – more recent fill material consisting of clay, cinder, and construction debris.
- From 4 feet to 6 feet below grade – mixed materials consisting of the former collapsed pit berms and sand used for mixing.

- From 6 feet to about 15 feet below grade - older (pre-holding pit) fill material consisting of clay with some sand or silt and some cinders.
- From about 15 feet to more than 20 feet below grade - native clay and fine textured sediments

A schematic cross sectional representation of the former holding pit is provided as Appendix B. Based on this generalized lithologic description and cross sectional profile, it is expected that chemical concentrations associated with the materials stored in the former holding pit will occur at the highest concentrations in the horizon associated with the bottom of the former clay pit, or at 6 to 8 feet below the current ground surface. This horizon contains the most sand and may be most permeable. Concentrations should decrease with depth, depending on the effectiveness of

the clay liner and clay content of the underlying fill. The underlying clay-rich native soil should act as a barrier to continued vertical migration. Some leakage through the clay liner could have occurred during the two years of pit activity if the clay liner possessed inhomogeneities, fissures or other structural weaknesses, or if the clay's permeability was affected by chemical interactions.

Local Occurrence of Groundwater

Groundwater was not encountered in any boring completed in the preliminary soil investigation. Borings were advanced to a depth of 12 feet below grade with no observed soil saturation. Any moisture observed in soils is due to transient water, as the borings were generally too shallow to extend below the natural grade.

Information related to groundwater under the facility is not readily available. The Henry County Health Department was contacted to obtain general information relating to local groundwater availability. Few water users obtain water from groundwater resources in the area. Most water supply systems obtain surface water from the Maumee River. Private wells may be present beyond the limits of the Napoleon water supply distribution system. Additional file review and record acquisition efforts are required to further evaluate the water bearing formations, the depth to groundwater, the direction of groundwater movement, and the potential for groundwater to be affected by the soil conditions under the former pit area.

The potential for groundwater impact will depend on the penetration depth of infiltrating chemicals. If the vertical extent of contamination is limited to soil above natural grade, then groundwater cannot be affected and groundwater occurrence is irrelevant. If soil contaminants extend into the natural soils below natural grade, then additional shallow hydrogeological information will be required.

Vertical and Horizontal Extent of VOCs in the Area of Impact

During the limited subsurface soil investigation, soil samples were screened for organic vapors using a PID, and select soil samples were collected and analyzed in a laboratory for VOCs. VOC samples were obtained from a uniform depth of approximately 10 feet in all borings, and from approximately 6 feet in several borings with high relative concentrations. This work was appropriate for identifying whether an environmental issue existed, what concentrations were present, and for estimating the approximate volume of affected soil. However, it did not satisfy the criteria for delineating soil and groundwater conditions as part of a RCRA closure investigation.

To adequately characterize the soil contamination, additional soil samples need to be collected. PID data is useful for screening soil samples, but is not an acceptable method for conducting a RCRA closure investigation. The sample boring grid spacing was satisfactory, but the vertical distribution of VOCs in each boring was not sufficiently evaluated. In addition, horizontal delineation was not completed to the north and west of the main grid. Therefore, additional soil samples must be collected from various depth intervals in and around the former holding pit to characterize the soil contamination and determine the vertical and horizontal extent of VOCs under and around the former holding pit.

Occurrence of SVOCs in the Area of Impact

The Ohio EPA requested that the soil under the former holding pit be evaluated for semi-volatile organic compounds (SVOCs). SVOCs are not expected to be a major constituent of the wastes stored temporarily in the former holding pit – however, the occurrence of naphthalene suggests that SVOC evaluation may be warranted. Additional soil samples need to be collected throughout the sampling area to determine whether SVOCs are present, and whether they will be a factor in determining future remediation strategies or action plans.

Detailed Drawing of Unit(s) to be Closed

Figure ____ presents the estimated location of the former holding pit. This location is based on the recollection of facility personnel and on analytical data obtained from the Limited Subsurface Soil Investigation.

List of Hazardous Wastes

Chemicals of Concern

The materials stored in the former holding pit generally were associated with wastes recovered from the enamel coating process for the inside of food containers. According to the Material Safety Data Sheets (MSDS) provided for these enamels (copies submitted to OEPA on April 20, 2000), the chemical constituents that may have been present in the waste materials stored in the holding pit include the following:

Alcohols	- n-butanol
Ethers	- diethyl glycol monobutyl ether - ethylene glycol monobutyl ether

- glycol ether
- propylene glycol methyl ether

Ketones
- cyclohexanone
- 2-butanone (MEK)
- methyl isobutyl ketone (MIBK)

Formaldehyde

Xylenes

Chemicals that were actually detected in soils under the former holding pit during the limited soil investigation include the following:

Acetone

2-Butenone (MEK)

1,4-Dichlorobenzene (at concentrations below the practical quantification limit (PQL))

Ethyl benzene

4-methyl-2-pentanone (MIBK)

Naphthalene

Toluene (at concentrations below the PQL)

Xylenes

Although there is no indication that semi-volatile organic compounds (SVOCs) were constituents of the materials stored in the former holding pit, the Ohio EPA has requested that their presence be evaluated at this site. The occurrence of naphthalene in soil samples indicates that simple polynuclear aromatic compounds are present.

Removal of Hazardous Wastes

Equipment and protocol
Staging, loading and transportation
Storage, treatment, and disposal
Land Disposal Restrictions (LDRs) of each waste stream

Type of disposal facility – waste manifests

Schedule for Closure

The following schedule is proposed for this scope of work:

Activity	Days from Receipt of OEPA Approval
Complete Site Health & Safety Plan	15
Complete field sampling	45
Evaluate data	60
Submit Investigation Report	75

Add waster removal, sampling, soil removal, engineer inspection/certification, backfill, etc.

Other Permits

Air Emissions and Wastewater

Any groundwater > on site WWTP. Air not an issue.

Personnel Health and Safety

Prior to initiating field activities, a Site Health & Safety Plan will be prepared in accordance with OSHA, 29 CFR 1910.120. The Site Health & Safety plan will be provided to any subcontractor involved in the on-site implementation of this work plan. An on-site meeting will be held with contractors prior to initiating field activities to ensure they understand the potential hazards associated with the implementation of this work plan.

The Health & Safety plan document will include the following information:

- Key personnel and responsibilities
- Training and medical Surveillance Requirements
- Site Description
- Work Objectives
- Hazard evaluation
- Air monitoring
- Personal protective equipment
- Decontamination and site control procedures
- Residuals management
- Emergency information and contacts
- Contingency plan for emergencies
- Spill containment procedures, and
- Confined space entry procedures

Decontamination Efforts

Steam clean big stuff, liquinox and rinse snall tools, collect water and go to WWTP?

Closure Strategy/Remediation Standards for Soil (Including Ground Water)

Determine the Local Occurrence of Groundwater

The local occurrence of groundwater will be determined by obtaining and reviewing readily available hydrogeological references and reports, geological references and reports, and other documents available through the Ohio EPA, Henry County, academic institutions, and other sources.

Local area well records will be obtained from the Ohio EPA and the Henry County Health Department to evaluate the location of water supply wells, the formations supplying water to wells, the depth to groundwater, and if possible, the general direction of groundwater flow.

If the soil probes indicate that soil contamination is limited to the fill material, and does not extend below the natural grade level, then no additional groundwater investigation will be required. If the soil borings extend below natural grade, then soil borings will be observed for 15

to 30 minutes to determine whether water enters the boring. In this event, a sample of the groundwater will be collected and additional groundwater investigation activities will be necessary.

Determine the Vertical and Horizontal Extent of VOCs in Soil Under and Surrounding the Former Holding Pit

Approximately twenty-two Geoprobe$_{TM}$ soil borings will be advanced in and around the area previously investigated during the limited subsurface soil investigation (Figure3). Samples will be collected from these borings from depths of approximately 3, 6, and 12 feet below grade to evaluate the vertical distribution of VOCs in and around the known affected area. An additional deeper sample will be collected from each boring at depths of approximately 14 feet and held at the laboratory for later evaluation, pending the results of the 12-foot sample analysis. Samples will not be collected from depths shallower than 3 feet because this soil consists of fill material which post dates the demolition and re-grading of the former holding pit.

Determine Whether SVOCs are Present in Soil Under the Former Holding Pit

To address the Ohio EPA request for evaluating SVOCs in soil, samples will be collected from the 3, 6 and 12 foot intervals at each boring indicated in Figure 3. A sample will also be collected

from the 14 foot depth interval and held for possible later evaluation. These samples will be analyzed for semi-volatile aromatic compounds; specifically the polynuclear aromatic compounds (PNAs).

Naturally Occuring Elements

Alternative A: Comparison to Background Conditions

Alternative B: Comparison to Generic Remediation Standards

Closures Involving Characteristic Wastes Only

Compounds Not Naturally Occuring

Determination of the Number of Samples

(BACKGROUND AND CLOSURE VERIFICATION)

Risk-Based Remediation Standards

Sampling Plan and Analytical Procedures

(ADD INFO RE: CLOSURE SAMPLES AND BACKGROUND SAMPLES)

METHODS AND PROCEDURES

The sample collection and handling procedures described below will be used to implement the scope of work presented in this work plan. A mobile laboratory will be used to obtain immediate-to-short turn around analytical results and SVOC will be analyzed in addition VOCs. The EPA Method 5035 (field methanol preservation) procedure will not be used during this investigation phase of this work plan because it will negatively affect the detection limits of the on-site mobile laboratory apparatus.

With the exception of the use of a mobile laboratory and the evaluation of SVOCs, the methods and procedures described below are the same as those implemented during the previous investigation activities described in the Limited Subsurface Soil Investigation, dated February 16, 2000.

Soil Borings

Soil borings will be advanced to a total depth of 14 feet using Geoprobe$_{TM}$ direct push methods. The sample will be collected in four-foot long 2-inch diameter macro-sampler core barrels lined with clear PVC sampling sleeves. A clean stainless steel knife will be use to dissect the liner to extract the sample

for evaluation. Part of the sample will be field screened using a PID. Soil samples representative of the depth intervals identified in Section 4 of this document will be collected using a clean wood or stainless steel spatula and submittal to an on-site mobile laboratory technician for VOC and/or SVOC (PNA) analyses.

Sample Handling and Analyses

Probe rods will be decontaminated between borings using Liquinox detergent and rinsed with clean deionized water. All tools used to extract the soil samples from the sampling tubes will be cleaned using a Liquinox detergent solution and rinsed with de-ionized water prior to collecting each sample. Decontamination fluids and rinses will be disposed at the facility waste water treatment plant. New latex gloves will be worn by the sampling personnel and changed between sample collection events.

Samples will be placed in pre-labeled containers provided by the mobile laboratory technician. Each container will be specifically marked for the parameter to be analyzed. Sample preservatives (if necessary) will be pre-measured and placed into the sample containers by the mobile laboratory tachnician. Each sample container will have a label to record the sample identification, sample depth, sample date and time, parameter(s) for analysis, person collecting the sample, and other pertinent data. Once filled, sample containers will be placed in a chilled insulated cooler until it is extracted and loaded into the mobile laboratory GC/MS. Sample information and handling history will be documented on laboratory supplied chain-of-custody forms.

Samples will be analyzed in mobile laboratory units provided and operated by New Age/Landmark Mobile Laboratory Services, of Benton Harbor, Michigan. QA/QC Plan document can be submitted to the Ohio EPA upon request.

Volatile organic compounds will be analyzed by GC/MS using EPA Method 8260. Semi-volatile organic compounds will be analyzed using EPA Method 8270.

Withdrawal of Earlier Work Plan Submission

Gentlemen:

This is to request withdrawal of our previous submittal of "RCRA Closure Investigation Work Plan – Former Holding Pit Area" dated November 2, 2000. Also, we request your approval of extension of the time required for submittal of RCRA Closure Plan for 90 days from the date of this letter. Pursuant to our discussion with Mr. Mike Terpinski, this extension will allow the completion of sampling activities and to obtain the necessary information for the preparation of an appropriate Closure Plan in accordance with OAC rules.

Please give me a call at 856-968-4423 if you have any questions.

Sincerely,

CAMPBELL SOUP COMPANY

ENTERED DIRECTOR'S JOURNAL

BEFORE THE
OHIO ENVIRONMENTAL PROTECTION AGENCY

In the Matter of:

Campbell Soup Company
World Headquarters
1 Campbell Place
Camden, NJ 08103-1799

and

Campbell Soup Supply Company L.L.C.
12 773 State Route 110
Napoleon, OH 43545

Respondents

Director's Final Findings and Orders

PREAMBLE

It is hereby agreed by and among the parties hereto as follows:

I. JURISDICTION

These Director's Final Findings and Orders ("Orders") are issued to the Campbell Soup Company and Campbell Soup Supply Company L.L.C. ("Respondents") pursuant to the authority vested in the Director of the Ohio Environmental Protection Agency ("Ohio EPA") under § 3734.13 and § 3745.01 of the Ohio Revised Code ("ORC").

II. PARTIES BOUND

These Orders shall apply to and be binding upon the Respondents, their assigns and successors in interest. No changes in ownership relating to the Facility will in any way alter the Respondents' responsibilities under these Orders. The Respondents' obligations under these Orders may be altered only by the written approval of the Director of Ohio EPA.

III. DEFINITIONS

1. Unless otherwise stated, all terms in these Orders shall have the same meaning as used in Chapter 3734. of the ORC and the regulations promulgated thereunder.

I certify this to be a true and accurate copy of the official document as filed in the records of the Ohio Environmental Protection Agency.

Date: 10-18-2000

2. The effective date of these Orders is the date these Orders are entered into the Ohio EPA Director's journal.

IV. FINDINGS OF FACT

Respondents are entering into these Orders to resolve a disputed claim. Nothing in these Orders shall be construed as an admission of fact or of liability by Respondents. The Director of Ohio EPA has determined the following findings of fact:

1. Respondents are "persons" as defined in ORC § 3734.01(G) and Ohio Administrative Code ("OAC") rule 3745-50-10(A).

2. Respondents own and operate a food production plant located at 12 773 State Route 110, in Napoleon, Henry County, Ohio ("Facility"). Respondent, Campbell Soup Company, is a New Jersey corporation. Respondent, Campbell Soup Supply Company L.L.C., a subsidiary of Campbell Soup Company, is a Delaware limited liability company registered to do business in the State of Ohio on July 26, 1999. At the Facility, Respondents produce heat processed food products including soups and several types of vegetable juices. Respondents manufactured cans at the Facility until July, 1998.

3. At the Facility, Respondents generate "hazardous waste" as that term is defined by ORC § 3734.01(J) and OAC rules 3745-50-10(A) and 3745-51-03.

4. Respondent, Campbell Soup Company, notified the United States Environmental Protection Agency ("U.S. EPA") of its hazardous waste activity at the Facility and was issued U.S. EPA identification number OHD 005 419 171 on August 2, 1980.

5. On November 18, 1980, Respondent, Campbell Soup Company, submitted a Part A permit application for the Facility to the U.S. EPA. The Part A application identified storage of hazardous waste at the Facility in tanks and containers and thermal treatment of hazardous waste in a boiler located at the Facility.

6. As noted in Finding No. 2. above, Respondents manufactured cans at the Facility until July, 1998. In the manufacture of the cans, Respondents utilized coating machines to apply a rust inhibitor to the cans to increase durability. Maintenance activities on the coating machines generated listed and characteristic hazardous waste coating material.

7. The hazardous waste coating material referenced in Finding No. 6. above, consisted of a liquid phase (top or "solvent" layer) and a semi-solid phase. Only

the liquid phase (top or "solvent" layer) of the hazardous waste coating material was amenable for use as a fuel. Ohio EPA asserts that Respondents poured the liquid phase (top or "solvent" layer) onto a coal pile and then burned as a fuel the coal in a boiler located at the Facility.

8. According to information provided by Respondents, between 1981 and 1983, Respondents stored and/or disposed of the semi-solid phase of the hazardous waste coating material which was not amenable for burning in at least two earthen pits ("Pits") located at the Facility. According to information provided by Respondents, the Pits were approximately 20 feet by 40 feet and were 2.5 to 3 feet deep. According to information provided by Respondents, Respondents excavated the Pits sometime in 1983. Respondents mixed the excavated hazardous waste with sand and sent the waste off-site for disposal at Evergreen Landfill in Northwood, Ohio.

9. On December 2 and 3, 1999, Respondents conducted limited sampling of the former Pits area. Sampling results, provided to Ohio EPA on March 23, 2000, revealed volatile organic chemical contamination at depths at least as great as ten feet below ground surface.

10. By letter dated May 16, 2000, Ohio EPA notified Respondents that Ohio EPA believed Respondents had stored, treated, and disposed of hazardous waste at the Facility without a hazardous waste facility installation and operation permit, in violation of ORC § 3734.02(E). In the May 16, 2000 letter, Ohio EPA also directed Respondents to submit to Ohio EPA a closure plan. In addition to the violation of ORC § 3734.02(E), Ohio EPA has determined that Respondents failed to evaluate the waste coating material, in violation of OAC rule 3734-52-11.

11. It is Ohio EPA's position that the Pits, where hazardous waste was disposed of without a permit, are hazardous waste management units subject to applicable hazardous waste facility requirements, including OAC rules 3745-55-11/3745-66-11. The Pits have not undergone closure, as required by and pursuant to OAC rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20.

V. ORDERS

The Respondents shall achieve compliance with Chapter 3734. of the ORC and the regulations promulgated thereunder according to the following compliance schedule:

1. Respondents shall close the Pits area at the Facility where hazardous waste was

disposed of without a permit, in accordance with OAC rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20. Within 30 days after the effective date of these Orders, Respondents shall submit to Ohio EPA a closure plan, prepared in accordance with OAC rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20.

2. The closure plan referenced in Order No. 1 is subject to Ohio EPA review and approval. If Ohio EPA does not approve the closure plan, and provides Respondents with a written statement of deficiencies, Respondents shall, within 30 days after receipt of such written statement, revise the closure plan or submit a new closure plan to Ohio EPA addressing the deficiencies. Ohio EPA may approve the closure plan with modifications, after providing Respondents with a reasonable opportunity to comment thereon. If Ohio EPA modifies the closure plan, the modified closure plan shall become the approved closure plan.

3. Upon receiving Ohio EPA's written approval of the closure plan, Respondents shall implement the approved closure plan pursuant to the specifications and schedules contained in the approved closure plan, any modifications attached to the approved closure plan, and OAC rules 3745-55-13/3745-66-13.

4. Within 60 days after completion of closure, Respondents shall submit to Ohio EPA a closure certification in accordance with OAC rules 3745-55-15/3745-66-15.

5. Within 60 days after the effective date of these Orders, Respondents shall submit to Ohio EPA a closure cost estimate and documentation demonstrating that Respondents have established financial assurance and liability coverage for closure in accordance with OAC rules 3745-55-42/3745-66-42 through 3745-55-47/3745-66-47.

6. Within 30 days from the effective date of these Orders, Respondents shall pay to Ohio EPA the amount of $80,000.00 in settlement of Ohio EPA's claims for civil penalties which may be assessed for noncompliance pursuant to ORC Chapter 3734. and which will be deposited into the hazardous waste cleanup fund established pursuant to ORC § 3734.28. Payment shall be made by tendering a certified check for $80,000.00 to Ohio EPA, Department 631, Columbus, Ohio 43265-0631, made payable to "Treasurer, State of Ohio." A copy of this check shall be submitted in accordance with Section IX of these Orders.

VI. TERMINATION

The Respondents' obligations under these Orders shall terminate when the

Respondents demonstrate in writing and certify to the satisfaction of Ohio EPA that all obligations under these Orders have been performed and Ohio EPA's Division of Hazardous Waste Management acknowledges, in writing, Ohio EPA's acceptance of this demonstration and certification.

This certification shall be submitted by the Respondents and shall be signed by a responsible official of the Respondents. The certification shall make the following attestation: "I certify that the information contained in or accompanying this certification is true, accurate and complete."

For purposes of these Orders, a responsible official is a corporate officer who is in charge of a principal business function of the Respondents.

VII. OTHER CLAIMS

Nothing in these Orders shall constitute or be construed as a release from any claim, cause of action or demand in law or equity against any person, firm, partnership or corporation, not a signatory to these Orders, for any liability arising out of or relating to the operations of the Respondents' Facility.

VIII. OTHER APPLICABLE LAWS

All actions required to be taken pursuant to these Orders shall be undertaken in accordance with the requirements of all applicable local, state and federal laws and regulations. Nothing in these Orders shall be construed as waiving or compromising in any way the applicability and enforcement of any other statutes or regulations applicable to the Respondents' operation of the Facility. Ohio EPA reserves all rights and privileges except as specified herein. Respondents reserve all rights and defenses which may be available at law or in equity and under any statute, regulation or common law applicable to Respondents' operation of the Facility, except as specified herein.

IX. NOTICE

All documents demonstrating compliance with these Orders, and other documents required under these Orders to be submitted to Ohio EPA, shall be addressed to:

Ohio Environmental Protection Agency
Northwest District Office
Division of Hazardous Waste Management
Attn: DHWM Manager
347 North Dunbridge Road

Bowling Green, OH 43402

and Ohio EPA Central Office at the following address:

For mailings, use the post office box number:

Christopher Jones, Director
Ohio Environmental Protection Agency
Lazarus Government Center
Division of Hazardous Waste Management
Attn: Manager, Compliance Assurance Section
P.O. Box 1049
Columbus, Ohio 43216-1049

For deliveries to the building and courier services:

Christopher Jones, Director
Ohio Environmental Protection Agency
Lazarus Government Center
Division of Hazardous Waste Management
Attn: Manager, Compliance Assurance Section
122 South Front Street

or to such persons and addresses as may hereafter be otherwise specified in writing by Ohio EPA.

All documents to be submitted to Respondents under this Order shall be addressed to:

Dr. Osman Aly
Director - Environmental Affairs
Campbell Soup Company
Campbell Place
Camden, New Jersey 08103

and

Corporate Secretary
Campbell Soup Company
Campbell Place
Camden, New Jersey 08103

X. RESERVATION OF RIGHTS

Nothing contained herein shall be construed to prevent Ohio EPA from seeking legal or equitable relief to enforce the terms of these Orders or from taking administrative, legal or equitable action as deemed appropriate and necessary, including seeking penalties against the Respondents for noncompliance with these Orders. Nothing contained herein shall be construed to prevent Ohio EPA from exercising its lawful authority to require the Respondents to perform additional activities, including closure of additional hazardous waste management units at the Facility, pursuant to ORC Chapter 3734. or any other applicable law in the future. Nothing herein shall restrict the right of the Respondents to raise any administrative, legal or equitable claim or defense with respect to such further actions which Ohio EPA may seek to require of the Respondents. Nothing in these Orders shall be construed to limit the authority of Ohio EPA to seek relief for violations not addressed in these Orders.

XI. SIGNATORIES

Each undersigned representative of a signatory to these Orders certifies that he or she is fully authorized to enter into these Orders and to legally bind such signatory to this document.

IT IS SO ORDERED:

Christopher Jones
Director

October 18, 2000
Date

XII. WAIVER

In order to resolve disputed claims, without admission of fact, violation or liability, and, subject to Section X of these Orders, in lieu of further enforcement action by Ohio EPA for only the violations addressed in these Orders, the Respondents agree that these Orders are lawful and reasonable, that the times provided for compliance herein are reasonable and that the Respondents agree to comply with these Orders. Subject to Section X., above, compliance with these Orders shall be a full accord and satisfaction for the Respondents' liability for the violations cited herein.

The Respondents hereby waive the right to appeal the issuance, terms and service of these Orders and hereby waive any and all rights they might have to seek administrative or judicial review of these Orders either in law or equity.

Notwithstanding the preceding, Ohio EPA and the Respondents agree that in the event that these Orders are appealed by any other party to the Environmental Review Appeals Commission, or any court, the Respondents retain the right to intervene and participate in such appeal. In such an event, the Respondents shall continue to comply with these Orders notwithstanding such appeal and intervention unless these Orders are stayed, vacated or modified.

IT IS SO AGREED:

1 Campbell Place
Camden, NJ 08103-1799

RE: Proposed Director's Final Findings and Orders - Campbell Soup Company and Campbell Soup Supply Company L.L.C.

Dear Mr. Johnson:

The hazardous waste violations that have occurred at the Campbell Soup facility located in Napoleon, Ohio concern me. During a meeting conducted on March 23, 2000, Campbell Soup provided information to Ohio EPA which revealed that Campbell Soup disposed of hazardous waste at the Napoleon facility without a hazardous waste facility installation and operation permit in violation of Ohio law. Specifically, the information provided by Campbell Soup revealed that Campbell Soup stored and disposed of listed and characteristic hazardous waste in at least two earthen pits located at the Napoleon facility. Furthermore, the information provided by Campbell Soup revealed that the unpermitted storage and disposal of hazardous waste in the pits occurred over a two year period from 1981 to 1983. By letter dated May 16, 2000, Ohio EPA notified Campbell Soup that based upon the storage and disposal of hazardous waste in the pits without a permit, Campbell Soup had violated Ohio Revised Code § 3734.02(E). Additionally, Ohio EPA has determined that Campbell Soup also failed to properly evaluate its wastes to determine if the waste was hazardous waste, in violation of Ohio Administrative Code rule 3745-52-11. Due to the seriousness of the violations, I have determined that an enforcement action is necessary.

I recognize that Campbell Soup brought the unpermitted storage and disposal of hazardous waste in the pits to Ohio EPA's attention. I am encouraged by Campbell Soup's self-reporting of the violation and have taken this fact into consideration when determining the appropriate civil penalty settlement. Please note that based upon the Campbell Soup's self-reporting of the violation, the proposed civil penalty settlement has been mitigated by 25 percent.

Although Campbell Soup brought the violations to Ohio EPA's attention, the violations are serious and Director's Final Findings and Orders are warranted. Based upon Campbell Soup's disclosure of these violations and the willingness expressed by Campbell Soup to close the unpermitted hazardous waste storage and disposal area, I believe this matter can be resolved amicably and expeditiously through negotiated Director's Final Findings and Orders. A resolution through negotiated Director's Final Findings and Orders would avoid the time and expense associated with litigation upon referral to the Ohio Attorney General. I request that Campbell Soup promptly attend to this matter.

Attached, please find proposed Director's Final Findings and Orders and a summary of the civil penalty settlement assessment. As proposed, the Director's Final Findings and Orders require Campbell Soup to pay to Ohio EPA a $94,762.50.00 civil penalty settlement and close the pits area where the hazardous waste was stored and disposed of without a permit. Please also find attached an information sheet. The information sheet is designed to assist Campbell Soup in understanding the administrative enforcement process within Ohio EPA's Division of Hazardous Waste Management. The information sheet includes answers to questions which are commonly asked by parties involved in the administrative enforcement process.

If Campbell Soup is willing to accept the proposed Director's Final Findings and Orders as written, please notify Todd Anderson of Ohio EPA's Legal Office at (614) 644-3037 within fourteen (14) days of Campbell Soup's receipt of this letter. If Campbell Soup is unwilling to sign the Director's Final Findings and Orders as written, Ohio EPA encourages Campbell Soup to pursue the possibility of settlement through a settlement meeting or telephone conference. Prior to any settlement meeting or telephone conference, Ohio EPA requests that Campbell Soup provide a written response to the proposed Director's Final Findings and Orders that clearly and directly explains Campbell Soup's position regarding the orders. Campbell Soup should pay particular attention to **Section IV., Findings of Fact** and **Section V., Orders** when developing its response. It would also be helpful if the response stated the circumstances or arguments that Campbell Soup alleges constitute grounds for defense, if any, and the facts Campbell Soup believes Ohio EPA should consider in determining whether to mitigate the proposed civil penalty settlement. Please note, as mentioned previously, the $94,762.50.00 proposed civil penalty settlement already includes a 25 percent mitigation addressing Campbell Soup's self-reporting. Also, Ohio EPA may be willing to mitigate a portion of the proposed civil penalty settlement if Campbell Soup agrees to implement a mutually agreed-upon supplemental environmental project.

If Campbell Soup desires to hold a settlement meeting or telephone conference, please contact Mr. Anderson at the telephone number above within fourteen (14) days of receipt of this letter. If Campbell Soup should decline to enter into negotiated Director's Final

Findings and Orders or if Campbell Soup does not respond to this letter within fourteen (14) days, I will deem this offer withdrawn and I will consider other enforcement alternatives including referral of this matter to the Ohio Attorney General's Office.

Because this letter and the attached documents summarize a proposed settlement, I consider them inadmissible by Campbell Soup for any purpose in any enforcement action that the state may take should Campbell Soup decline this offer.

Sincerely,

Christopher Jones
Director

BEFORE THE
OHIO ENVIRONMENTAL PROTECTION AGENCY

In the Matter of:

Campbell Soup Company
World Headquarters
1 Campbell Place
Camden, NJ 08103-1799

and

Campbell Soup Supply Company L.L.C.
12 773 State Route 110
Napoleon, OH 43545

Respondents

Director's Final Findings and Orders

PREAMBLE

It is hereby agreed by and among the parties hereto as follows:

I. JURISDICTION

These Director's Final Findings and Orders ("Orders") are issued to the Campbell Soup Company and Campbell Soup Supply Company L.L.C. ("Respondents") pursuant to the authority vested in the Director of the Ohio Environmental Protection Agency ("Ohio EPA") under § 3734.13 and § 3745.01 of the Ohio Revised Code ("ORC").

II. PARTIES BOUND

These Orders shall apply to and be binding upon the Respondents, their assigns and successors in interest. No changes in ownership relating to the Facility will in any way alter the Respondents' responsibilities under these Orders. The Respondents' obligations under these Orders may be altered only by the written approval of the Director of Ohio EPA.

III. DEFINITIONS

1. Unless otherwise stated, all terms in these Orders shall have the same meaning as used in Chapter 3734. of the ORC and the regulations promulgated thereunder.

2. The effective date of these Orders is the date these Orders are entered into the Ohio EPA Director's journal.

IV. FINDINGS OF FACT

The Director of Ohio EPA has determined the following findings of fact:

1. Respondents are "persons" as defined in ORC § 3734.01(G) and Ohio Administrative Code ("OAC") rule 3745-50-10(A).

2. Respondents own and operate a food production plant located at 12 773 State Route 110, in Napoleon, Henry County, Ohio ("Facility"). Respondent, Campbell Soup Company, is a New Jersey corporation. Respondent, Campbell Soup Supply Company L.L.C., a subsidiary of Campbell Soup Company, is a Delaware limited liability company registered to do business in the State of Ohio on July 26, 1999. At the Facility, Respondents produce heat processed food products including soups and several types of vegetable juices. Respondents manufactured cans at the Facility until July, 1998.

3. At the Facility, Respondents generate "hazardous waste" as that term is defined by ORC § 3734.01(J) and OAC rules 3745-50-10(A) and 3745-51-03.

4. Respondent, Campbell Soup Company, notified the United States Environmental Protection Agency ("U.S. EPA") of its hazardous waste activity at the Facility and was issued U.S. EPA identification number OHD 005 419 171 on August 2, 1980.

5. On November 18, 1980, Respondent, Campbell Soup Company, submitted a Part A permit application for the Facility to the U.S. EPA. The Part A application identified storage of hazardous waste at the Facility in tanks and containers and thermal treatment of hazardous waste in a boiler located at the Facility.

6. As noted in Finding No. 2. above, Respondents manufactured cans at the Facility until July, 1998. In the manufacture of the cans, Respondents utilized coating machines to apply a rust inhibitor to the cans to increase durability.

Maintenance activities on the coating machines generated listed and characteristic hazardous waste coating material.

7. The hazardous waste coating material referenced in Finding No. 6. above, consisted of a liquid phase (top or "solvent" layer) and a semi-solid phase. Only the liquid phase (top or "solvent" layer) of the hazardous waste coating material was amenable for use as a fuel. Respondents poured the liquid phase (top or "solvent" layer) onto a coal pile and then burned as a fuel the coal in a boiler located at the Facility. Respondents also transported or caused to be transported some of the hazardous waste coating material consisting of both the liquid phase (top or "solvent" layer) and the semi-solid phase off-site.

8. According to information provided by Respondents, between 1981 and 1983, Respondents stored and/or disposed of the semi-solid phase of the hazardous waste coating material which was not amenable for burning in at least two earthen pits ("Pits") located at the Facility. According to information provided by Respondents, the Pits were approximately 20 feet by 40 feet and were 2.5 to 3 feet deep. According to information provided by Respondents, Respondents excavated the Pits sometime in 1983. Respondents mixed the excavated hazardous waste with sand and sent the waste off-site for disposal at Evergreen Landfill in Northwood, Ohio.

9. On December 2 and 3, 1999, Respondents conducted limited sampling of the former Pits area. Sampling results, provided to Ohio EPA on March 23, 2000, revealed volatile organic chemical contamination at depths at least as great as ten feet below ground surface.

10. By letter dated May 16, 2000, Ohio EPA notified Respondents that Respondents had stored, treated, and disposed of hazardous waste at the Facility without a hazardous waste facility installation and operation permit, in violation of ORC § 3734.02(E). In the May 16, 2000 letter, Ohio EPA also directed Respondents to submit to Ohio EPA a closure plan. In addition to the violation of ORC § 3734.02(E), Ohio EPA has determined that Respondents failed to evaluate the waste coating material, in violation of OAC rule 3734-52-11.

11. The Pits, where hazardous waste was disposed of without a permit, are hazardous waste management units subject to applicable hazardous waste facility requirements, including OAC rules 3745-55-11/3745-66-11. The Pits have not undergone closure, as required by and pursuant to OAC rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20.

V. ORDERS

The Respondents shall achieve compliance with Chapter 3734. of the ORC and the regulations promulgated thereunder according to the following compliance schedule:

1. Respondents shall close the Pits area at the Facility where hazardous waste was disposed of without a permit, in accordance with OAC rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20. Within 30 days after the effective date of these Orders, Respondents shall submit to Ohio EPA a closure plan, prepared in accordance with OAC rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20.

2. The closure plan referenced in Order No. 1 is subject to Ohio EPA review and approval. If Ohio EPA does not approve the closure plan, and provides Respondents with a written statement of deficiencies, Respondents shall, within 30 days after receipt of such written statement, revise the closure plan or submit a new closure plan to Ohio EPA addressing the deficiencies. After receipt of Respondents' new or revised closure plan, Ohio EPA will notify Respondents in writing that Ohio EPA either approves the closure plan or approves the closure plan with modifications. If Ohio EPA modifies the closure plan, the modified closure plan shall become the approved closure plan.

3. Upon receiving Ohio EPA's written approval of the closure plan, Respondents shall implement the approved closure plan pursuant to the specifications and schedules contained in the approved closure plan, any modifications attached to the approved closure plan, and OAC rules 3745-55-13/3745-66-13.

4. Within 60 days after completion of closure, Respondents shall submit to Ohio EPA a closure certification in accordance with OAC rules 3745-55-15/3745-66-15.

5. Within 60 days after the effective date of these Orders, Respondents shall submit to Ohio EPA a closure cost estimate and documentation demonstrating that Respondents have established financial assurance and liability coverage for closure in accordance with OAC rules 3745-55-42/3745-66-42 through 3745-55-47/3745-66-47.

6. Within thirty (30) days from the effective date of these Orders, Respondents shall pay to Ohio EPA the amount of $94,762.50.00 in settlement of Ohio EPA's claims for civil penalties which may be assessed for noncompliance pursuant to ORC Chapter 3734. and which will be deposited into the hazardous waste

cleanup fund established pursuant to ORC § 3734.28. Payment shall be made by tendering a certified check for $94,762.50 to Ohio EPA, Department 631, Columbus, Ohio 43265-0631, made payable to "Treasurer, State of Ohio." A copy of this check shall be submitted in accordance with Section IX of these Orders.

VI. TERMINATION

The Respondents' obligations under these Orders shall terminate when the Respondents demonstrate in writing and certify to the satisfaction of Ohio EPA that all obligations under these Orders have been performed and Ohio EPA's Division of Hazardous Waste Management acknowledges, in writing, Ohio EPA's acceptance of this demonstration and certification.

This certification shall be submitted by the Respondents and shall be signed by a responsible official of the Respondents. The certification shall make the following attestation: "I certify that the information contained in or accompanying this certification is true, accurate and complete."

For purposes of these Orders, a responsible official is a corporate officer who is in charge of a principal business function of the Respondents.

VII. OTHER CLAIMS

Nothing in these Orders shall constitute or be construed as a release from any claim, cause of action or demand in law or equity against any person, firm, partnership or corporation, not a signatory to these Orders, for any liability arising out of or relating to the operations of the Respondents' Facility.

VIII. OTHER APPLICABLE LAWS

All actions required to be taken pursuant to these Orders shall be undertaken in accordance with the requirements of all applicable local, state and federal laws and regulations. Nothing in these Orders shall be construed as waiving or compromising in any way the applicability and enforcement of any other statutes or regulations applicable to the Respondents' operation of the Facility. Ohio EPA reserves all rights and privileges except as specified herein.

IX. NOTICE

All documents demonstrating compliance with these Orders, and other documents required under these Orders to be submitted to Ohio EPA, shall be addressed to:

Ohio Environmental Protection Agency
Northwest District Office
Division of Hazardous Waste Management
Attn: DHWM Manager
347 North Dunbridge Road
Bowling Green, OH 43402

and Ohio EPA Central Office at the following address:

or to such persons and addresses as may hereafter be otherwise specified in writing by Ohio EPA.

X. RESERVATION OF RIGHTS

Nothing contained herein shall be construed to prevent Ohio EPA from seeking legal or equitable relief to enforce the terms of these Orders or from taking administrative, legal or equitable action as deemed appropriate and necessary, including seeking penalties against the Respondents for noncompliance with these Orders. Nothing contained herein shall be construed to prevent Ohio EPA from exercising its lawful authority to require the Respondents to perform additional activities, including closure of additional hazardous waste management units at the Facility, pursuant to ORC Chapter 3734. or any other applicable law in the future. Nothing herein shall restrict the right of the Respondents to raise any administrative, legal or equitable claim or defense with respect to such further actions which Ohio EPA may seek to require of the Respondents. Nothing in these Orders shall be construed to limit the authority of Ohio EPA to seek relief for violations not addressed in these Orders.

XI. SIGNATORIES

Each undersigned representative of a signatory to these Orders certifies that he or she is fully authorized to enter into these Orders and to legally bind such signatory to this document.

XII. WAIVER

In order to resolve disputed claims, without admission of fact, violation or liability, and, subject to Section X of these Orders, in lieu of further enforcement action by Ohio EPA for only the violations addressed in these Orders, the Respondents agree that these Orders are lawful and reasonable, that the times provided for compliance herein are reasonable and that the Respondents agree to comply with these Orders. Subject to Section X., above, compliance with these Orders shall be a full accord and satisfaction for the Respondents' liability for the violations cited herein.

The Respondents hereby waive the right to appeal the issuance, terms and

service of these Orders and hereby waive any and all rights they might have to seek administrative or judicial review of these Orders either in law or equity.

Notwithstanding the preceding, Ohio EPA and the Respondents agree that in the event that these Orders are appealed by any other party to the Environmental Review Appeals Commission, or any court, the Respondents retain the right to intervene and participate in such appeal. In such an event, the Respondents shall continue to comply with these Orders notwithstanding such appeal and intervention unless these Orders are stayed, vacated or modified.

Company Name: Campbell Soup Supply Company, L.L.C.
Description of Violation: Failure to Evaluate Waste, Illegal Storage, Treatment and Disposal of Hazardous Waste
Citation: OAC 3745-52-11, ORC 3734.02(E)

Part I - Gravity

	INITIAL	REVISION	FINAL
Potential for Harm:	Minor/Moderate/**Major**		Minor/Moderate/Major

Justification: Campbell failed to evaluate the coating material waste. Campbell illegally stored, treated, and disposed of hazardous waste into two unpermitted holding pits, resulting in soil contamination at least 10 feet below grade.

Extent of Deviation:	Minor/Moderate/**Major**	Minor/Moderate/Major

Justification: Campbell's stored, treated and disposed of hazardous waste without a hazardous waste permit.

Matrix Cell Range:	$8000-$10,000	$
(A) Penalty Amount Determined	$10,000	$

Part II - Multi-Day Penalty

(B) # of Days of Violation - 180

Multi-Day Matrix Cell Range:	$400-2000	$
(C) Multi-Day Penalty Amount Determined:	$650	$

(D) Multi-Day Penalty = 179 X $650 = $116,350
[(B)-1]x(C)

Total Penalty = (A) + (D) $126,350

25% adjustment downward for self-reporting = $94,762.50

Re: Henry County
Campbell's Soup Company
OHD 005419171
Hazardous Waste

August 10, 2000

Mr. Michael Maringer
Manager, Service and Utilities
Campbell's Soup Company
East Maumee Avenue
Napoleon, Ohio 43545

Dear Mr. Maringer:

On June 30, 2000, this office received a report from Campbell's Soup Company (Campbell's) entitled RCRA Site Closure Investigation Work Plan: Former Holding Pit Area. Ohio EPA has reviewed the document and offers the following comments:

1. Campbell's has not identified the full horizontal or vertical range of contamination. Sample data submitted shows the majority of samples were taken at depths of 9.5 to 10 feet, with no samples taken from 0 to 6 feet. It is possible that contamination exists in more shallow soils beyond the boundaries of Campbell's sampling. Therefore, a more thorough investigation needs to be conducted.

   Samples at each prior boring must be taken at shallower depths than 10 feet. It is probable that contamination may exist in soil at depths from 6-8 feet, for example, but not at 10 feet. For this reason, a non-detect value at 10 feet alone cannot be used to determine the horizontal extent of contamination. Taking samples from 3, 6, and 12 feet below grade is acceptable. However, the deeper sample to be held at the laboratory should be taken from 14, not 16, feet.

2. Only advancing additional borings at sample numbers PB-23 through 26 is unacceptable. The full vertical extent of contamination from the former holding pits must be defined. The highest concentrations of contaminants could be found in soils between 4 to 8 feet below grade, yet the work plan only calls for additional sampling at 9 borings. Samples from all previous and future sampling points must be taken from 3, 6, 12 (9-10 foot interval having already been sampled), and 14 feet below grade.

3. Campbell's proposal to remove contaminated soils to another unimpacted area for the purpose of phytoremediation is not acceptable to Ohio EPA. The placement of soils from the former holding pit area onto unimpacted ground would constitute creation of a waste pile and require the submission of a RCRA Part B permit application for the waste pile.

Printed on recycled paper

4. No details of how the samples were taken (other than saying samples were taken with a Geoprobe) is included in the report. Sampling protocol information must be provided to Ohio EPA in future submissions. Sampling results without this information will not be accepted for closure purposes.

5. The presence of naphthalene (a common ingredient in many industrial solvents) in samples from the December 1999 sampling event indicates semi-volatile organic compound (SVOCs) contamination. All samples should be analyzed for the presence of SVOCs as well as VOCs.

6. Figure 4 of the February 2000 limited investigation document does not include all soil contamination listed in Table 2 of said document. Acetone was found at 70.6 ug/kg at PB-17 and 63.5 ug/kg at PB-12; methyl ethyl ketone was found at 62.6 ug/kg at PB-11; total xylenes were found at 11.4 ug/kg at PB-01 and 38.4 (at 10 feet) at PB-15; ethylbenzene was found at 9.1 ug/kg (at 10 feet) at PB-15.

7. The sections dedicated to site geology and hydrogeology (section 2.3 and 2.4) will need to be much more detailed in the closure plan. For example, Campbell's must determine occurrence of the uppermost saturated unit, i.e., the occurrence of saturated conditions below the unit.

8. Campbell's must determine the vertical impact of soil contamination. Campbell's should leave the borings in the unit open to allow for infiltration of groundwater, if any. This would go to prove the occurrence of shallow groundwater.

9. If soil is impacted at concentrations greater than the Method Detection Limit (MDL) for VOCs at or below the shallow groundwater table, a complete groundwater investigation must be performed.

10. Section 3.1 of the work plan states that groundwater was not encountered in any borings at 12 feet. Campbell's should explain upon what evidence this conclusion is based.

11. A literature search is insufficient to determine local occurrence of groundwater. Campbell's must perform more sampling and obtain site specific information for the occurrence of groundwater.

12. Campbell's should be prepared to collect groundwater samples from the Geoprobe borings for VOCs and SVOCs, if groundwater occurs.

This review should not be construed to constitute a complete review of Campbell's closure plan for the former holding pit area. The plan will be addressed in detail in future correspondence.

This review did not include joint review by Ohio EPA's Division of Drinking and Ground Waters. If you have any questions, feel free to contact me.

Sincerely,

Michael R. Terpinski

Dear Mr. Terpinski:

This is in response to your letter dated May 16, 2000, concerning Campbell Soup Company's report entitled "Limited Subsurface Soil Investigation; Former Holding Pit Area". We have developed a Work Plan for delineation of the contaminated soil at the above site that has considered all the comments presented in your letter. Enclosed, please find a copy of the "RCRA Site Closure Investigation Work Plan Former Holding Pit Area", June 16, 2000, prepared by HIS Geotrans, Ann Arbor, Michigan.

We would like to arrange a meeting with you in your office to discuss any comments you may have in order to implement the plan in a timely manner.

Please call me for a meeting date at your discretion. I can be contacted at 419-592-1010 extension 6343.

Sincerely,

CAMPBELL SOUP COMPANY

M. N. Maringer

Re: Henry County, Campbell Soup Company, Hazardous Waste Notice of Violation, OHD 987046703, OHD 987023678, and OHD 005419171.

Dear Mr. Michael R. Terpinski:

This is in response to the notice of violation letter dated May 16, 2000. The following is our response and further explanation of the events that took place involving the temporary holding pit area.

Spent solvent from the former can manufacturing operations at the Napoleon Plant was stored in 55-gallon drums and eventually used as a boiler fuel supplement (Boiler and Industrial Furnace 'BIF' Small Quantity Burner Exemption). Over time solids accumulated in the drums made it difficult to handle. To alleviate the solids, two earth dikes were constructed using a natural clay liner and compacted. The overall dimensions totaled approximately 20 feet wide by 35 feet long, with a depth of 2 ½ feet.

This practice was discontinued and the partially filled dikes were decommissioned in 1983. A local contractor using sand and natural soil excavated the dikes and hauled the material to the Evergreen Landfill for disposal. The material was analyzed by Evergreen at the landfill for disposal.

The earthen dikes were a one-time construction to remove semi-liquid solids from the drums. The practice was discontinued in 1983 with the excavation of the dikes.

We became aware of this practice, as we indicated in our March 23rd, 2000 meeting with you, and we immediately conducted an assessment of the area that resulted in the report we submitted to you.

Campbell Soup plans to conduct a complete investigation to delineate the contamination in the former holding pit area. A work plan will be submitted to your office for review and approval before implementation. We, also, shall submit a closure plan for hazardous waste storage and disposal area, to the Ohio EPA as is required by the applicable regulations.

We will call your office to arrange for a meeting to discuss the work plan and the various closure strategies.

Sincerely,

M. N. Maringer

Hazardous Waste
Notice of Violation

May 16, 2000

Mr. Michael Maringer
Manager, Service and Utilities
Campbell's Soup Company
East Maumee Avenue
Napoleon, Ohio 43545

Dear Mr. Maringer:

On March 23, 2000, a meeting between Campbell's and the Ohio Environmental Protection Agency (Ohio EPA) was held at Ohio EPA's Northwest District Office (NWDO). Campbell's was represented by Dr. Osman Aly and yourself. Ohio EPA was represented by Lorma Wendt (DHWM) and myself.

The following information was revealed during the March 23, 2000 meeting:

> While responding to an Ohio EPA request for information relating to the Imthurn drum site investigation, Campbell's conducted numerous employee interviews. These interviews led to the discovery of another predicament from Campbell's past.
>
> Campbell's is a manufacturer of soups, sauces, pork and beans, Splash fruit and vegetable juice, and V-8 vegetable juice. Cans were manufactured on-site until July 1998. Coating machines applied a rust inhibitor, similar to an enamel paint, to the 2-piece steel cans to increase durability. The coating machines needed periodic cleaning (performed with solvents classified as both listed and characteristically-hazardous wastes), thus generating hazardous waste.
>
> The coating material waste consisted of two phases; a liquid phase and a sludge-like phase. Approximately 2000 of these drums from the canning plant were stored on-site behind the container plant on a concrete pad. Dr. Aly stated that during the energy crisis of the late 1970s, Mr. Ellis Imthurn approached Campbell's and asked if he could have the drums to use the waste to fuel the boilers in the abandoned school in which he resided. Dr. Aly stated that this was a one-time agreement that concluded in 1979. According to both Dr. Aly and yourself, the drums were simply stored on-site at the Napoleon plant from 1980 to 1981. According to Campbell's, the liquid phase was either burned directly in Campbell's boilers or placed on a coal pile, then burned in the boilers from 1981 to January 1993.

The semi-solid phase of this waste was not amenable to burning. Therefore, too many drums of the combined waste were being generated (you stated that approximately 22 to 100 gallons of the liquid phase waste was poured on the coal pile per month). The liquid phase was siphoned off and burned in the boilers. The semi-solid phase was dumped into two on-site holding pits from 1981 to 1983. The pits were reportedly lined with natural clay that was obtained on-site and compacted prior to placement of any sludges. You stated that the pits totaled approximately 20 feet by 40 feet and were 2½ to 3 feet deep. There was roughly 2 feet of waste in each pit. In 1983, the material was excavated and disposed of at Evergreen Landfill in Northwood, Ohio. The sludge was mixed with sand prior to off-site disposal.

The coating material waste was classified as a hazardous waste because of its ignitability. However, soil sampling data from the former pit area shows concentrations of compounds (xylene, acetone, methyl isobutyl ketone, ethyl benzene, and methyl ethyl ketone) typically found in F-listed hazardous wastes. Material Safety Data Sheets (MSDSs) for the coating materials and solvents used at the Napoleon plant in the early 1980s provided by Campbell's on April 21, 2000, confirms the presence of these materials. Therefore, the materials disposed of in the holding pit were listed hazardous wastes as well.

On December 2 and 3, 1999, HSI GeoTrans conducted sampling at the former holding pit area. The area was identified based on interviews with Campbell's employees. The results of the sampling were presented in a report titled Limited Subsurface Soil Investigation: Former Holding Pit Area received March 23, 2000. The report shows residual volatile organic chemical (VOC) contamination at depths as great as 10 feet below ground surface as a result of Campbell's former waste management techniques.

Because Campbell's has performed unpermitted treatment (evaporation of materials dumped in the holding pits), storage (from 1980 to 1981), and disposal (from 1981-1983) of hazardous waste, they are in violation of the following hazardous waste law:

1. Chapter 3734.02 (E) of the Ohio Revised Code states in part that: "[N]o person shall establish or operate a hazardous waste facility, or use a solid waste facility for the storage, treatment, or disposal of any hazardous waste, without a hazardous waste facility installation and operation permit from the hazardous waste facility board..."

   Campbell's storage of hazardous waste on-site from 1980 to 1981 constitutes unpermitted storage of hazardous waste. Campbell's is a Large Quantity Generator (LQG) of hazardous waste, and may only store waste on-site for ninety (90) days.

   When the semi-solid hazardous wastes were dumped into the holding pits on Campbell's property, they dried and were mixed with sand prior to off-site disposal at Evergreen Landfill in Northwood, Ohio. This evaporation constitutes unpermitted treatment of hazardous waste. The mixing of this material with sand may also constitute unpermitted treatment if the sand were introduced before the waste hardened.

The hazardous wastes dumped into on-site holding pits at Campbell's from 1981 to 1983 also constitutes improper disposal of hazardous waste. Campbell's does not have a RCRA Part B permit allowing for the treatment, storage, or disposal of hazardous waste.

Please respond, in writing, to this Notice of Violation (NOV) within ten (10) days. Your response must include all actions and timetables necessary to demonstrate compliance. *In addition, a copy of the closure plan for the hazardous waste storage and disposal areas must be submitted to Ohio EPA, NWDO within ninety (90) days of receipt of this letter.* Please call me to arrange a meeting to discuss the document entitled Limited Subsurface Soil Investigation: Former Holding Pit Area. The meeting will also be helpful in discussing various closure strategies available to Campbell's.

Failure to list specific deficiencies in this letter does not relieve you from the responsibility of complying with all applicable regulations.

If you have any questions, feel free to contact me at 419-373-3070.

Sincerely,

Michael R. Terpinski

Dear Mr. Terpinski:

Per our telephone discussion, please find enclosed a copy of all the available MSDS date sheets for the coating materials and solvents used at our Napoleon Plant during the early 1980's.

The sludges from some of the spent materials but not all of them is expected to have been temporarily stored in the on-site holding pit.

Please give me a call at 856-968-4423 if you have any questions.

Sincerely,

CAMPBELL SOUP COMPANY

V. HEALTH HAZARD DATA

Effects of Overexposure:

Ingestion: No specific information available.

Contains materials that may be moderately toxic.

Inhalation: No specific information available.

Contains materials that have the potential to cause headaches, nausea, dizziness, and respiratory irritation if inhaled.

Skin Absorption: No specific information available.

Contains materials that may be moderately toxic.

Skin Contact: No specific information available.

Contains materials that may cause moderate skin injury (reddening and swelling).

Eye Contact: No specific information available.

Contains materials that may cause severe eye injury -- damage reversible.

Chronic Effects of Overexposure: No specific information available.

Contains solvents which are reported to be associated with central nervous system damage after repeated and prolonged use.Contains solvents which may cause injury to liver, kidneys, bone marrow and blood cells after repeated overexposure. A lifetime inhalation study indicated animals exposed to levels of formaldehyde above TLV developed nasal cancer. Studies of occupationally exposed workers have shown no evidence of chronic effects such as cancer. Formaldehyde is listed by NTP and IARC.

Emergency & First Aid Procedures:

Eye Contact:

Flush with plenty of water for at least 15 minutes and seek medical attention.

Skin Contact:

Remove contaminated clothing and wash contact area with soap and water for 15 minutes.

Ingestion:

If appreciable quantities are swallowed, seek medical attention.

Inhalation:

In case of exposure to a high concentration of vapor or mist, remove person to fresh air. If breathing has stopped, administer artificial respiration and seek medical attention.

VI. SPILL OR LEAK PROCEDURES

Steps to Be Taken in Case Material Is Released or Spilled:

Dike spill. Absorb with inert material and collect for disposal. Flush area with water. Prevent washings from entering waterways. Spills may be reportable to the National Response Center (800-424-8802).

Waste Disposal Method:

Incinerate or use biological treatment in accordance with federal, state, and local regulations. This material is a hazardous waste under current RCRA regulations because of ignitability.

VII. SPECIAL PROTECTION INFORMATION

Respiratory Protection:

Wear a properly fitted NIOSH/MSHA approved respirator whenever exposure to vapor/mist is likely unless levels are below applicable limits.

Ventilation:

Local Exhaust - Recommended when appropriate to control employee exposure.

Mechanical - Not recommended as the sole means of controlling employee exposure.

Protective Gloves: For operations where contact can occur, wear impervious gloves (Neoprene).

Eye Protection: Chemical splash goggles.

Other Protective Equipment: For operations where contact can occur, a safety shower and eye wash facility should be available.

VIII. SPECIAL PRECAUTIONS

Avoid contamination of skin. Store above 40 F. DO NOT FREEZE. Do not apply to hot surfaces or use in areas where exposed to electric sparks. Keep away from fire and open flame. Ground containers when transferring from one to another. There is a potential for some release of formaldehyde during drying and curing operations. Oven designs usually provide for adequate exhaust, but you must review actual characteristics of your operations.

Product Class: Waterborne Modified Epoxy Can Lining

Manufacturer's I.D. : 029W054

D.O.T. Hazard Class: Combustible Liquid
D.O.T. Shipping Name: Combustible Liquid N.O.S.
D.O.T. UN Number: NA 1993

Evaporation Rate: Slower than Butyl Acetate

Percent Volatile by Volume: 72 **VOC:** 203.7 g/l

Boiling Range: 212-442 F

Vapor Density: Heavier than air

Weight Per Gallon: 8.7 lb.

Vapor Pressure at 20 C: <20 mm Hg

Solubility in Water: Miscible

Appearance and Odor: Opaque white mobile liquid with characteristic solvent odor

II. HAZARDOUS INGREDIENTS

	CAS #	WT. %	OSHA TWA ppm	OSHA STEL ppm	ACGIH TWA ppm	ACGIH STEL ppm
Bisphenol-A based epoxy resin	25068-38-6	23	---	---	---	---

Formaldehyde	50-00-0	<0.01	3 5 Ceiling 10 ppm (30 minutes)	---	1	2

*Potential contribution to overall exposure is possible via skin absorption.
--- Not established

III. FIRE & EXPLOSION DATA

Flashpoint: 123 F Setaflash **LEL:** <1.4 est.

Extinguishing Media:

Use carbon dioxide or dry chemical for small fires; aqueous foam or water for large fires.

Unusual Fire & Explosion Hazards:

Closed containers may explode (due to buildup of pressure) when exposed to extreme heat.

Special Fire Fighting Procedures:

Remove all ignition sources. Wear self-contained breathing apparatus and complete personal protective equipment when entering confined areas where potential for exposure to vapors or products of combustion exists.

IV. REACTIVITY DATA

Stability: Stable **Hazardous Polymerization:** Will not occur

Conditions to Avoid:

Excessive heat.

Materials to Avoid:

No specific information available.

Hazardous Decomposition Products:

Fumes produced when heated to decomposition may include: carbon monoxide, carbon dioxide, oxides of nitrogen, formaldehyde.

To the best of our knowledge, the information contained herein is accurate. However Hi-Tek Polymers, Inc. does not assume any liability whatsoever for the accuracy or completeness of the information contained herein. Final determination of suitability of any material is the sole responsibility of the user. All materials may present unknown health hazards and should be used with caution. Although certain hazards are described herein, we cannot guarantee that these are the only hazards that exist.

V. HEALTH HAZARD DATA

Effects of Overexposure:

Ingestion: No specific information available.

Contains materials that may be slightly toxic.

Inhalation: No specific information available.

Contains materials that have the potential to cause headaches, nausea, dizziness, and respiratory irritation if inhaled.

Skin Absorption: No specific information available.

Contains materials that may be moderately toxic.

Skin Contact: No specific information available.

Contains materials that may cause moderate skin injury (reddening and swelling).

Eye Contact: No specific information available.

Contains materials that may cause severe eye injury -- damage reversible.

Chronic Effects of Overexposure: No specific information available.

Contains solvents which may cause injury to liver, kidneys, bone marrow and blood cells after repeated overexposure.A lifetime inhalation study indicated animals exposed to levels of formaldehyde above TLV developed nasal cancer. Studies of occupationally exposed workers have shown no evidence of chronic effects such as cancer. Formaldehyde is listed by NTP and IARC. Contains solvents which are reported to be associated with central nervous system damage after repeated and prolonged use.

Emergency & First Aid Procedures:

Eye Contact:

Flush with plenty of water for at least 15 minutes and seek medical attention.

Skin Contact:

Remove contaminated clothing and wash contact area with soap and water for 15 minutes.

Ingestion:

If appreciable quantities are swallowed, seek medical attention.

Inhalation:

In case of exposure to a high concentration of vapor or mist, remove person to fresh air. If breathing has stopped, administer artificial respiration and seek medical attention.

VI. SPILL OR LEAK PROCEDURES

Steps to Be Taken in Case Material Is Released or Spilled:

Dike spill. Absorb with inert material and collect for disposal. Flush area with water. Prevent washings from entering waterways. Spills may be reportable to the National Response Center (800-424-8802).

Waste Disposal Method:

Incinerate or use biological treatment in accordance with federal, state, and local regulations. This material is a hazardous waste under current RCRA regulations because of ignitability.

VII. SPECIAL PROTECTION INFORMATION

Respiratory Protection:

Wear a properly fitted NIOSH/MSHA approved respirator whenever exposure to vapor/mist is likely unless levels are below applicable limits.

Ventilation:

Local Exhaust - Recommended when appropriate to control employee exposure.

Mechanical - Not recommended as the sole means of controlling employee exposure.

Protective Gloves: For operations where contact can occur, wear impervious gloves (Neoprene).

Eye Protection: Chemical splash goggles.

Other Protective Equipment: For operations where contact can occur, a safety shower and eye wash facility should be available.

VIII. SPECIAL PRECAUTIONS

Avoid contamination of skin. Store above 40 F. DO NOT FREEZE. Do not apply to hot surfaces or use in areas where exposed to electric sparks. Keep away from fire and open flame. Ground containers when transferring from one to another. There is a potential for some release of formaldehyde during drying and curing operations. Oven designs usually provide for adequate exhaust, but you must review actual characteristics of your operations.

IX. STATE R-T-K COMPOSITION INFORMATION

XI. California Proposition 65 Information

This product contains the following chemicals that have been designated as cancer and/or reproductive hazards under California Proposition 65.

Component	CAS #	Wt %
Formaldehyde	50-00-0	<0.01

XII. Other Information

All components of this product are listed on the TSCA registry.

This notification may not be detached from the MSDS. Any copying and redistribution of the MSDS shall also include copying and redistribution of this notice as per 53 FR 4500, Feb. 16, 1988.

SECTION VI - REACTIVITY DATA

MATERIAL IS UNSTABLE UNDER NON-EMERGENCY CONDITIONS.

HAZARDOUS POLYMERIZATION MAY OCCUR.

HAZARDOUS DECOMPOSITION PRODUCTS: Oxides of carbon, various hydrocarbons, aldehydes, acids, hydrogen fluoride.

CONDITIONS TO AVOID: heat, open flame, sparks. Storage 6 months past container date.

MATERIALS TO AVOID: alkali, acids, oxidizers, water amines.

SECTION VII - SPILL AND LEAD PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED: Remove all sources of ignition. Wear appropriate safety equipment as listed in section VIII; assume for all Hazardous ingredients listed in section II, that TLV, PEL and LEL limits will be exceeded. Absorb on inert material and dispose of as below.

WASTE DISPOSAL METHOD: Dispose of in accordance with Federal, State and local regulations.

SECTION VIII - SAFE HANDLING AND USE INFORMATION

RESPIRATORY PROTECTION: Wear an appropriate, properly fitted respirator (NIOSH/MSHA approved) during and after application unless air monitoring demonstrates vapor/mist levels are below application limits. Follow respirator manufacturer's directions for respirator use.

VENTILATION: Sufficient ventilation must be provided to maintain airborne concentrations below TLV, PEL and LEL limits, as listed in section II.

PROTECTIVE GLOVES: Synthetic or rubber gloves are recommended as a good personal hygiene practice.

EYE PROTECTION: Safety glasses with side shields should be worn.

OTHER PROTECTIVE EQUIPMENT: Eye bath and safety shower should be provided.

HYGIENIC PRACTICES: Good personal hygiene practices are required at all times when handling chemicals. These practices include, but are not limited to washing when safety equipment is removed, at the end of each shift or when going on breaks and especially if contamination occurs.

SECTION IX - SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORAGE: Keep containers closed when not in use. Use oldest inventory first. Store in a clean, dry area. Store below 100 degrees Fahrenheit. Avoid exposure to light. Store away form ignition sources.

OTHER PRECUATIONS: Empty container may retain product resides (vapor or liquid). All precautions must be observed.

DISCLAIMER: While RELIANCE UNIVERSAL - ZION believes that the data contained herein are accurate and derived from qualified sources the data are not to be taken as a warranty or representation for which RELIANCE UNIVERSAL - ZION assumes legal responsibility. They are offered solely for your consideration, investigation and verification. Any use of these data and information must be determined by the user to be in accordance with applicable Federal, State and local laws and regulations.

1.1

EXTINGUISHING MEDIA
CARBON DIOXIDE, DRY CHEMICAL OR FOAM.

UNUSUAL FIRE AND EXPLOSION HAZARDS
CLOSED CONTAINERS MAY EXPLODE WHEN EXPOSED TO EXTREME HEAT OR FIRE.
VAPORS MAY IGNITE.

IAL FIRE FIGHTING PROCEDURES
WATER MAY BE INEFFECTIVE ON FIRE BUT WATER SPRAY MAY BE USED TO COOL CLOSED CONTAINERS EXPOSED TO EXTREME HEAT OR FIRE TO PREVENT PRESSURE BUILD-UP AND POSSIBLE AUTOIGNITION OR EXPLOSION.

Section V — HEALTH HAZARD DATA

THRESHOLD LIMIT VALUE: NONE ESTABLISHED FOR THIS PRODUCT. SEE SECTION II.

EFFECTS OF OVEREXPOSURE: IRRITATION OF EYES, SKIN, AND RESPIRATORY TRACT.
POSSIBLE DERMATITIS ON REPEATED AND PROLONGED SKIN CONTACT.
HEADACHE AND DIZZINESS LIKELY WITH VAPOR INHALATION.

EMERGENCY AND FIRST AID PROCEDURES

INHALATION: MOVE PERSON TO WELL VENTILATED AREA. RESTORE BREATHING. GET MEDICAL ATTENTION.
SKIN CONTACT: WIPE WITH CLEAN CLOTH, WASH THOROUGHLY WITH SOAP AND WATER.
EYE CONTACT: FLUSH THOROUGHLY WITH WATER, GET MEDICAL ATTENTION.
INGESTION: GET MEDICAL ATTENTION IMMEDIATELY.

Section VI — REACTIVITY DATA

STABILITY ☐ UNSTABLE ☒ STABLE CONDITIONS TO AVOID

INCOMPATABILITY (Materials to avoid) NONE KNOWN.

HAZARDOUS DECOMPOSITION PRODUCTS

CARBON MONOXIDE, CARBON DIOXIDE, POSSIBLE OXIDES OF NITROGEN.

HAZARDOUS POLYMERIZATION ☐ MAY OCCUR ☒ WILL NOT OCCUR

CONDITIONS TO AVOID

Section VII — SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED

REMOVE ALL SOURCES OF IGNITION. VENTILATE AREA. MOP SPILLS WITH INERT ABSORBENT.

WASTE DISPOSAL METHOD

SPOSE IN ACCORDANCE WITH ALL APPLICABLE REGULATIONS. DO NOT INCINERATE CLOSED CONTAINERS.

Section VIII — SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION

USE NIOSH APPROVED RESPIRATOR WITH CHEMICAL-MECHANICAL FILTER.
IN CONFINED AREAS USE APPROVED SUPPLIED AIR APPARATUS.

VENTILATION

PROVIDE DILUTION VENTILATION OR LOCAL EXHAUST TO PREVENT BUILD-UP OF VAPORS.

PROTECTIVE GLOVES: SOLVENT RESISTANT GLOVES.
EYE PROTECTION: SPLASH PROOF GOGGLES.
OTHER PROTECTIVE EQUIPMENT: IMPERVIOUS CLOTHING.

Section IX — SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORING

STORE BELOW 100 DEGREES F. KEEP CONTAINERS CLOSED AND UPRIGHT WHEN NOT IN USE.
KEEP AWAY FROM HEAT, SPARKS, AND OPEN FLAME.

OTHER PRECAUTIONS

AVOID PROLONGED CONTACT WITH SKIN OR BREATHING OF VAPOR.
DO NOT TAKE INTERNALLY.
: ONLY WITH ADEQUATE VENTILATION.
OR PROFESSIONAL USE AND APPLICATION ONLY.

DATE OF PREP. 2-18-85

Section III—PHYSICAL DATA

BOILING RANGE (°F): 208-340 VAPOR DENSITY: [xx] HEAVIER [ ] LIGHTER THAN AIR

EVAPORATION RATE: [ ] FASTER [xx] SLOWER THAN ETHER PERCENT VOLATILE BY VOLUME: 42 WEIGHT PER GALLON: 8.4

Section IV—FIRE AND EXPLOSION HAZARD DATA

FLAMMABILITY CLASSIFICATION: COMBUSTIBLE OSHA Class II FLASH POINT (SETAFLASH): 122 °F LEL 2.4

EXTINGUISHING MEDIA: Carbon dioxide, dry chemical, foam.

UNUSUAL FIRE AND EXPLOSION HAZARDS: Keep containers tightly closed. Avoid sources of ignition. Ground all transfer equipment. Closed containers may explode when exposed to extreme heat.

SPECIAL FIRE FIGHTING PROCEDURES: Water spray (fog nozzles) may be used for cooling closed containers. Full protective equipment should be used by firefighters to protect them from hazardous decomposition products listed in Section VI.

Section V—HEALTH HAZARD DATA

THRESHOLD LIMIT VALUE: SEE SECTION II

EFFECTS OF OVEREXPOSURE:
Severe eye irritation, drying of skin.
Excessive inhalation causes headache, dizziness, nausea.

EMERGENCY AND FIRST AID PROCESURES: In case of skin contact, wash thoroughly with soap and water; for eyes, flush immediately with plenty of water for 15 minutes and call a physician. Remove and wash contaminated clothing before reuse. If exposed to high concentration of vapor remove patient to fresh air. If swallowed, CALL A PHYSICIAN IMMEDIATELY. INDUCE VOMITING.

Section VI—REACTIVITY DATA

STABILITY: ☐ UNSTABLE ☒ STABLE
INCOMPATIBILITY (Materials to avoid): Strong oxidizing agents.
HAZARDOUS DECOMPOSITION PRODUCTS: As with any organic chemical, thermal decomposition will yield carbon dioxide and probably carbon monoxide.
HAZARDOUS POLYMERIZATION ☐ MAY OCCUR ☒ WILL NOT OCCUR
CONDITIONS TO AVOID: Sources of ignition, high temperatures.

Section VII—SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED: Remove sources of ignition, ventilate and remove with inert absorbent.
WASTE DISPOSAL METHOD: Incinerate in approved facility in accordance with local, state and federal regulations. Do not incinerate closed container.

Section VIII—SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION: NIOSH approved respiratory device may be used. But, under normally well ventilated conditions no respiratory problems may be expected.

VENTILATION: All application areas should be ventilated in accordance with OSHA regulations.

PROTECTIVE GLOVES: Recommended.

EYE PROTECTION: Use approved safety eyewear with splash guards.

OTHER PROTECTIVE EQUIPMENT: Safety shower and eye bath.

Section IX—SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORING: Keep away from heat, sparks and open flame. Use only with adequate ventilation. Since emptied containers retain product residue (vapor c liquid), all labeled hazard precautions must be observed.

OTHER PRECAUTIONS: Avoid prolonged or repeated breathing of vapor or spray mist. Avoid contact with eyes and skin. Do not take internally.

The information contained herein is furnished without warranty of any kind. Employers should use this information only as a supplement to other information gathered by them and must make independent determinations of suitability and completeness of information from all sources to assure proper use of these materials and the safety and health of employees.

Any use of these data and information must be determined by the user to be in accordance with applicable Federal, State, and local laws and regulations.

IV. HEALTH HAZARD DATA

.ESHOLD LIMIT VALUE	200 ppm. ACGIH (1977) OSHA CFR 29§1000 Table G1
EFFECTS OF OVEREXPOSURE	Irritation of nose, throat, and eyes. Headache, nausea, vomiting.
EMERGENCY AND FIRST AID PROCEDURES	Remove to fresh air and call a physician. Flush skin and eye contact with water. If swallowed, induce vomiting and call a physician.

V. REACTIVITY DATA

STABILITY			
UNSTABLE	STABLE	CONDITIONS TO AVOID	None
—	√		

INCOMPATIBILITY (materials to avoid)	Avoid alkaline materials, mineral acids, halogens
:ARDOUS .OMPOSITION PRODUCTS	Burning can produce carbon monoxide and/or carbon dioxide.

HAZARDOUS POLYMERIZATION			
May Occur	Will not Occur	CONDITIONS TO AVOID	None
—	√		

VI. SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IF MATERIAL IS RELEASED OR SPILLED	Eliminate all sources of ignition. Wear suitable protective equipment. Collect for disposal. See Section VIII.
WASTE DISPOSAL METHOD	Incinerate in a furnace where permitted under appropriate Federal, State, and local regulations.

VII. SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION (specify type)		Air-supplied respirator in high concentrations		
VENTILATION	LOCAL EXHAUST	May be needed	SPECIAL	—
	MECHANICAL (general)	✓	OTHER	—
PROTECTIVE GLOVES		Rubber gloves	EYE PROTECTION	Safety glasses
OTHER PROTECTIVE EQUIPMENT		Safety shower and eye bath		

VIII. SPECIAL PRECAUTIONS

PRECAUTIONARY LABELING

METHYL ETHYL KETONE

WARNING! HARMFUL IF INHALED
FLAMMABLE
CAUSES EYE IRRITATION

Avoid breathing vapor.
Avoid contact with eyes.
Keep away from heat, sparks, and open flame.
Use with adequate ventilation.
Wash thoroughly after handling.

FIRST AID: If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Call a physician.

In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Call a physician.

FOR INDUSTRY USE ONLY

OTHER HANDLING AND STORAGE CONDITIONS

Incineration is the preferred method of disposal. It should also be feasible to treat very dilute solutions in a water treatment plant.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

	METHOD USED		LEL	UEL
FLASH POINT 67 °F °C	T.C.C.	FLAMMABLE LIMITS	1%	8%

EXTINGUISHING MEDIA CARBON DIOXIDE, DRY CHEMICAL, FOAM.

SPECIAL FIRE FIGHTING PROCEDURES USE NIOSH APPROVED SELF CONTAINED BREATHING APPARATUS. COOL EXPOSED CONTAINERS WITH WATER TO PREVENT PRESSURE BUILDUP AND/OR RUPTURE.

UNUSUAL FIRE AND EXPLOSION HAZARDS VAPORS ARE HEAVIER THAN AIR AND MAY TRAVEL TO A SOURCE OF IGNITION AND CAUSE FLASHBACK. VAPORS MAY SPREAD. PREVENT BUILDUP OF VAPORS. EXTINGUISH ALL PILOT LIGHTS, TURN OFF HEATERS, NON-EXPLOSION PROOF ELECTRICAL EQUIPMENT AND OTHER SOURCES OF IGNITION DURING USE AND UNTIL ALL VAPORS ARE GONE.

SECTION V - HEALTH HAZARD DATA

THRESHOLD LIMIT VALUE 50 PPM (ACGIH)	OTHER LIMIT 100 PPM (OSHA)
PERMISSIBLE EXPOSURE LIMIT 50 PPM	100 PPM (VENDOR)

EFFECTS OF OVEREXPOSURE - (CONDITIONS TO AVOID) INHALATION - IRRITATION OF THE RESPIRATORY TRACT; HEADACHE, NAUSEA, DIZZINESS, WEAKNESS AND FATIGUE. EXTREME EXPOSURE CAN RESULT IN UNCONSCIOUSNESS AND EVEN RESPIRATORY ARREST. EYE CONTACT - SEVERE IRRITANT. SKIN CONTACT - PROLONGED AND REPEATED LIQUID CONTACT CAN CAUSE DEFATTING AND DRYING OF SKIN, WHICH MAY RESULT IN SKIN IRRITATION AND DERMATITIS. CHRONIC: REPORTS HAVE ASSOCIATED REPEATED AND PROLONGED OCCUPATIONAL OVEREXPOSURE TO SOLVENTS WITH PERMANENT BRAIN AND NERVOUS SYSTEM DAMAGE. INTENTIONAL MISUSE BY DELIBERATELY CONCENTRATING AND INHALING THE CONTENTS MAY BE HARMFUL OR FATAL.

PRIMARY ROUTES OF ENTRY INHALATION, SKIN CONTACT, SWALLOWING

[illegible] AND SKIN. AVOID INHALATION - MOVE TO FRESH AIR. IF BREATHING BECOMES DIFFICULT, ADMINISTER OXYGEN. IF BREATHING CEASES, RESTORE USING APPROVED CPR TECHNIQUES AND SUMMON MEDICAL ASSISTANCE IMMEDIATELY. EYE CONTACT - FLUSH IMMEDIATELY WITH LARGE AMOUNTS OF WATER FOR AT LEAST 15 MINUTES. CONSULT A PHYSICIAN FOR MEDICAL TREATMENT. SKIN CONTACT - WASH AFFECTED AREAS WITH SOAP AND WATER. REMOVE SOILED CLOTHING. CONSULT A PHYSICIAN IF IRRITATION PERSISTS. INGESTION - DO NOT INDUCE VOMITING. CONSULT A PHYSICIAN IMMEDIATELY. ASPIRATION OF VOMITUS CAN CAUSE CHEMICAL PNEUMONITIS WHICH CAN BE FATAL.

NOTICE: INTENTIONAL MISUSE BY DELIBERATELY CONCENTRATING AND INHALING THE CONTENTS MAY BE HARMFUL OR FATAL.

SECTION VI - REACTIVITY DATA

STABILITY	UNSTABLE	CONDITIONS TO AVOID	HEAT, SPARKS, OPEN FLAME.
	STABLE XX		

INCOMPATIBILITY (MATERIALS TO AVOID) STRONG OXIDIZING AGENTS.

HAZARDOUS DECOMPOSITION PRODUCTS THERMAL DECOMPOSITION MAY YIELD CARBON MONOXIDE AND CARBON DIOXIDE.

HAZARDOUS	MAY OCCUR	CONDITIONS TO AVOID	NOT APPLICABLE
POLYMERIZATION	WILL NOT OCCUR XX		

SECTION VII - SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED REMOVE ALL SOURCES OF IGNITION (FLAMES, HOT SURFACES, AND ELECTRICAL STATIC OR FRICTIONAL SPARKS). AVOID BREATHING VAPORS. VENTILATE AREA. WEAR APPROPRIATE RESPIRATOR AND PROTECTIVE CLOTHING. DIKE AND CONTAIN SPILLED MATERIAL AND REMOVE WITH INERT ABSORBENT AND NON-SPARKING TOOLS. STORE IN CLOSED CONTAINER UNTIL PROPERLY DISPOSED OF.

WASTE DISPOSAL METHOD INCINERATE UNDER SAFE CONDITIONS OR DISPOSE OF IN ACCORDANCE WITH LOCAL, STATE AND FEDERAL REGULATIONS.

CERCLA (SUPERFUND) REPORTABLE QUANTITY (IN LBS) ONE POUND OR REFER TO SECTION 311 CLEAN WATER ACT.

RCRA HAZARDOUS WASTE NO. (40 CFR 261.33) D-001, F-003 NOTE: NUMBERS APPLY TO THINNER BLEND ONLY.

VOLATILE ORGANIC COMPOUND (VOC) (AS PACKAGED, MINUS WATER) 100%

XX THEORETICAL 6.918 LB/GAL XX ANALYTICAL 6.882 LB/GAL

SECTION VIII - SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION (SPECIFY TYPE) USE NIOSH/MSHA APPROVED SELF CONTAINED BREATHING APPARATUS FOR CONCENTRATIONS ABOVE TLV LIMITS.

VENTILATION USE ONLY WITH ADEQUATE VENTILATION. USE EITHER LOCAL EXHAUST OR MECHANICAL TO MEET TLV REQUIREMENTS. VENTILATION MUST BE SUFFICIENT TO LIMIT EMPLOYEE EXPOSURE AT, OR BELOW, OSHA TLV LIMIT. HEAVY SOLVENT VAPORS SHOULD BE REMOVED FROM LOWER LEVELS OF WORK AREA.

PROTECTIVE GLOVES NEOPRENE OR EQUIVALENT.

EYE PROTECTION SAFETY GLASSES OR GOGGLES.

OTHER PROTECTIVE EQUIPMENT EYE BATH AND SAFETY SHOWER.

SECTION IX - SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORING KEEP AWAY FROM HEAT, SPARKS, OPEN FLAME. USE WITH ADEQUATE VENTILATION. DO NOT BREATHE VAPORS, DO NOT GET IN EYES, ON SKIN OR CLOTHING. DO NOT STORE ABOVE 120°F.

OTHER PRECAUTIONS NEVER USE CUTTING OR WELDING TORCH IN, ON OR NEAR CONTAINERS, EVEN EMPTY, AS PRODUCT OR RESIDUE MAY IGNITE. DO NOT TRANSFER CONTENTS TO BOTTLES OR OTHER UNLABELED CONTAINERS.

SECTION VIII-SPECIAL PRECAUTIONS

Handling and Storing

- Wear neoprene gloves and protective clothing if direct contact likely; wear eye protection.
- Avoid skin and eye contact. Avoid breathing vapors.
- Treat as flammable material. Keep away from heat, sparks, and open flames.
- Avoid static electricity - ground containers when transferring product.
- Relieve possible internal pressure in container before opening by partially unscrewing bung.
- Vapors are heavier than air and will settle and collect in low areas and pits, displacing breathing air. Provide adequate ventilation to protect from these hazards and to keep below maximum exposure values.
- Empty containers retain hazardous product residues, both liquid and vapor.
- Keep container closed when not in use.

"The data included herein are presented according to W. R. Grace & Co.'s practices current at the time of preparation hereof, are made available solely for the consideration, investigation and verification of the original recipients hereof and do not constitute a representation or warranty for which Grace assumes legal responsibility. It is the responsibility of a recipient of this data to remain currently informed on chemical hazard information, to design and update its own program and to comply with all national, federal, state and local laws and regulations applicable to safety, including the [illegible] and environmental protection."

LEXINGTON, MA 02173

EMERGENCY PHONE NO. (617) 861-6600

SECTION I - IDENTIFICATION

PRODUCT (TRADE) NAME: DOREX DISP CONC 1106 (36-37)

General Chemical Description: Solvent-based sealant

SECTION II-INGREDIENTS

Hazardous Ingredients	% by Weight	Maximum Exposure Value (ppm) (8 hour time-weighted average) OSHA PEL*	ACGIH TLV**
n-hexane	43 approx.	50	50
other hexanes	16 approx.	500 (1000 STEL)	500 (1000 STEL)
cyclohexane (CAS#110-82-7) (SARA Section 313 chemical)	below 2	300	300
ethyl alcohol	below 2	1000	1000
isopropyl alcohol	below 1	400 (500 STEL)	400 (500 STEL)

* 29 CFR Section 1910.1000, July 1, 1988
** 1988-1989 recommendation, American Conference of Governmental Industrial Hygienists

Other Ingredients	% by Weight
Rubber, resin, filler, pigment, and modifiers (including water).	above 36

SECTION III-PHYSICAL DATA

Vapor density of n-hexane (air=1): 3.0 Specific Gravity (water=1): 0.80

Solubility in water: not soluble Volatiles, including water (% by weight): below 64
Appearance and Odor: Gray liquid; petroleum solvent odor

SECTION IV-FIRE AND EXPLOSION HAZARD DATA

Flash Point: below 20°F (Pensky-Martens)
Flammable Limits (n-hexane): 1.1 - 7.5%
Extinguishing Media: Carbon dioxide, dry chemical, foam.

Fire-fighters should wear the usual protective gear, self-contained breathing apparatus.

Combustion will result in the release of the usual decomposition products including oxides of carbon.

SECTION V-REACTIVITY DATA

Product is stable; hazardous polymerization will not occur.
Incompatible with strong oxidizers.

The data included herein are presented according to W. R. Grace & Co.'s practices current at the time of preparation hereof, are made available solely for the consideration, investigation and verification of the original recipients hereof and do not constitute a representation or warranty for which Grace assumes legal responsibility. It is the responsibility of a recipient of this data to remain currently informed on chemical hazard information, to design and update its own program and to comply with all national, federal, state, and local laws and regulations applicable to safety, occupational health, right-to-know

SECTION VI-SPILL OR LEAK PROCEDURES

Handling Precautions: See Section VIII.

For small spills: Wipe up, or absorb with sand or other absorbent material. Collect waste in sealed containers.
For large spills: Dike area to prevent spreading. Shovel or pump to drum or salvage tank. Absorb residual material with sand, or other absorbent material.

Use only clean-up equipment approved for flammable materials and areas.
Dispose of as a flammable material in accordance with current local, state, and Federal regulations.

EPA Hazardous Waste Number is: D001

SECTION VII-HEALTH HAZARD DATA

Threshold Limit Values: See Section II.

	Signs & Symptoms of Acute Exposure	Emergency First Aid Procedures
Inhalation:	Vapors can produce headache, nausea, dizziness, disorientation, numbness in fingers and toes, and irritation of nose and throat.	Remove to fresh air.
Eyes:	Irritation upon direct contact.	Immediately flush eyes with water for at least 15 minutes; get medical attention.
Skin:	Irritation upon direct contact.	Wash affected area with water; if irritation occurs and persists, get medical attention. Remove contaminated clothing.
Ingestion:	Harmful if swallowed.	Dilute with water or milk; do not induce vomiting; get medical attention.

CHRONIC EFFECTS: Prolonged or repeated overexposure to the solvent system by inhalation can produce central nervous system depression and/or nerve damage. Prolonged or repeated overexposure by skin contact can produce dermatitis.

MEDICAL CONDITIONS AGGRAVATED BY OVEREXPOSURE: Preexisting nervous system disorders and skin diseases may be aggravated.

GET MEDICAL ATTENTION IF SYMPTOMS PERSIST

SECTION II-INGREDIENTS

Hazardous Ingredients	% by Weight	Maximum Exposure Value (ppm) (8 hour time-weighted average) OSHA PEL*	ACGIH TLV**
ammonia (CAS#7664-41-7) (SARA Section 313 chemical)	below 0.5	(35 STEL)	25 (35 STEL)

1.0 % Diantmos

* 29 CFR Section 1910.1000, July 1, 1988
** 1988-1989 recommendation, American Conference of Governmental Industrial Hygienists

Other Ingredients	% by Weight
Water, rubber, resin, filler, pigment, and modifiers.	above 99.5

SECTION III-PHYSICAL DATA

Solubility in Water: water dilutable Specific Gravity (water=1): 1.2 approx.

Volatiles, including water (% by weight): 38 approx.

Appearance and Odor: Gray liquid; odor of ammonia

SECTION IV-FIRE AND EXPLOSION HAZARD DATA

Flash Point: above 200°F (Cleveland Open Cup)
Extinguishing Media: Carbon dioxide, dry chemical, foam.

Combustion will result in the release of the usual decomposition products including oxides of carbon and nitrogen.

SECTION V-REACTIVITY DATA

Product is stable; hazardous polymerization will not occur.

"The data included herein are presented according to W. R. Grace & Co.'s practices current at the time of preparation hereof, are made available solely for the consideration, investigation and verification of the original recipients hereof and do not constitute a representation or warranty for which Grace assumes legal responsibility. It is the responsibility of a recipient of this data to remain currently informed on chemical hazard information, to design and update its own program and to comply with all national, federal, state and local laws and regulations and health, safety

SECTION VI-SPILL OR LEAK PROCEDURES

Handling Precautions: See Section VIII.

For small spills: Wipe up, or absorb with sand or other absorbent material. Collect waste in sealed containers.
For large spills: Dike area to prevent spreading. Shovel or pump to drum or salvage tank. Absorb residual material with sand, or other absorbent material.

Material is not a hazardous waste as defined in 40 CFR Sec. 261.3.

Dispose of all product wastes and water rinses in accordance with current local, state, and Federal regulations.

SECTION VII-HEALTH HAZARD DATA

Threshold Limit Values: See Section II.

	Signs & Symptoms of Acute Exposure	Emergency First Aid Procedures
Inhalation:	Ammonia vapors could produce irritation of nose and throat.	Remove to fresh air.
Eyes:	Irritation upon direct contact.	Immediately flush eyes with water for at least 15 minutes; get medical attention.
	Vapors can produce irritation.	Remove to fresh air; flush eyes with water.
Skin:	Possible irritation.	Wash affected area with water; if irritation occurs and persists, get medical attention. Remove contaminated clothing.
Ingestion:	Not known.	Dilute with water or milk; do not induce vomiting; get medical attention

CHRONIC EFFECTS: Prolonged overexposure to ammonia by inhalation can cause suffocation and pulmonary edema.

MEDICAL CONDITIONS AGGRAVATED BY OVEREXPOSURE: Preexisting respiratory and skin diseases may be aggravated.

GET MEDICAL ATTENTION IF SYMPTOMS PERSIST

The data included herein are presented according to W. R. Grace & Co.'s practices current at the time of preparation hereof, are made available solely for the consideration, investigation and verification of the original recipients hereof and do not constitute a representation or warranty for which Grace assumes legal responsibility. It is the responsibility of a recipient of this data to remain currently informed on chemical hazard information, to design and update its own program and to comply with all national, federal, state, and local laws and regulations applicable to safety, occupational health, right-to-know, and environmental protection.

SECTION VIII-SPECIAL PRECAUTIONS

Handling and Storing

- Wear neoprene gloves if direct contact likely; wear eye protection.
- Avoid breathing vapors.
- Keep from freezing.

"The data included herein are presented according to W. R. Grace & Co.'s practices current at the time of preparation hereof, are made available solely for the consideration, investigation and verification of the original recipients hereof and do not constitute a representation or warranty for which Grace assumes legal responsibility. Flash Point : 100 deg C
Method : TCC
Autoignition Temperature : 370 deg C
Explosive Limits in Air, % by Vol. :
LEL : 0.9
UEL : 8.0

FIRE AND EXPLOSION HAZARDS
Vapor forms explosive mixture with air. Hazardous gases produced in fi
are carbon monoxide.

EXTINGUISHING MEDIA
Water. Chemical Foam. Dry Chemical. CO2.

SPECIAL FIRE FIGHTING INSTRUCTIONS
Flood with water. Wear self-contained breathing apparatus. Wear full protective equipment (eye, body, respiratory).

****

HEALTH HAZARD INFORMATION

PRINCIPAL HEALTH HAZARDS

Inhalation LC50: 1 hr. >10.7 mg/l in rats
Skin absorption LD50: >2,250 mg/kg in rabbits
Oral LD50: 8,191 mg/kg in rats

DBE is an eye irritant in animal tests. DBE demonstrated no mutagenic activity when tested in bacterial cell cultures. DBE demonstrated no reproductive toxicity and was not uniquely toxic to the fetus in a developmental study. DBE produced mild nasal lesions in rats.

Anticipated human health effects of overexposure include eye irritation.

CARCINOGENICITY
NONE OF THE COMPONENT(S) OF THIS MATERIAL IS LISTED AS A CARCINOGEN BY NTP, IARC, OR OSHA.

EXPOSURE LIMITS
AEL (Du Pont) : 10mg/M3 (8 hr TWA)
TLV * (ACGIH) : None Established
PEL (OSHA) : None Established
* TLV is a registered trademark.

Methanol: AEL: 200ppm, 8hr TWA, skin; 100ppm, 12hr TWA, skin
Hydrogen Cyanide: TLV*: C 10ppm, skin

SAFETY PRECAUTIONS
Avoid breathing vapors or mist. Avoid contact with eyes. Wash thoroughly after handling.

FIRST AID

INHALATION :
If inhaled, remove to fresh air. If not breathing, give artificial respiration, preferably mouth-to-mouth. If breathing is difficult, give oxygen. Call a physician.

SKIN CONTACT :
Flush skin with water.

EYE CONTACT :
In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Call a physician.

INGESTION :
If swallowed, do not induce vomiting. Give large quantities of water. Never give anything by mouth to an unconscious person. Call a physician.

****
PROTECTION INFORMATION

GENERALLY APPLICABLE CONTROL MEASURES and PRECAUTIONS
Use only with adequate ventilation. Do not mix with strong oxidants, acids, alkalies. Do not consume food, drink or tobacco in areas where they may become contaminated with this material.

PERSONAL PROTECTIVE EQUIPMENT
Coverall chemical splash goggles. Use when splash is likely. Air supplied respirator. Chemical Cartridge Respirator : Half-mask organic vapor cartridge. Full-face organic vapor cartridge if eye protection needed. Impervious gloves such as Neoprene.

****
AQUATIC TOXICITY : 96 hr, fathead minnows, LC50: >18ppm <24ppm

SPILL, LEAK, OR RELEASE
Review FIRE AND EXPLOSION HAZARDS and SAFETY PRECAUTIONS before proceeding with clean up. Use appropriate PERSONAL PROTECTIVE EQUIPMENT during clean up.

Remove source of heat, sparks, flame, impact, friction or electricity. Dike spill. Prevent liquid from entering sewers, water ways or low areas. Recover free liquid for reuse or reclamation. Recover undamaged and minimally contaminated material for reuse or reclamation. Soak up with sawdust, sand, oil dry or other absorbent material.

WASTE DISPOSAL
Treatment, storage, transportation and disposal must be in accordance with EPA or State regulations under the authority of the Resource

DISPOSAL INFORMATION - CONTINUED

Conservation and Recovery Act (40 CFR, parts 260-271). Recover nonusable free liquid and dispose of in an approved and permitted incinerator. Recover contaminated water and dispose of in an approved and permitted biological treatment system or an approved and permitted deepwell. Remove nonusable solid material and/or contaminated soil, for disposal in an approved and permitted landfill. Do not flush to surface water or sanitary sewer system.

****

SHIPPING INFORMATION

DOMESTIC OTHER THAN AIR (DOT)
Shipping Name : DIBASIC ESTER MIXTURE
Hazard Class : Not Regulated
Freight Class : Plasticizers + Solvents

INTERNATIONAL WATER OR AIR (IMO/ICAO)
Shipping Name : DIBASIC ESTER MIXTURE
Hazard Class : Not Regulated

BULK WATER (USCG)
Shipping Name : DIBASIC ESTER MIXTURE

OTHER SHIPPING INFORMATION
Shipping Containers :
Tank Car : 170,000 lbs
Tank Truck : 42,000 lbs
Steel Drums : 485 lbs

****

STORAGE CONDITIONS

Store in well ventilated area. Keep container tightly closed. Do not store with strong oxidants, acids, alkalies.

****

ADDITIONAL INFORMATION AND REFERENCES

As DBE's may contain traces of methanol and hydrogen cyanide avoid concentrating these contaminants to a hazardous level during processing.

EMERGENCY PHONE NO. (617) 861-6600

SECTION I - IDENTIFICATION

PRODUCT (TRADE) NAME: DAREX MIST SOLN 72S

General Chemical Description: Solvent-based coating

SECTION II-INGREDIENTS

Hazardous Ingredients	% by Weight	Maximum Exposure Value (ppm) (8 hour time-weighted average) OSHA PEL*	ACGIH TLV**
oil (mist), mineral (CAS#8012-95-1)	5 approx.	5 mg/M3	5 mg/M3 (10 mg/M3 STEL)
mixed isomeric heptanes	95 approx.	not listed (500 recommended by supplier; 400 listed by OSHA for n-heptane)	not listed (400 listed for n-heptane)

* 29 CFR Section 1910.1000, July 1, 1988
** 1988-1989 recommendation, American Conference of Governmental Industrial Hygienists

Other Ingredients	% by Weight
none	0

SECTION III-PHYSICAL DATA

Vapor density of heptane (air=1): 3.5 approx. Specific Gravity (water=1): 0.7 approx.

Solubility in water: not soluble Volatiles, including water (% by weight): 95 approx.
Appearance and Odor: Water-white liquid; petroleum solvent odor

SECTION IV-FIRE AND EXPLOSION HAZARD DATA

Flash Point: below 20°F (Pensky-Martens)
Flammable Limits (solvent): 1.0 - 6.0%
Extinguishing Media: Carbon dioxide, dry chemical, foam.

Fire-fighters should wear the usual protective gear, self-contained breathing apparatus.

Combustion will result in the release of the usual decomposition products including oxides of carbon.

SECTION V-REACTIVITY DATA

Product is stable; hazardous polymerization will not occur.
Incompatible with strong oxidizers.

"The data included herein are presented according to W. R. Grace & Co.'s practices current at the time of preparation hereof, are made available solely for the consideration, investigation and verification of the original recipients hereof and do not constitute a representation or warranty for which Grace assumes legal responsibility. It is the responsibility of a recipient of this data to remain currently informed on chemical hazard information, to design and update its own program and to comply with all national, federal, state, and local laws and regulations applicable to safety, occupational health, right-to-know and environmental protection."

SECTION VI-SPILL OR LEAK PROCEDURES

Handling Precautions: See Section VIII.

For small spills: Wipe up, or absorb with sand or other absorbent material. Collect waste in sealed containers.
For large spills: Dike area to prevent spreading. Shovel or pump to drum or salvage tank. Absorb residual material with sand, or other absorbent material.

Use only clean-up equipment approved for flammable materials and areas.
Dispose of as a flammable material in accordance with current local, state, and Federal regulations.

EPA Hazardous Waste Number is: D001

SECTION VII-HEALTH HAZARD DATA

Threshold Limit Values: See Section II.

	Signs & Symptoms of Acute Exposure	Emergency First Aid Procedures
Inhalation:	Vapors can produce headache, nausea, dizziness, disorientation, and irritation of nose and throat.	Remove to fresh air.
Eyes:	Irritation upon direct contact.	Immediately flush eyes with water for at least 15 minutes; get medical attention.
Skin:	Irritation upon direct contact.	Wash affected area with water; if irritation occurs and persists, get medical attention. Remove contaminated clothing.
Ingestion:	Harmful if swallowed.	Dilute with water or milk; do not induce vomiting; get medical attention.

CHRONIC EFFECTS: Prolonged or repeated overexposure to heptanes by skin contact can produce dermatitis.

MEDICAL CONDITIONS AGGRAVATED BY OVEREXPOSURE: Preexisting skin diseases may be aggravated.

GET MEDICAL ATTENTION IF SYMPTOMS PERSIST

"The data included herein are presented according to W. R. Grace & Co.'s practices current at the time of preparation hereof, are made available solely for the consideration, investigation and verification of the original recipients hereof and do not constitute a representation or warranty for which Grace assumes legal responsibility. MSDS

Section V—HEALTH HAZARD DATA

THRESHOLD LIMIT VALUE: SEE SECTION II

EFFECTS OF OVEREXPOSURE: ACUTE

EYES - Can cause severe irritation, tearing, blurred vision.

SKIN - Prolonged or repeated contact can cause moderate irritation, drying, defatting, dermatitis.

INHALATION - Excessive inhalation of vapors can cause nasal and respiratory irritation, dizziness, weakness, fatigue, nausea, headache, possible unconsciousness and asphyxiation.

INGESTION - Can cause gastrointestinal irritation, nausea, vomiting and diarrhea. Aspiration of material into lungs can cause chemical pneumonitis which can be fatal.

EFFECTS OF OVEREXPOSURE: CHRONIC

Prolonged or repeated contact with skin may cause dermatitis.
Prolonged or repeated overexposure may cause anemia and kidney damage.
Reports have associated repeated and prolonged occupational overexposure to solvents with permanent brain and nervous system damage.

AGGRAVATED MEDICAL CONDITIONS

Pre-existing skin and respiratory disorders may be aggravated by exposure.

PRIMARY ROUTES OF ENTRY

Inhalation and skin contact.

EMERGENCY AND FIRST AID PROCEDURES: In case of skin contact, wash thoroughly with soap and water: for eyes, flush immediately with plenty of water for 15 minutes and call a physician. Remove and wash contaminated clothing before reuse. If exposed to high concentration of vapor remove patient to fresh air. If swallowed, CALL A PHYSICIAN IMMEDIATELY. DO NOT INDUCE VOMITING.

Section VI—REACTIVITY DATA

STABILITY: [ ] UNSTABLE [X] STABLE

INCOMPATIBILITY (Materials to avoid): Strong oxidizing agents.

HAZARDOUS DECOMPOSITION PRODUCTS: As with any organic chemical, thermal decomposition will yield carbon dioxide and probably carbon monoxide.

HAZARDOUS POLYMERIZATION [ ] MAY OCCUR [X] WILL NOT OCCUR

CONDITIONS TO AVOID: Sources of ignition, high temperatures.

Section VII—SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED: Remove sources of ignition, ventilate and remove with inert absorbent.

WASTE DISPOSAL METHOD: Incinerate in approved facility in accordance with local, state and federal regulations. Do not incinerate closed container.

Section VIII—SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION: NIOSH approved respiratory device may be used. But, under normally well ventilated conditions no respiratory problems may be expected.

VENTILATION: All application areas should be ventilated in accordance with OSHA regulations.

PROTECTIVE GLOVES: Recommended.

EYE PROTECTION: Use approved safety eyewear with splash guards.

OTHER PROTECTIVE EQUIPMENT: Safety shower and eye bath.

Section IX—SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORING: Keep away from heat, sparks and open flame. Use only with adequate ventilation. Since emptied containers retain product residue (vapor or liquid), all labeled hazard precautions must be observed.

OTHER PRECAUTIONS: Avoid prolonged or repeated breathing of vapor or spray mist. Avoid contact with eyes and skin. Do not take internally.

The information contained herein is furnished without warranty of any kind. Employers should use this information only as a supplement to other information gathered by them and must make independent determinations of suitability and completeness of information from all sources to assure proper use of these materials and the safety and health of employees.

THRESHOLD LIMIT VALUE 400 ppm (ACGIH)	OTHER LIMIT 400 ppm (OSHA)
PERMISSIBLE EXPOSURE LIMIT 400 ppm	400 ppm (Vendor)

EFFECTS OF OVEREXPOSURE - (Conditions to Avoid) Inhalation - Irritation of the respiratory tract; headache, nausea, dizziness, weakness and fatigue. Extreme exposure can result in unconsciousness and even respiratory arrest. Eye Contact - Severe irritant. Skin Contact - Prolonged and repeated liquid contact can cause defatting and drying of skin, which may result in skin irritation and dermatitis. CHRONIC: Reports have associated repeated and prolonged occupational overexposure to solvents with permanent brain and nervous system damage. Intentional misuse by deliberately concentrating and inhaling the contents may be harmful or fatal.

PRIMARY ROUTES OF ENTRY Inhalation, skin contact, swallowing

breathing becomes difficult, administer oxygen. If breathing ceases, restore using approved CPR techniques and summon medical assistance immediately. Eye Contact - Flush immediately with large amounts of water for at least 15 minutes. Consult a physician for medical treatment. Skin Contact - Wash affected areas with soap and water. Remove soiled clothing. Consult a physician if irritation persists. Ingestion - INDUCE VOMITING. Contact a physician immediately.

NOTICE: Intentional misuse by deliberately concentrating and inhaling the contents may be harmful or fatal.

SECTION VI - REACTIVITY DATA

STABILITY	UNSTABLE	CONDITIONS TO AVOID	Heat, sparks, open flame.
	STABLE XX		

INCOMPATIBILITY (materials to avoid) Strong oxidizing agents.

HAZARDOUS DECOMPOSITION PRODUCTS Thermal decomposition may yield carbon monoxide and carbon dioxide.

HAZARDOUS POLYMERIZATION	MAY OCCUR	CONDITIONS TO AVOID
	WILL NOT OCCUR XX	

SECTION VII - SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED Remove all sources of ignition (flames, hot surfaces, and electrical static or frictional sparks). Avoid breathing vapors. Ventilate area. Wear appropriate respirator and protective clothing. Dike and contain spilled material and remove with inert absorbent and non-sparking tools. Store in closed container until properly disposed of.

WASTE DISPOSAL METHOD Incinerate under safe conditions or dispose of in accordance with local, state and federal regulations.

CERCLA (Superfund) REPORTABLE QUANTITY (in lbs) One pound or refer to Section 311 Clean Water Act.

RCRA Hazardous Waste No. (40 CFR 261.33) D-001 Note: Number applies to thinner blend only.

VOLATILE ORGANIC COMPOUND (VOC) (as packaged, minus water) 100%

X Theoretical 6.505 lb/gal XX Analytical 6.505 lb/gal

RESPIRATORY PROTECTION (specify type) Use NIOSH/MSHA approved self contained breathing apparatus.

VENTILATION Use either local exhaust or mechanical to meet TLV requirements. Ventilation must be sufficient to limit employee exposure at, or below, OSHA TLV limit.

PROTECTIVE GLOVES Neoprene or equivalent.

EYE PROTECTION Safety glasses or goggles.

OTHER PROTECTIVE EQUIPMENT Eye bath and safety shower.

SECTION IX - SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORING Keep away from heat, sparks, open flame. Use with adequate ventilation. Do not breathe vapors, do not get in eyes, on skin or clothing.

OTHER PRECAUTIONS Never use cutting or welding torch in, on or near containers, even empty, as product or residue may ignite.

PRODUCT: 2518000
INVOICE: 944302
INVOICE DATE: 04/03/86
TO: CAMPBELL SOUP CO.
2550 WEST 35TH ST.
CHICAGO IL 60632

ATTN: PLANT MGR./SAFETY DIR.

SECTION I-PRODUCT IDENTIFICATION

GENERAL OR GENERIC ID: ALIPHATIC HYDROCARBON

DOT HAZARD CLASSIFICATION: COMBUSTIBLE (173.115)

SECTION II-COMPONENTS

INGREDIENT	% (BY WT)	PEL	TLV	NOTE
ALIPHATIC PETROLEUM DISTILLATES	>95	500	100 PPM	(1)

(1): NIOSH RECOMMENDS A LIMIT OF 350 MG/CUM - 8 HOUR TIME WEIGHTED AVERAGE, 1800 MG/CUM AS DETERMINED BY A 15 MINUTE SAMPLE.

SECTION III-PHYSICAL DATA

PROPERTY	REFINEMENT	MEASUREMENT
BOILING POINT	FOR PRODUCT	300.00 DEG F (148.88 DEG C)
VAPOR PRESSURE	FOR PRODUCT	@ 760.00 MMHG
SPECIFIC VAPOR DENSITY	AIR = 1	2.00 MMHG @ 68.00 DEG F (20.00 DEG C)
SPECIFIC GRAVITY		4.9
PERCENT VOLATILES		.770 @ 60.00 DEG F (15.55 DEG C)
EVAPORATION RATE	(ETHER = 1)	100.00%
		70.00

SECTION IV-FIRE AND EXPLOSION INFORMATION

FLASH POINT (100.00 DEG F 37.77 DEG C)

EXPLOSIVE LIMIT (PRODUCT) LOWER - 1.0%

EXTINGUISHING MEDIA: REGULAR FOAM OR CARBON DIOXIDE OR DRY CHEMICAL

HAZARDOUS DECOMPOSITION PRODUCTS: MAY FORM TOXIC MATERIALS:, CARBON DIOXIDE AND CARBON MONOXIDE, VARIOUS HYDROCARBONS, ETC.

FIREFIGHTING PROCEDURES: WEAR SELF-CONTAINED BREATHING APPARATUS WITH A FULL FACEPIECE OPERATED IN PRESSURE-DEMAND OR OTHER POSITIVE PRESSURE MODE WHEN FIGHTING FIRES.

SPECIAL FIRE & EXPLOSION HAZARDS: VAPORS ARE HEAVIER THAN AIR AND MAY TRAVEL ALONG THE GROUND OR BE MOVED BY VENTILATION AND IGNITED BY HEAT, PILOT LIGHTS, OTHER FLAMES AND IGNITION SOURCES AT LOCATIONS DISTANT FROM MATERIAL HANDLING POINT.

NEVER USE WELDING OR CUTTING TORCH ON OR NEAR DRUM (EVEN EMPTY) BECAUSE PRODUCT (EVEN JUST RESIDUE) CAN IGNITE EXPLOSIVELY.

NFPA CODES: HEALTH- 0 FLAMMABILITY- 2 REACTIVITY- 0

SECTION V-HEALTH HAZARD DATA

PERMISSIBLE EXPOSURE LEVEL	500	PPM
THRESHOLD LIMIT VALUE	100	PPM

EFFECTS OF ACUTE OVEREXPOSURE: FOR PRODUCT

EYES - CAN CAUSE SEVERE IRRITATION, REDNESS, TEARING, BLURRED VISION.
SKIN - PROLONGED OR REPEATED CONTACT CAN CAUSE MODERATE IRRITATION, DEFATTING, DERMATITIS.
BREATHING - EXCESSIVE INHALATION OF VAPORS CAN CAUSE NASAL AND RESPIRATORY IRRITATION, DIZZINESS, WEAKNESS, FATIGUE, NAUSEA, HEADACHE, POSSIBLE UNCONSCIOUSNESS, AND EVEN ASPHYXIATION.
SWALLOWING - CAN CAUSE GASTROINTESTINAL IRRITATION, NAUSEA, VOMITING, AND DIARRHEA. ASPIRATION OF MATERIAL INTO THE LUNGS CAN CAUSE CHEMICAL PNEUMONITIS WHICH CAN BE FATAL.

COPYRIGHT 1986

CONTINUED ON PAGE: 2

SECTION V-HEALTH HAZARD DATA (CONTINUED)

FIRST AID:

IF ON SKIN: THOROUGHLY WASH EXPOSED AREA WITH SOAP AND WATER. REMOVE CONTAMINATED CLOTHING. LAUNDER CONTAMINATED CLOTHING BEFORE RE-USE.

IF IN EYES: FLUSH WITH LARGE AMOUNTS OF WATER, LIFTING UPPER AND LOWER LIDS OCCASIONALLY, GET MEDICAL ATTENTION.

IF SWALLOWED: DO NOT INDUCE VOMITING, KEEP PERSON WARM, QUIET, AND GET MEDICAL ATTENTION. ASPIRATION OF MATERIAL INTO THE LUNGS DUE TO VOMITING CAN CAUSE CHEMICAL PNEUMONITIS WHICH CAN BE FATAL.

IF BREATHED: IF AFFECTED, REMOVE INDIVIDUAL TO FRESH AIR. IF BREATHING IS DIFFICULT, ADMINISTER OXYGEN. IF BREATHING HAS STOPPED GIVE ARTIFICIAL RESPIRATION. KEEP PERSON WARM, QUIET AND GET MEDICAL ATTENTION.

PRIMARY ROUTE(S) OF ENTRY:

INHALATION

SKIN CONTACT

SECTION VI-REACTIVITY DATA

HAZARDOUS POLYMERIZATION: CANNOT OCCUR

STABILITY: STABLE

INCOMPATIBILITY: AVOID CONTACT WITH:, STRONG OXIDIZING AGENTS.

SECTION VII-SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED:

SMALL SPILL: ABSORB LIQUID ON PAPER, VERMICULITE, FLOOR ABSORBENT, OR OTHER ABSORBENT MATERIAL AND TRANSFER TO HOOD.

LARGE SPILL: ELIMINATE ALL IGNITION SOURCES (FLARES, FLAMES INCLUDING PILOT LIGHTS, ELECTRICAL SPARKS). PERSONS NOT WEARING PROTECTIVE EQUIPMENT SHOULD BE EXCLUDED FROM AREA OF SPILL UNTIL CLEAN-UP HAS BEEN COMPLETED. STOP SPILL AT SOURCE, DIKE AREA OF SPILL TO PREVENT SPREADING, PUMP LIQUID TO SALVAGE TANK. REMAINING LIQUID MAY BE TAKEN UP ON SAND, CLAY, EARTH, FLOOR ABSORBENT, OR OTHER ABSORBENT MATERIAL AND SHOVELED INTO CONTAINERS. PREVENT RUN-OFF TO SEWERS, STREAMS OR OTHER BODIES OF WATER. IF RUN-OFF OCCURS, NOTIFY PROPER AUTHORITIES AS REQUIRED, THAT A SPILL HAS OCCURED.

WASTE DISPOSAL METHOD:

SMALL SPILL: ALLOW VOLATILE PORTION TO EVAPORATE IN HOOD. ALLOW SUFFICIENT TIME FOR VAPORS TO COMPLETELY CLEAR HOOD DUCT WORK. DISPOSE OF REMAINING MATERIAL IN ACCORDANCE WITH APPLICABLE REGULATIONS.

LARGE SPILL: DESTROY BY LIQUID INCINERATION. CONTAMINATED ABSORBENT MAY BE DEPOSITED IN A LANDFILL IN ACCORDANCE WITH LOCAL, STATE AND FEDERAL REGULATIONS.

SECTION VIII-PROTECTIVE EQUIPMENT TO BE USED

RESPIRATORY PROTECTION: IF TLV OF THE PRODUCT OR ANY COMPONENT IS EXCEEDED, A NIOSH/MSHA JOINTLY APPROVED AIR SUPPLIED RESPIRATOR IS ADVISED IN ABSENCE OF PROPER ENVIRONMENTAL CONTROL. OSHA REGULATIONS ALSO PERMIT OTHER NIOSH/MSHA RESPIRATORS UNDER SPECIFIED CONDITIONS. (SEE YOUR SAFETY EQUIPMENT SUPPLIER). ENGINEERING OR ADMINISTRATIVE CONTROLS SHOULD BE IMPLEMENTED TO REDUCE EXPOSURE.

VENTILATION: PROVIDE SUFFICIENT MECHANICAL (GENERAL AND/OR LOCAL EXHAUST) VENTILATION TO MAINTAIN EXPOSURE BELOW TLV(S).

PROTECTIVE GLOVES: WEAR RESISTANT GLOVES SUCH AS:, NITRILE RUBBER

EYE PROTECTION: CHEMICAL SPLASH GOGGLES IN COMPLIANCE WITH OSHA REGULATIONS ARE ADVISED; HOWEVER, OSHA REGULATIONS ALSO PERMIT OTHER TYPE SAFETY GLASSES. (CONSULT YOUR SAFETY EQUIPMENT SUPPLIER)

OTHER PROTECTIVE EQUIPMENT: TO PREVENT REPEATED OR PROLONGED SKIN CONTACT, WEAR IMPERVIOUS CLOTHING AND BOOTS.

SECTION IX-SPECIAL PRECAUTIONS OR OTHER COMMENTS

CONTAINERS OF THIS MATERIAL MAY BE HAZARDOUS WHEN EMPTIED. SINCE EMPTIED CONTAINERS RETAIN PRODUCT RESIDUES (VAPOR, LIQUID, AND/OR SOLID), ALL HAZARD PRECAUTIONS GIVEN IN THE DATA SHEET MUST BE OBSERVED.

THE INFORMATION ACCUMULATED HEREIN IS BELIEVED TO BE ACCURATE BUT IS NOT WARRANTED TO BE WHETHER ORIGINATING WITH THE COMPANY OR NOT. RECIPIENTS ARE ADVISED TO CONFIRM IN ADVANCE OF NEED THAT THE INFORMATION IS CURRENT, APPLICABLE, AND SUITABLE TO THEIR CIRCUMSTANCES.

COMBUSTIBLE (FLASH POINT 100 TO 200F)

EXTINGUISHING-MEDIA ----------
WATER SPRAY. REGULAR FOAM. DRY CHEMICAL. CARBON DIOXIDE.

SPECIAL FIRE FIGHTING INSTRUCTIONS ----------

CODE R00000010701

SUN MINERAL SPIRITS

COOL TANK/ CONTAINER. WEAR SELF-CONTAINED BREATHING APPARATUS. WEAR STRUCTURAL FIREFIGHTERS PROTECTIVE CLOTHING.

NFPA/HMIS CLASSIFICATION
HEALTH - 1 / 1
FIRE - 2 / 2
REACTIVITY - 0 / 0
PERSONAL PROTECTION INDEX - X

HAZARD RATING
0=LEAST 1=SLIGHT
2=MODERATE 3=HIGH
4=EXTREME

SPECIFIC HAZARD: COMBUSTIBLE LIQUID

6. ACCIDENTAL RELEASE MEASURES

PREVENT IGNITION; STOP LEAK; VENTILATE AREA. CONTAIN SPILL. WEAR RESPIRATORY PROTECTION FOR LARGE SPILL, LEAK OR RELEASE. USE PERSONAL PROTECTIVE EQUIPMENT STATED IN SECTION 8. ADVISE EPA; STATE AGENCY IF REQUIRED. ABSORB ON INERT MATERIAL. SHOVEL, SWEEP OR VACUUM SPILL.

7. HANDLING AND STORAGE

KEEP AWAY FROM HEAT, SPARKS AND FLAME. KEEP CONTAINER TIGHTLY CLOSED. NFPA CLASS II STORAGE. TRANSFER OPERATIONS MUST BE ELECTRICALLY GROUNDED TO DISSIPATE STATIC BUILDUP. WASH THOROUGHLY AFTER HANDLING. NEVER SIPHON BY MOUTH.

8. EXPOSURE CONTROL / PERSONAL PROTECTION

CONSULT WITH A HEALTH/SAFETY PROFESSIONAL FOR SPECIFIC SELECTION.

VENTILATION ----------
USE ONLY WITH ADEQUATE VENTILATION. VENTILATE AS NEEDED TO COMPLY WITH EXPOSURE LIMIT.

PERSONAL PROTECTIVE EQUIPMENT ----------
EYE ----------
SPLASH PROOF CHEMICAL GOGGLES OR FULL FACE SHIELD RECOMMENDED TO PROTECT AGAINST SPLASH OF PRODUCT.
GLOVES ----------
PROTECTIVE GLOVES RECOMMENDED WHEN PROLONGED SKIN CONTACT CANNOT BE AVOIDED. THE FOLLOWING GLOVE MATERIALS ARE ACCEPTABLE: POLYETHYLENE; NEOPRENE; NITRILE; POLYVINYL ALCOHOL; VITON;
RESPIRATOR ----------
CONCENTRATION-IN-AIR DETERMINES PROTECTION NEEDED. USE ONLY NIOSH CERTIFIED RESPIRATORY PROTECTION. HALF-MASK AIR PURIFYING RESPIRATOR WITH ORGANIC VAPOR CARTRIDGES IS ACCEPTABLE TO 10 TIMES THE EXPOSURE LIMIT. FULL-FACE AIR PURIFYING RESPIRATOR WITH ORGANIC VAPOR CARTRIDGES IS ACCEPTABLE TO 50 TIMES THE EXPOSURE LIMIT NOT TO EXCEED THE CARTRIDGE LIMIT OF 1000 PPM. PROTECTION BY AIR PURIFYING RESPIRATORS IS LIMITED. USE A POSITIVE PRESSURE-DEMAND FULL-FACE SUPPLIED AIR RESPIRATOR OR SCBA FOR EXPOSURES ABOVE 50X THE EXPOSURE LIMIT. IF EXPOSURE IS ABOVE IDLH(IMMEDIATELY DANGEROUS TO LIFE & HEALTH) OR THERE IS THE POSSIBILITY OF AN UNCONTROLLED RELEASE OR EXPOSURE LEVELS ARE UNKNOWN THEN USE A POSITIVE PRESSURE-DEMAND FULL-FACE SUPPLIED AIR RESPIRATOR WITH ESCAPE BOTTLE OR SCBA.

OTHER ----------

IF CONTACT IS UNAVOIDABLE, WEAR CHEMICAL RESISTANT CLOTHING. THE FOLLOWING MATERIALS ARE ACCEPTABLE AS PROTECTIVE CLOTHING MATERIALS: POLYVINYL ALCOHOL(PVA); NEOPRENE; NITRILE; VITON; POLYURETHANE; SAFETY SHOWER AND EYE WASH AVAILABILITY RECOMMENDED. LAUNDER SOILED CLOTHES. FOR NON-FIRE EMERGENCIES, POSITIVE PRESSURE SELF-CONTAINED BREATHING APPARATUS (SCBA) & STRUCTURAL FIREFIGHTERS' PROTECTIVE CLOTHING WILL PROVIDE LIMITED PROTECTION.

Campbell's Soup

Campbell Soup Company

NAPOLEON, OHIO 43545

RECEIVED
MAY 27 1999
OHIO E.P.A.
N.W.D.O.

May 26, 1999

Mr. Mike Terpinski
Northwest District Office Ohio E.P.A.
347 N. Dunbridge Road
Bowling Green, OH 43402

SUBJECT: Campbell Name Change

Dear Mr. Terpinski:

Campbell Soup Company is implementing a new business structure that will be comprised of three companies: *Campbell Soup Company, Campbell Sales Company, and Campbell Soup Supply Company.*

Campbell Soup Supply Company will be a wholly owned subsidiary of Campbell Soup Company. Effective August 2, 1999 *Campbell Soup Supply Company* will operate most of the U.S. manufacturing facilities, including the Napoleon plant.

Therefore, we request that the existing Campbell Soup Hazardous Waste Generator ID's OHD005419171 and OHD987046703 be reassigned or transferred to the new *Campbell Soup Supply Company*, Napoleon plant, effective August 2, 1999.

Please contact me at 419-592-1010 if you have any questions.

Sincerely,

CAMPBELL SOUP COMPANY

CERTIFIED MAIL

Re: Campbell Soup Company
Napoleon, OH Facility
Request for Information

Dear Ms. Carter:

This is a request for information by the Ohio Environmental Protection Agency's (Ohio EPA) Division of Hazardous Waste Management (DHWM) regarding the waste management practices of the Campbell Soup Company Facility ("Campbell") located at 641 Heller Drive, Napoleon, Ohio, 43832, and the disposal facility known as the "Imthurn Drum Site ("Imthurn"), located at 585 The Bend Road, Ney, Ohio 43549. Ohio EPA is seeking information regarding Campbell and Imthurn pursuant to its authority under Ohio Revised Code (ORC) Sections 3734.20 and 6111.05.

The Agency has determined that conditions at Imthurn, a solid waste facility, hazardous waste facility and/or other location where hazardous waste has been treated, stored, or disposed, constitute a substantial threat to public health or safety, or are causing or contributing to or threatening to cause or contribute to air or water pollution or soil contamination. Ohio EPA's DHWM requests that Campbell provide the following information. If copies of any report or information requested have previously been submitted to Ohio EPA, rather than resubmit duplicate documents, please identify the individual and location to which they were submitted.

1. Please identify all persons, by name, address and telephone number, who were consulted in the preparation of the answers to these questions.

2. Please identify all documents consulted, examined or referred to in the preparation of the answers to these questions.

3. Please state the full legal name, and date and location of incorporation, as applicable, for the following entity: Campbell Soup Company. (If this entity is a partnership, please describe the nature of the partnership, whether general or limited, and identify the names and

addresses of the partners.) Please identify the owner and operator of the Campbell facility in Napoleon, Ohio; if this facility is owned and/or operated by a division or wholly owned subsidiary of Campbell Soup Company, please identify such. Describe the legal relationship between all entities identified in response to this question.

4. Please specifically identify all waste materials and/or waste streams generated by Campbell between the years 1979 and the present. This includes, but is not limited to the following: solid waste (as defined in ORC § 3734.01), hazardous waste (as defined in ORC § 3734.01), and/or industrial or other waste (as defined in ORC § 6111.01). Please include, to the extent possible, information about volumes of wastes generated.

5. Please provide all available documentation of each waste material or waste stream identified in #4, above, including, but not limited to, Material Safety Data Sheets and waste analyses.

6. Please identify any material, produced as a by-product of, or incidental to, the Campbell manufacturing process which, from the years 1979 to the present, was sold by Campbell, or given at no charge by Campbell, to any person for any purpose other than waste disposal. Please identify such material by volume, and chemical constituents.

7. Please provide all available documentation of each material, waste material or waste stream identified in #6, above, including, but not limited to, Material Safety Data Sheets and waste analyses.

8. Please identify, by name, address, and telephone number, the individual(s) who received any material described in #6, above.

9. Please identify, for each waste material or waste stream described in response to questions above, the manner of disposal which was utilized by Campbell; if such manner of disposal included reuse and/or recycling, including burning for energy recovery, please so identify.

10. Please identify all off-site disposal, reuse, recycling and/or reclamation facilities to which Campbell transported, or caused to be transported, waste between the years 1979 to the present. For each such location, please identify, by name, address, and telephone number, the facility to which the waste transported, and a description of the waste material so transported.

11. Please provide all available documentation of the manner(s) of disposal described above, including, but not limited to, hazardous waste manifests, receipts, and/or invoices.

12. Please identify, by name, address, and telephone number, all waste transporters used by

Campbell from the years 1979 through the present.

13. Please provide a detailed description of all waste disposal, reuse, and/or recycling, including burning for energy recovery, which occurred on the Campbell facility between the years 1979 and the present. Please specifically identify areas on the Campbell facility where such waste disposal, reuse, and/or recycling, including burning for energy recovery, occurred.

14. Provide copies of all reports, sampling and analysis results for areas of the property owned by Campbell in Napoleon, OH, that have been subjected to sampling and analysis of soil, groundwater, surface water, effluent and/or sediment.

15. Please identify all persons, by name, address and telephone number, currently or formerly employed by Campbell having knowledge or information about the generation, transportation, treatment, disposal or other handling of waste material, including material described in your responses to #6 and #10, above.

16. If you have reason to believe that there may be persons able to provide a more detailed or complete response to any of the questions contained herein, or who may be able to provide additional responsive documents, please identify such persons by name, address and telephone number.

17. Please provide a certification statement as follows for all information submitted: "I certify under penalty of law that I have personally examined and am familiar with the information submitted in responding to this Information Request. Based on my review of all relevant documents and inquiry of those individuals immediately responsible for providing all relevant information and documents, I believe that the information submitted is true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."

The information must be provided notwithstanding its possible characterization as confidential information or trade secrets. You may request, however, that any such information be handled as a trade secret in accordance with the provisions of OAC Rules 3745-49-03 and 3745-50-30. A request for confidential treatment must be made when the information is submitted, since any information not so identified will not be accorded this protection by Ohio EPA. Please submit the information requested herein within forty-five (45) days of the date of this request to:

Frances M. Kovac
Ohio Environmental Protection Agency
Legal Office
Lazarus Government Center
122 South Front Street
P.O. Box 1049
Columbus, Ohio 43215-1049

Failure to provide the requested information may result in the exercise of the Ohio EPA's enforcement authority, including but not limited to, the exercise of its authority to inspect Campbell and any records in its possession which may pertain to the management and/or disposal of hazardous waste, hazardous constituents, industrial waste, or other waste. Please do not hesitate to contact me at (614) 644-2844, if you have any related questions or concerns. Thank you for your prompt attention to this request.

Sincerely,

Frances M. Kovac

Campbell SOUP Company

RECEIVED
JUL 25 1995
OHIO E.P.A.
N.W.D.O.

NAPOLEON, OHIO 43545

July 10, 1995

Mr. Gary Deutschman
Environmental Specialist
Ohio Environmental Protection Agency
Division of Hazardous Waste
Northwest District Office
347 N. Dunbridge Road
Bowling Green, OH 43402

Mr. Deutschman:

Enclosed you will find updated Regulated Waste Activity Notification forms for our main and V8 plants. Please feel free to call me at 419-599-6794 if you have any questions.

Sincerely,

Campbell SOUP Company

Jon Scott

Jon Scott
Environmental Engineer

Main Plant

Please print or type with ELITE type (12 char. s per inch) in the unshaded areas only

Form Approved, OMB No. 2050-0028 Expires 9-30-96
GSA No. 0246-EPA-OT

Please refer to the *Instructions for Filling Notification* before completing this form. The information requested here is required by law (Section 3010 of the *Resource Conservation and Recovery Act*).

EPA Notification of Regulated Waste Activity

United States Environmental Protection Agency

Date Received (For Official Use Only)

I. Installation's EPA ID Number *(Mark 'X' in the appropriate box)*

[ ] A. First Notification [X] B. Subsequent Notification *(Complete item C)*

C. Installation's EPA ID Number: OHD005419171

II. Name of Installation *(Include company and specific site name)*

CAMPBELL SOUP COMPANY

III. Location of Installation *(Physical address not P.O. Box or Route Number)*

Street: 12-773 STATE ROUTE 110

Street (Continued):

City or Town: NAPOLEON | State: OH | Zip Code: 43545-

County Code: | County Name: HENRY

IV. Installation Mailing Address *(See Instructions)*

Street or P.O. Box: SAME

City or Town: | State: | Zip Code: -

V. Installation Contact *(Person to be contacted regarding waste activities at site)*

Name *(Last)*: SCOTT | *(First)*: JON

Job Title: ENV. ENGINEER | Phone Number *(Area Code and Number)*: 419-599-6794

VI. Installation Contact Address *(See Instructions)*

A. Contract Address Location [X] Mailing [ ] Other [ ] | B. Street or P.O. Box:

City or Town: | State: | Zip Code: -

VII. Ownership *(See Instructions)*

A. Name of Installation's Legal Owner: CAMPBELL SOUP COMPANY

Street, P.O. Box, of Route Number: 12-773 STATE ROUTE 110

City or Town: NAPOLEON | State: OH | Zip Code: 43545-

Phone Number *(Area Code and Number)*: 419-592-1010 | B. Land Type: P | C. Owner Type: P | D. Change of Owner Indicator: Yes [ ] No [X] | (Date Changed) Month Day Year:

Continued on Reverse

Main Plant

Please print or type with ELITE type (haracters per inch) in the unshaded areas only

Form Approved, OMB No. 2050-0028 Expires 9-30-96
GSA No. 0246-EPA-OT

ID - For Official Use Only

VIII. Type of Regulated Waste Activity *(Mark 'X' in the appropriate boxes; Refer to Instructions)*

A. Hazardous Waste Activity

1. Generator (See Instructions)
   - ☐ a. Greater than 1000kg/mo (2,200 lbs.)
   - ☒ b. 100 to 1000 kg/mo (200-2,200 lbs.)
   - ☐ c. Less than 100 kg/mo (220 lbs)
2. Transporter (Indicate Mode in boxes 1-5 below)
   - ☐ a. For own waste only
   - ☐ b. For commercial purposes

Mode of Transportation
- ☐ 1. Air
- ☐ 2. Rail
- ☐ 3. Highway
- ☐ 4. Water
- ☐ 5. Other - specify

☐ 3. Treater, Storer, Disposer (at installation) Note: A permit is required for this activity; see instructions.

4. Hazardous Waste Fuel
   - ☐ a. Generator Marketing to Burner
   - ☐ b. Other Marketers
   - ☐ c. Boiler and/or Industrial Furnace
     - ☐ 1. Smelter Deferral
     - ☐ 2. Small Quantity Exemption

Indicate Type of Combustion Device(s)
- ☐ 1. Utility Boiler
- ☐ 2. Industrial Boiler
- ☐ 3. Industrial Furnace

☐ 5. Underground Injection Control

B. Used Oil Recycling Activities

1. Used Oil Fuel Marketer
   - ☐ a. Marketer Directs Shipment of Used Oil to Off-Specification Burner
   - ☐ b. Marketer Who First Claims the Used Oil Meets the Specifications
2. Used Oil Burner - Indicate Type(s) of Combustion Device(s)
   - ☐ a. Utility Boiler
   - ☒ b. Industrial Boiler
   - ☐ c. Industrial Furnace
3. Used Oil Transporter - Indicate Type(s) of Activity(ies)
   - ☐ a. Transporter
   - ☐ b. Transfer Facility
4. Used Oil Processor/Re-refiner - Indicate Type(s) of Activity(ies)
   - ☐ a. Process
   - ☐ b. Re-refine

IX. Description of Hazardous Wastes *(Use additional sheets if necessary)*

A. Characteristics of Nonlisted Hazardous Wastes. *(Mark 'X' in the boxes corresponding to the characteristics of nonlisted hazardous wastes your installation handles; See 40 CFR Parts 261.20 - 261.24)*

1. Ignitable (D001)	2. Corrosive (D002)	3. Reactive (D003)	4. Toxicity Characteristic	(List specific EPA hazardous waste number(s) for the Toxicity characteristic contaminant(s))

B. Listed Hazardous Wastes. *(See 40 CFR 261.31 - 33; See instructions if you need to list more than 12 waste codes.)*

1	2	3	4	5	6
D001	D008	F001	F005	D009	
7	8	9	10	11	12

C. Other Wastes. *(State or other wastes requiring a handler to have an I.D. number; See instructions.)*

1	2	3	4	5	6

X. Certification

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Signature	Name and Official Title *(Type or print)*	Date Signed
Raymond P. Oldach	Ray Oldach - Plant Manager	7/21/95

XI. Comments

Installation contact was changed on this revision.

Note: Mail completed form to the appropriate EPA Regional or State Office. *(See Section III of the booklet for addresses.)*

MATERIAL SAFETY DATA SHEET

Product Code: 03294

This form may be used to comply with OSHA's Hazard Communication Standard, 29 CFR 1910.1200.

IDENTITY (As Used on Label and List): #1325 Black to Red Jet Ink

SECTION I - Product Identification

Manufacturer Name and Address:
EASTERDAY FLUID TECHNOLOGIES, INC.
4343 S. KANSAS AVENUE
MILWAUKEE, WI. 53207-5327
USA

Telephone Numbers:
MANUFACTURER (414)482-4488
CHEMTREC (800)424-9300

Date Entered: 01/25/2000 Revision: 02/25/2000 Printed: 11/04/2003

Chemical Family:
DOT Hazard Label:

SECTION II - Hazardous Ingredients/Identity Information

	Hazardous Components (Specific Chemical Identity/Co	CAS #:	Percentage 43%	
1.	Methyl ethyl ketone {MEK; 2-Butanone}	78-93-3	0.0 -100.0	%
2.	Ethyl alcohol {Ethanol}	64-17-5	0.0 -100.0	%
3.	2-Propanol, 1-Methoxy- {Propylene glycol methyl ether}	107-98-2	0.0 -100.0	%
4.	Propanol, (2-Methoxymethylethoxy)- {(not 313)}	34590-94-8	0.0 -100.0	%

No heavy metals used in colorants

	OSHA PEL	ACGIH TLV
1.	200 ppm	300 ppm
2.	1000 ppm	1000 ppm
3.	100 ppm	100 ppm
4.	100 ppm	150 ppm

SECTION III - Physical/Chemical Characteristics

Physical States: [ ] Gas [X] Liquid [ ] Solid
Boiling Point: 175.00 F to 177.00
Melting Point: 32.00 F
Specific Gravity (Water = 1): . . . . 0.81 at 68.0 F
Vapor Pressure (vs. Air or mm Hg):. . 83 at 75.0 F
Vapor Density (vs. Air = 1):. . . . . >1
Evaporation Rate (vs Butyl Acetate=1): 6.0
Solubility in Water:. . . . . 26.30 at 68.0 F
Percent Volatile: . . . . . .
pH: . . . . . .
Appearance and Odor
Black Liquid

SECTION IV - Fire and Explosion Hazard Data

Flash Pt: 25.00 F
Method Used: tcc
Explosive Limits: LEL: 1.8 UEL: 11.5
Extinguishing Media

Product Code: 03294
Product Name: #1325 Black to Red Jet Ink

Special Fire Fighting Procedures

GENERAL HAZARD:
Flammable Liquid; may release vapors that form flammable mixtures when temperatures are at or above the flash point. Toxjc gasses will form upon combustion.
FIRE FIGHTING INSTRUCTIONS:
Either allow fire to burn out under controlled conditions or extinguish with foam or dry chemical. Try to cover liquid spills with foam. Use water spray to cool fire exposed surfaces. Avoid spraying water directly into storage containers due to danger of boilover. Shut off fuel to fire if possible to do so without hazard. If a spill has not ignited, use water spray to disperse the vapors.
FIRE FIGHTING E(~UIPMENT:
Respiratory and eye protection required for fire fighting personnel. Full protective equipment (Bunker Gear) and a self-contained breathing apparatus (SCBA) should be used for all
indoor fires and any significant outdoor fires. For small outdoor fires, which may easily be extinguished with a portable fire extinguisher, use of an SCBA may not be required.

Unusual Fire and Explosion Hazards

SECTION V - Reactivity Data

Stability: Unstable [ ] Stable [X]
Conditions To Avoid - Instability
This product is stable and hazardous polymerization will not occur
Incompatibility - Materials To Avoid
Strong oxidizing agents
Hazardous Decomposition Or Byproducts
HAZARDOUS COMBUSTION PRODUCTS: Smoke, fumes, and oxides of carbon.

Hazardous Polymerization: Will occur [ ] Will not occur [X]
Conditions To Avoid - Hazardous Polymerization
Will not occur.

SECTION VI - Health Hazard Data

Route(s) of Entry: Inhalation? No Skin? No Eyes? No Ingestion? No
Health Hazards (Acute and Chronic)
POTENTIAL HEAL TH EFFECTS:
INHALATION:
High vapor concentrations are irritating to the nose, throat, and lungs; may cause unconsciousness or other signs of central nervous system depression.
EYE CONT ACT:
Liquid and vapolrs are irritating to eyes. Can cause severe injury.
SKIN CONT ACT:
Frequent or prolonged contact may irritate the skin and cause a skin rash (dermatitis).May cause skin sensitization, an allergic reaction which becomes evident on re-exposure to this material.
INGESTION:
Small amounts of this liquid may be drawn into the lungs by either swallowing or vomiting. This may cause severe and delayed health effects such as inflammation of the lungs (pulmonary edema) and infection of the bronchi (bronchopneumonia). Ingestion may cause irritation of digestive tract and diarrhea.

Product Code: 03294
Product Name: #1325 Black to Red Jet Ink

CHRONIC EFFECTS:
There is no evidence that exposure to Methyl Ethyl Ketone (MEK, 2-Butanone) alone causes progressive or irreversible neurotoxic effects. However, simultaneous over-exposure to MEK and n-Hexane can potentiate the known irreversible neurotoxic effects of n-Hexane. There is no reported human evidence that these neurotoxic effects occur when exposure to both chemicals is maintained below established OSHA and ACGIH limits.

Carcinogenitics: NTP? No IARC Monographs? No OSHA No
Carcinogenicity/Other Information
NONE OF THE ABOVE ARE LISTED UNDER IARC-NPT-OSHA-ACGIH
Recommended Exposure Limits:
LD 50/LC 50:
Signs and Symptoms Of Exposure
Medical Conditions Generally Aggravated By Exposure
Emergency and First Aid Procedures
INHALATION:
Emergency Responders should use positive pressure air supplied respiratory protection when removing the affected victim from area. Keep the victim at rest. Give artificial respiration if breathing has stopped. Call for prompt medical attention.
EYE CONT ACT:
Immediately flush eyes thoroughly with water and continue flushing for at least 15 minutes. Seek medical attention.
SKIN CONT ACT:
Immediately flush with large amounts of water; use soap if available. Remove contaminated clothing, including shoes, after flushing has begun. Wash clothing before re-use. If irritation persists, seek medical attention.
INGESTION:
If swallowed, DO NOT induce vomiting. Keep at rest. Get prompt medical attention

Note to Physician

SECTION VII - Precautions for Safe Handling and Use

Steps To Be Taken In Case Material Is Released Or Spilled
LAND SPILL:
Notify the appropriate authorities immediately. Take all additional action necessary to prevent and remedy the adverse effects of the spill. Eliminate ignition source. Isolate hazard area
and deny entry to unauthorized or unprotected personnel. Shut off leak if safe to do so. Avoid runoff into storm sewers and ditches which lead to natural waterways. Contain spilled liquid with sand or earth. DO NOT use combustible materials such as sawdust. Absorb spill with an inert material (e.g., dry sand or earth). Then place in a chemical waste container.
WATER SPILL:
Remove from water surface by skimming or with suitable absorbents. If allowed by local environmental regulatory agencies, you may use a suitable dispersant.

Waste Disposal Method
Consult an expert on the disposal of recovered material. Ensure disposal in compliance with government requirements and ensure conformity to local disposal regulations. Suggested methods: Incineration or recover by distillation.

Product Code: 03294
Product Name: #1325 Black to Red Jet Ink

Precautions To Be Taken in Handling and Storing
Storage: Ambient

GENERAL:
Keep container closed .
Loosen closure cautiously before opening.
Store in a well ventilated place away from incompatible materials. Keep away from heat, sparks and flame. Protect material from direct sunljght.
Ground and bond containers when transferring materials. Do not breathe vapor.
Avoid contact with skin, eyes, and clothing.

Precautions To Be Taken in Storing
Other Precautions

SECTION VIII- Control Measures

Respiratory Equipment (Specify Type)
Ventilation
The use of mechanical dilution ventilation is recommended whenever this product is used in a confined space, is heated above ambient temperatures, or is agitated. Use explosion-proof ventilation equipment- PERSONAL PROTECTION:
Where exposure is likely to exceed acceptable criteria use NIOSH / MSHA approved respiratory protection equipment. Respirators should be selected based on the form and concentration of contaminant in air and in accordance with OSHA (29 CFR 1910.134)

Eye Protection
Protective Gloves
Other Protective Clothing
Wear gloves an protective clothing which are impervious to this product for the duration of anticipated exposure if there is potential for skin contact
Work/Hygienic/Maintenance Practices

SECTION IX - Additional Comments

NOTE:
The flash point of this product has not been determined. The solvent with the lowest flash point of the mixture was used.

DISCLAIMER OF LIABILITY .
The information contained herein is based on the data available to us and is, to the best of our knowledge and belief, accurate. However, since the conditions of handling and use are beyond our control, we assume no liability for damages incurred by use of this material. Although certain hazards are described herein, we cannot guarantee that these are the only hazards which may exist. Users of any product shoul(j satisfy themselves that the conditions and methods of use assure that the product is used safely. No representations or warranties, either express or implied, of any nature are made hereunder with respect to the information contained herein. It is the responsiblility of the user to comply with any and all federal, state, and local law and regulations which may exist. Nothing contained herein is to be construed as a recommendation for use in violation of any applicable laws or regulations.

SECTION III - Physical/Chemical Characteristics

Physical States: [ ] Gas [X] Liquid [ ] Solid
Boiling Point: 175.00 F
Melting Point:
Specific Gravity (Water = 1): 0.000000
Vapor Pressure (vs. Air or mm Hg):. .
Vapor Density (vs. Air = 1):. . . . .
Evaporation Rate (vs Butyl Acetate=1):
Solubility in Water:. . . . . .
Percent Volatile: . . . . . .
pH: . . . . . .
Appearance and Odor

SECTION IV - Fire and Explosion Hazard Data

Flash Pt: 21.00 F
Method Used: TAG CLOSED CUP ASTM D 56
Explosive Limits: LEL: UEL:

Product Code: 02496
Product Name: MAKEUP (SOLVENT) EASTERDAY SOLVENT

Extinguishing Media
Apply alcohol-type or all-purpose-type foams by manufacturer's recommended techniques for large fires. Use CO2 or dry chemical media for small fires.
Special Fire Fighting Procedures
Use water spray to cool fire-exposed containers and structures. Use water spray to disperse vapors: reignition is possible. Use self-contained breathing apparatus and protective clothing.
Unusual Fire and Explosion Hazards
Vapors form from this product and may travel or be moved by air other flames, sparks, heaters, electrical equipment, static discharges or other ignition sources at locations distant from product handling point.
Vapors may settle in low or confined areas, or travel a long distance to an ignition source and flash back explosively.
This material may product a floating fire hazard.

SECTION V - Reactivity Data

Stability: Unstable [ ] Stable [X]
Conditions To Avoid - Instability
HEAT; FIRE; IGNITION SOURCES
Incompatibility - Materials To Avoid
AVOID STRONG OXIDIZING AGENTS, ALKALINE MATERIALS, MINERAL ACIDS, AND HALOGENS.
Hazardous Decomposition Or Byproducts
BURNING CAN PRODUCE CARBON MONOXIDE AND/OR CARBON DIOXIDE.
Hazardous Polymerization: Will occur [ ] Will not occur [X]
Conditions To Avoid - Hazardous Polymerization

SECTION VI - Health Hazard Data

Route(s) of Entry: Inhalation? No Skin? No Eyes? No Ingestion? No
Health Hazards (Acute and Chronic)
EFFECTS OF ACUTE OVEREXPOSURE METHYL ETHYL KETONE AND ETHANOL :
SWALLOWING: Moderately toxic. May cause nausea, abdominal discomfort, vomiting, and diarrhea.

SKIN ABSORPTION: No evidence of adverse effects from available information.

INHALATION: Vapors are irritating to the eyes, nose and respiratory tract. Concentrations in excess of the TLV have and objectionable odor, and can cause more severe irritation, headache, dizziness, nausea, vomiting and possibly unconsciousness.

SKIN CONTACT: Brief contact causes redness. Prolonged contact with either the liquid or vapor can cause drying and cracking of the skin due to defatting action.

EYE CONTACT: Causes severe irritation, seen as marked excess redness and swelling of the conjunctiva.

EFFECTS OF REPEATED OVEREXPOSURE: No evidence of adverse effects from available information.

EFFECTS OF ACUTE OVEREXPOSURE PROPYLENE GLYCOL MONOMETHYL ACETATE:

Product Code: 02496
Product Name: MAKEUP (SOLVENT) EASTERDAY SOLVENT

INHALATION: High vapor concentrations may cause irritation.

EYES: Low hazard for usual industrial handling. However, any material that contacts the eye may be irritating or may cause mechanical iniury.

SKIN: Low hazard for usual industrial handling.

INGESTION: -Expected to be a low ingestion hazard.

Carcinogeniticy: NTP? No IARC Monographs? No OSHA No
Carcinogenicity/Other Information
Recommended Exposure Limits:
LD 50/LC 50:
Signs and Symptoms Of Exposure
Medical Conditions Generally Aggravated By Exposure
METHYL ETHYL KETONE AND ETHANOL :
This material may aggravate an existing dermatitis. Breathing of vapor and/or mist may aggravate asthma and inflammatory or fibrotic pulmonary disease.
Emergency and First Aid Procedures
METHYL ETHYL KETONE AND ETHANOL :
SWALLOWING: Do not induce vomiting.
CALL A PHYSICIAN.

SKIN: Flush with water. Wash contaminated clothing before wearing again. -
INHALATION: Remove to fresh air. Give artificial respiration if not breathing. Qualified personnel may give oxygen if breathing is difficult.
CALL A PHYSICIAN.
EYES: Immediately flush eyes thoroughly with water and continue flushing for at least 15 minutes. Seek medical attention.

NOTES TO PHYSICIAN: Methyl-ethyl-ketone is especially toxic if aspirated Stomach contents should be evacuated in a manner which avoids aspiration. There is no specific antidote. Treatment of overexposure should be directed at the control of symptoms and the clinical condition of the patient.

PROPYLENE GLYCOL MONOMETHYL ACETATE:

INHALATION: If symptomatic, remove to fresh air and get medical attention if symptoms persist. -

EYES: Any material that contacts the eye should be washed out immediately and medical attention obtained if symptoms persist.

SKIN: Wash with soap and water and get medical attention if symptoms occur.

INGESTION: CALL A PHYSICIAN OR POISON CONTROL CENTER IMMEDIATELY. Induce vomiting as directed by medical personnel. Never give anything by mouth to an unconscious person.

Note to Physician

Product Code: 02496
Product Name: MAKEUP (SOLVENT) EASTERDAY SOLVENT

Protective Gloves
BUTYL RUBBER.
Other Protective Clothing
CHEMICAL APRON, EYE BATH AND SAFETY SHOWER.
Work/Hygienic/Maintenance Practices

SECTION IX - Additional Comments

THE INFORMATION CONTAINED HEREIN IS BASED ON THE DATA AVAILABLE TO US AND, IS TO THE BEST OF OUR KNOLEDGE AND BELIEF, ACCURATE. HOWEVER, SINCE THE CONDITIONS OF HANDLING AND USE ARE BEYOND OUR CONTROL, WE ASSUME NO LIABILITY FOR DAMAGES INCURRED BY USE OF THIS MATERIAL. ALTHOUGH CERTAIN HAZARDS ARE DESCRIBED HEREIN, WE CANNOT GUARANTEE THAT THESE ARE THE ONLY HAZARDS WHICH MAY EXIST. USERS OF ANY PRODUCT SHOULD SAEISFY THEMSELVES THAT THE CONDITIONS AND METHODS OF USE ASSURE THAT THE PRODUCT IS USED SAFELY. NO REPRESENTATIONS OR WARRANTIES, EITHER EXPRESS OR IMPLIED, OF ANY NATURE ARE MADE HEREUNDER WITH RESPECT TO THE INFORMATION CONTAINED HEREIN. VIII. Type of Regulated Waste Activity *(Mark 'X' in the appropriate boxes; Refer to Instructions)*

A. Hazardous Waste Activity

1. Generator (See Instructions)
   - ☐ a. Greater than 1000kg/mo (2,200 lbs.)
   - ☒ b. 100 to 1000 kg/mo (200-2,200 lbs.)
   - ☐ c. Less than 100 kg/mo (220 lbs)
2. Transporter (Indicate Mode in boxes 1-5 below)
   - ☐ a. For own waste only
   - ☐ b. For commercial purposes

Mode of Transportation
- ☐ 1. Air
- ☐ 2. Rail
- ☐ 3. Highway
- ☐ 4. Water
- ☐ 5. Other - specify

☐ 3. Treater, Storer, Disposer (at Installation) Note: A permit is required for this activity; see instructions.

4. Hazardous Waste Fuel
   - ☐ a. Generator Marketing to Burner
   - ☐ b. Other Marketers
   - ☐ c. Boiler and/or Industrial Furnace
     - ☐ 1. Smelter Deferral
     - ☐ 2. Small Quantity Exemption

Indicate Type of Combustion Device(s)
- ☐ 1. Utility Boiler
- ☐ 2. Industrial Boiler
- ☐ 3. Industrial Furnace

☐ 5. Underground Injection Control

B. Used Oil Recycling Activities

1. Used Oil Fuel Marketer
   - ☐ a. Marketer Directs Shipment of Used Oil to Off-Specification Burner
   - ☐ b. Marketer Who First Claims the Used Oil Meets the Specifications
2. Used Oil Burner - Indicate Type(s) of Combustion Device(s)
   - ☐ a. Utility Boiler
   - ☒ b. Industrial Boiler No longer
   - ☐ c. Industrial Furnace
3. Used Oil Transporter - Indicate Type(s) of Activity(ies)
   - ☐ a. Transporter
   - ☐ b. Transfer Facility
4. Used Oil Processor/Re-refiner - Indicate Type(s) of Activity(ies)
   - ☐ a. Process
   - ☐ b. Re-refine

IX. Description of Hazardous Wastes *(Use additional sheets if necessary)*

A. Characteristics of Nonlisted Hazardous Wastes. *(Mark 'X' in the boxes corresponding to the characteristics of nonlisted hazardous wastes your installation handles; See 40 CFR Parts 261.20 - 261.24)*

1. Ignitable (D001)	2. Corrosive (D002)	3. Reactive (D003)	4. Toxicity Characteristic	(List specific EPA hazardous waste number(s) for the Toxicity characteristic contaminant(s))
☐	☐	☐	☐	

B. Listed Hazardous Wastes. *(See 40 CFR 261.31 - 33; See instructions if you need to list more than 12 waste codes.)*

Re: Request for Permission to Discharge
Campbell Soup WWTP, Napoleon Facility

Dear Mr. Poffenbarger:

On August 1, 2002, the Ohio Environmental Protection Agency (Ohio EPA) approved, with modifications, the *RCRA Site Closure Plan, Former Holding Pit Unit,* (Closure Plan), dated May 24, 2002, for the Campbell Soup Supply Company in Napoleon, Ohio. During implementation of the Closure Plan, field generated wastewater will need to be managed. We communicated with you about this issue in an 'e-mail' correspondence dated July 16, 2002, and a follow-up phone call on November 4, 2002. The purpose of this letter is to request that the Ohio EPA grant Campbell Soup "permission to discharge" the field generated wastewater to the Campbell Soup Wastewater Treatment Plant (WWTP).

BACKGROUND

Prior to 1981, spent coating materials and solvents from the Plant's former can manufacturing operation were stored in 55-gallon drums and eventually used as boiler fuel supplement. Over time, solids accumulated in the drums, complicating handling of the spent solvents and drums. To manage the solids, a temporary holding pit was constructed to receive and dry the solids prior to off-site disposal. The holding pit was active from 1981 until it was demolished in 1983. Subsequent subsurface investigations have confirmed the presence of volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) in the soils and perched groundwater surrounding the former holding pit.

SOURCE AND ESTIMATED VOLUME OF WASTE WATER

The primary source of the field generated wastewater is "perched" water trapped within the permeable sediments under the former holding pit. The perched water is impacted with volatile and semi-volatile organic compounds (VOCs, SVOCs). Concentrations of contaminants observed in the perched water are provided in Table 1. Review of lithologic data presented in the Closure Plan indicates that the perched water is encountered at an approximate depth of 6.6 feet below surface grade and that the maximum thickness of the saturated unit is approximately 11.5 feet. The perched water is contained within permeable sediments that are above natural grade, and are

not in direct contact with groundwater. Therefore, the volume of water that will be generated is finite, and will only increase with the addition of precipitation or decontamination water.

Because the excavation will be completed in tiers that decrease in size with depth, soil volumes were estimated for each tier (Appendix A). The volume of each tier was added together for a total saturated soil volume of 53,264 ft^3 (1,973 yds^3). The volume of saturated soil was multiplied by the average specific yield (effective porosity) for a medium sand, 26% (Fetter, 1988) resulting in approximately 13,849 ft^3 or 103,590 gallons of potential perched water in the excavation area. This is a very conservative estimate that assumes the entire mound area contains perched water and all of the water will be released from the soil pores. During field investigations we determined approximately ¼ of the mound contained perched water, which would result in approximately 26,000 gallons of perched water that would need to be collected during excavation activities.

Wastewater will also be generated as equipment is decontaminated. Although the excavation will be covered with visquene during work stoppages, some contaminated soil may come in contact with rainwater during field activities. The maximum volume of wastewater generated from rinseate and precipitation is not expected to exceed 30,000-gallons.

CHEMICALS OF CONCERN

The materials stored in the former holding pit generally were associated with wastes recovered from the enamel coating process for the inside of food containers. Chemicals that were actually detected in the soils under the former holding pit include the following:

- chloromethane (methyl chloride)
- bromomethane
- methylene chloride
- chloroform
- benzene*
- trichloroethene
- toluene*
- ethylbenzene*
- total xylenes*
- styrene*
- isopropylbenzene (cumene)*
- 1,2,3-trichloropropane
- n-propylbenzene*
- 1,3,5-trimethylbenzene
- tert-butylbenzene*
- 1,2,4-trimethylbenzene*
- sec-butylbenzene*
- p-isopropyltoluene*
- n-butylbenzene*
- 1,2,4-trichlorobenzene*
- naphthalene*
- 2-methylnaphthalene*
- methyl 4,-2-propanone (MIBK)*
- 2-Butanone (MEK)
- acenaphthene
- fluorene
- phenanthrene
- anthracene
- fluoranthene
- pyrene
- benzo(a)anthracene
- chrysene
- benzo(b)fluoranthene
- benzo(k)fluoranthene
- benzo(a)pyrene
- indeno(1,2,3-cd)pyrene
- benzo(g,h,i)perylene
- 1,4-Dichlorobenzene

Those chemicals marked with an "*" are chemicals that were detected in the perched water within the mound. The maximum concentrations observed in the perched water are shown in Table 1.

These are the maximum concentrations of organics expected in all of the field generated wastewater, as the perched water will have the highest levels of organics due to its continuous contact with the contaminated soils.

Available outside mixing zone maximum (OMZM) values obtained from the Ohio EPA Water Quality Standards for the Lake Erie basin are shown for each chemical of concern in Table 1.

WASTEWATER MANAGEMENT PLAN

Water removed from the excavation and wastewater generated during decontamination activities will be stored onsite in a 20,000-gallon frac tank. When the tank is near full, the water will be transported via a vacuum truck to a manhole located before the head of the WWTP. The Ohio EPA will be notified one business day prior to the initial discharge to the WWTP. The field generated wastewater will be discharged prior to the head of the WWTP and will be subject to all treatment processes. The WWTP treatment process, as described in Appendix B, is designed to treat organics, treats over 8 million gallons per day, and has a total detention time of approximately 3.5 days. Since the wastewater will never leave the Campbell Soup property, waste manifests will not be required.

CONFIRMATION SAMPLING PROCEDURES

The quality of the WWTP influent will not be significantly affected by the additional discharge of the field generated wastewater. The concentrations of the chemicals of concern at the head of the WWTP are expected to be orders of magnitude lower than the OMZM limitations, as shown in Table 1. However, to ensure the WWTP influent does not exceed the OMZM values during the wastewater discharge event, confirmation samples will be taken from the on-site temporary storage frac tank prior to discharge to the WWTP. The samples will be collected in clean laboratory supplied containers and preserved according to laboratory procedures. The samples will be transported on ice to the laboratory where they will be analyzed for the VOCs and SVOCs indicated on Table 1 (the field generated wastewater will be analyzed against those compounds with OMZM values shown on Table 1). Discharge to the WWTP will only occur if the confirmation samples are below the 'required concentration of field generated wastewater for influent to equal OMZM WQS' as shown in Table 1.

Discharge limits were not available for all compounds detected in the perched water or soil under the former holding pit. It is expected that compliance with the established discharge limits will be sufficiently protective to ensure that the quality of the WWTP effluent will not be adversely affected. A comparison of the analytical concentrations of the discharge water and the proposed limitations should be considered a good indicator of the overall quality of the discharge water.

FOLLOW-UP REPORT

A follow-up report will be submitted to the Ohio EPA within 30 days of the final discharge. The report will contain the dates the discharges occurred, the volumes and duration of all discharges and a summary of all analytical results.

This letter is intended to provide all the information necessary to obtain "Permission to Discharge" to the Campbell Soup WWTP. If you have any further questions, please do not hesitate to call me at 734-213-5042.

Thank you,

Craig Savage, CPG

APPENDIX C

MASS BALANCE CALCULATIONS

This appendix presents the mass balance calculation logic that was followed to perform the calculations shown in Table 1.

The following assumptions were made:

- The flow of the Campbell Soup WWTP is 8,000,0000 gallons per day.
- The flow of the field generated wastewater is 20,000 gallons per day.
- The concentrations of the COCs from the Campbell Soup collection system = 0 ppb.

Estimated WWTP Influent (ug/L)

$c_1 q_1 + c_2 q_2 = QC$

q_1 = flow of field generated wastewater = 20,000 gallons/day
c_1 = concentration of field generated wastewater for each COC
q_2 = flow of Campbell WWTP = 8 MGD
c_2 = concentrations of COCs in Campbell Soup wastewater = 0 ppb
Q = total flow during field generated discharge event = 8,020,000 gallons
C = ? = Expected WWTP influent during field generated wastewater discharge event.

$$C = \frac{c_1 q_1}{Q} = \frac{c_1 * 20{,}0000}{8{,}020{,}000}$$

Required Concentration (c_1) of Field Generated Wastewater for influent to equal OMZM

$c_1 q_1 + c_2 q_2 = QC$

q_1 = flow of field generated wastewater = 20,000 gallons/day
c_1 = ? = concentration of field generated wastewater for each COC
q_2 = flow of Campbell WWTP = 8 MGD
c_2 = concentrations of COCs in Campbell Soup wastewater = 0 ppb
Q = total flow during field generated discharge event = 8,020,000 gallons
C = WWTP influent during field generated wastewater discharge event = OMZM values.

$$c_1 = \frac{C*Q}{q_1} = \frac{C*8{,}020{,}000}{20{,}000}$$

Financial Assurance Documents

Gentleman:

At the request of Messrs. Harry Sarvis and Todd Anderson, I am providing you this follow-up to the letters of July 18, 2002 and August 1, 2002 regarding the financial assurance documents submitted by Campbell Soup Company ("Campbell") pursuant to the Director's Final Findings and Order, dated October 18, 2000 (as amended August 2001) (the "Order"). The Order relates to Campbell's property located at 12773 State Route 110, Napoleon, Ohio (the "Property"). Messrs. Sarvis and Anderson requested I provide you with the following information:

- The Property's EPA identification number is OHD 005 419 171.
- The lending institution for the closure letter of credit is JP MorganChase Bank.
- The amount of the closure letter of credit is five hundred eighty six thousand five hundred and twenty three dollars ($586,523).

- The lending institution for the third-party liability letter of credit is JP MorganChase Bank.
- The amount of the third party liability letter of credit is one million dollars ($1,000,000) per occurrence with an annual aggregate amount of two million dollars ($2,000,000).

If you require any additional information, please do not hesitate to contact me.

Sincerely,

Mark Migliaccio

RE: Campbell Soup Company, Napoleon Site
September 2002 Soil Sample Results

Dear Mr. Moseley,

On October 2, 2002, a geologist with GeoTrans, Inc. returned to the Campbell Soup Company's Napoleon, Ohio, plant to re-collect soil samples to complete delineation around the "former holding pit" site. These samples were necessary to replace samples collected during the week of August 26, 2002, which were not analyzed within allowable holding times by the analytical laboratory. These soil samples were collected in accordance with the approved Modified Closure Plan, and following notification to and verbal approval from the Ohio EPA.

The samples were collected from soil borings completed 1-2 feet away but at the same depth intervals as the borings completed on August 26 and 27, 2002. Soil cores were retrieved within a four-foot long clear acetate liner using a GeoProbe™ sampling rig. Soil samples were extracted from the target interval by cutting the acetate liner and inserting an Encore™ sampler into the soil core.

Because groundwater samples were collected from MW-1, MW-2 and MW-3 from the 15 to 20 foot depth interval, additional soil samples were not collected from the deep interval during the re-sampling at these locations. Therefore, a total of 12 samples were submitted for laboratory analysis instead of the 15 samples collected previously. 10 soil samples were collected from the 4- to 5-foot depth interval and two were collected from the 19.5- to 20-foot depth interval (at locations where wells were not installed previously). Samples were collected in triplicate and submitted to BEC Laboratories, Inc. (BEC) in Toledo, Ohio, for VOC analysis on September 2, 2002.

Laboratory analytical results are presented in the attached Table 1 and the complete laboratory report is also attached. The low-level method 8270b practical quantification limit (PQL) for each parameter is presented. Sample results detected above the PQL but

below the sample quantification limit appear in parentheses. A summary of the analytical results is provided below:

- All groundwater samples and soil samples collected from the 19.5- to 20-foot depth interval showed concentrations below the all detection limits for all compounds analyzed.

- M- & p-xylenes, carbon disulfide, and 1,1-dichloropropene were identified below the quantification limit for the individual samples but above the low-level method PQL. An estimate of these concentrations (in parentheses) is included in Table 1 and in the laboratory report.

- Toluene was detected above the low-level method PQL and the sample quantification limit in samples collected at five locations across the site: PB-02-52 (26.6 parts per billion (ppb)), PB-02-54 (78.9 ppb), PB-02-57 (41.4 ppb), PB-02-58 (82.6 ppb), and MW-1 (62.5 ppb).

There is no reason to expect that the compounds found in these samples are associated with the former holding pit area. These samples were collected from an area some distance from the former holding pit, and represent native soils undisturbed by the re-grading activities in the mounded area of the holding pit. Visual observations of the soil columns during fieldwork activities indicated these soils were native. No carbon disulfide was found in any of the fifty samples analyzed during the previous investigations within the former holding pit area. Also, of the samples collected during the investigations within the former holding pit area, only one sample showed detectable concentrations of 1,1-dichloropropene, compared to the eight samples from the native areas with detectable concentrations of this contaminant. The fact that toluene was the only compound detected above quantifiable limits is difficult to explain, as this compound, while present, was by no means the most prevalent compound in the former holding pit study area.

In addition, the compounds present in these samples were not detected in other nearby soil samples, collected during the previous investigation. Toluene, 1,1-dichloropropene, carbon disulfide, and xylenes were not detected in any samples collected from outermost borings PB-01-36, PB-01-39, PB-01-38, PB-01-47, PB-01-48, PB-01-49, PB-01 44, and PB-01-50.

We can think of no logical reason for the occurrence of such a suite of compounds in the recent samples, especially considering the relative absence of other compounds more prevalent in the holding pit area soils. An alternate source for these compounds or some unexplained cross contamination is the only reasonable explanation. Therefore, we request that the soil investigation be considered complete, and that the implementation of the closure plan be initiated this November, as planned.

If you have any questions regarding these matters please do not hesitate to call me at 734.213.5042.

Sincerely,

Michael Kosmerl for

Craig A. Savage
Associate Hydrogeologist
Project Manager

Cc: Dr. Osman Aly, Campbell Soup

Financial Assurance

Osman M. Aly,
Campbell Soup Company
1 Campbell Place
Camden, New Jersey 08103

Dear Mr. Aly:

On September 30, 2002, Ohio EPA conducted a review of the financial assurance and liability coverage documentation on file for the Campbell Soup Company. I evaluated the Napoleon Ohio facility for compliance with closure/post-closure cost estimate, closure/post-closure care and liability coverage requirements as set forth in Ohio Administrative Code (OAC) rules 3745-66-42 through 3745-66-47 and the August 2001 Amended Director's Final Findings and Orders (Orders).

On October 18, 2000, Orders were issued for the Campbell Soup Company. These Orders were amended August 22, 2001. The Orders, Section V.1.b, requires that Campbell Soup establish financial assurance for closure and liability coverage.

Financial assurance documentation was submitted July 23 and August 2, 2002. To demonstrate financial assurance for closure/post care requirements Campbell Soup submitted Letter of Credit (LOC) No. P-226892 and standby trust agreement issued by JP Morgan Chase Bank. To demonstrate financial assurance for liability requirements Campbell Soup submitted LOC No. P-226893 and a standby trust agreement issued by JP Morgan Chase Bank.

GENERAL CONCERNS:

The LOC and the Standby Trust Agreement received July 23, and August 2, 2002 do not have the exact wording as required.

The LOC and Standby Trust Agreements must be worded exactly as specified in the OAC rules 3745-55-51. The closure/post-closure LOC must be worded identical to

OAC rule 3745-55-51(D) and have a Standby Trust Agreement worded with the exact wording of OAC rule 3745-55-51 (A). The liability LOC must be worded identical to OAC rule 3745-55-51 (K) and have a Standby Trust Agreement worded with exact wording of OAC rule 3745-55-51(M).

These financial assurance mechanisms must be revised to include the exact wording. Please have the JP Morgan Chase Bank representative contact me if there are questions about the wording of the LOC and Standby Trust Agreement. Violations are not being cited at this time but your current financial assurance submittals are deficient and need to be corrected.

The correct wording must be submitted within 15 days of receipt of this letter.

If you have any questions, do not hesitate to contact me at (614)644-2951.

Sincerely,

Tina Jennings

RE: Campbell Soup Company, Napoleon Site
August 2002 Soil Samples

Dear Mr. Moseley,

On August 26 and 27, 2002, in accordance with the approved modified Closure Plan, GeoTrans geologists collected soil samples at 15 locations at the Campbell Soup Company Napoleon, Ohio, site using Encore sampling tools. Three replicate samples for each location were submitted to BEC Laboratories, Inc. (BEC) in Toledo, Ohio on August 27, 2002.

We contacted BEC on September 16, 2002 to check on the status of our samples. We did not hear from BEC until September 19, 2002. On September 19, 2002, Mr. John Blair of BEC indicated that there were several problems with our samples. He explained that the samples were extracted within the required 48-hour time frame, but the extracts were not run until September 7, or ten days into the 14-day holding time. The QA surrogate samples failed their required QA tests to demonstrate acceptable recovery. Equipment failure prevented the samples from being re-run and the sample extracts were set aside well past their acceptable holding times. Conversations with BEC chemists and our own internal Ph.D. analytical chemists confirm that the samples are now unusable.

GeoTrans plans to re-sample the soil from the same general vicinity and depths as completed on August 26 and 27, 2002, in accordance with the modified Closure Plan, with one exception. Since groundwater samples were collected from MW-1, MW-2 and MW-3 from 15 to 20 feet below surface grade (bsg), soil samples will not be collected from this interval during the re-sampling. Therefore, a total of 12 samples will be submitted for laboratory analysis instead of the 15 samples collected previously, 10 from 4-5 feet bsg at locations presented in Figure 1 of the Shallow Groundwater Report, dated September 25, 2002, and 2 from 19.5-20 feet bsg at PB-02-54 and PB-02-56. We plan to complete this soil re-sampling on Wednesday October 2, 2002.

Also, per your e-mail request dated September 27, 2002, we have attached the QA/QC report from the laboratory analysis of the groundwater samples collected on September 9, 2002.

If you have any questions regarding these matters please do not hesitate to give me a call at 734.213.5042.

Sincerely,

Craig A. Savage
Associate Hydrogeologist
Project Manager

Re: Campbell Soup RCRA Closure Plan, Napoleon Facility

We are enclosing: Shallow Groundwater Report

Remarks:

On behalf of the Campbell Soup Supply Company, GeoTrans is submitting two (2) copies of the Shallow Groundwater Report, summarizing the shallow groundwater investigation that occurred on August 26 and 27, 2002.

Please call me at (734) 213 – 4068 with any questions.

Remarks:

The approved RCRA Closure Plan schedule for the Campbell Soup facility in Napoleon, Ohio, requires submittal of the waste characterization analytical results by August 31, 2002. The laboratory report and chain-of-custody documentation for waste characterization samples PB-01, PB-01-32, and PB-01-34 were submitted to the OEPA on August 21, 2002. The final waste characterization sample, PB-01-28, was collected on August 26, 2002. Attached is a preliminary laboratory report for the final waste characterization sample. The final laboratory report will be submitted to you at a later date.

Per Section 8 (Schedule) of the approved RCRA Closure Plan we are submitting the analytical results from the Waste Characterization that was completed in accordance with Section 14.4 of the Closure Plan. Samples were collected from PB-01-32, PB-01-34 and PB-01 on May 29, 2002, using a hand auger. Due to hand auger refusal we were unable to collect the waste characterization sample from PB-01-28. The analytical results from PB-01-32, PB-01-34 and PB-01 are attached, showing the soils at the site are non-hazardous. We will collect the final Waste Characterization Sample on 8/26/02 using a GeoProbe. We will submit the analytical results of the final waste characterization sample at a later date.

Per Modification #5 to the RCRA Site Closure Plan enclosed is copy of the site health and safety plan for the additional site characterization activities. We have tentatively scheduled drilling for the week of August 26th. In accordance with the Closure Plan we will formally notify you five days prior to initiating any field activities. We will submit a second health and safety plan for the remediation field work at a later date. Please call me at (734) 213 - 4068 with any questions.

1.0 GENERAL INFORMATION

Site/Location: Campbell Soup Company, Napoleon, Ohio Project #: P896

Plan Prepared by: Michelle Racz Date: 8/13/02

Hazard Assessment Prepared by: * Michelle Racz Date: 8/13/02

* I certify that I have assessed the type, risk level and severity of hazards for this project and have selected appropriate personal protective equipment for site personnel.

Plan Reviewed by: Joe Essichick Date: 8/13/02

Activity(s): Advancement of eleven geoprobe borings outside former holding pit area. Ten borings will be advanced to a maximum depth of twenty feet below surface grade (bsg). Three of these borings will be completed as permanent 2" monitoring wells. Soil and groundwater samples will be collected. One boring will be advanced to approximately 6 feet bsg and soils collected for waste characterization.

Dates of work: August 20-30, 2002

GeoTrans personnel:	Signature
Michael Kovacich	
Kate Van Fleet	
Michelle Racz	

Description of Site: (include map if possible)

The Napoleon Plant is situated along the south floodplain of the Maumee River in Napoleon, Ohio. The general site topography is flat, however the former folding pits were constructed on an elevated mound of fill dirt, approximately 15 – 20 feet higher than natural grade. Unpaved road access to the holding pit area site is from the southeast. The mound is relatively flat on the surface and drops off abruptly to the east, north and west. The former holding pits were removed, regraded, and covered with approximately 4 feet of new fill in 1983.

Types of hazardous material:

Soils and groundwater may be impacted with volatile and/or semi-volatile organic compound contamination. See attached Table for Potential Chemical Hazards at the site.

Major safety/health hazards/risks: (contamination, equipment, fire etc.)

Hazards include:

- Injury from trip and fall
- Injury from moving equipment and machinery
- Loud noise

- Encountering buried utilities-electrocution
- Heat stress
- Insect bites
- Poison Ivy

See attached Table for task hazard analysis and controls

---

* Safety coordinator/emergency coordinator-Site Safety co-ordinator is Mike Kovacich

** Designated First-Aid provider-All GeoTrans employees on-site are training in providing First Aid

2.0 SAFETY PLAN

Protective Equipment/Instruments (specify type, as necessary)

Hard hat:	X	Boots:	X	Glasses (type):	X
Suits:		Respirator:	X	First aid kit:	X
PID:	X	CGI:		Hearing Protectors:	X

Safety Equipment Levels/Upgrades: Level D

Monitoring Requirements: Monitoring of ambient air with PID. If site conditions or results of the air monitoring performed during on-site activities warrant a higher level of protection, all field personnel will withdraw from the site , immediately contact the site safety coordinator and wait for further instructions. Attached table lists site-specific air monitoring requirements and action levels.

Decontamination/Work Zone Requirements: Remove PPE and decontaminate sampling equipment using soap and water rinse before leaving work area.

3.0 EMERGENCY PLANNING

Emergency Phone Numbers

Hospital/Emergency Clinic: Henry County Hospital Address: 11600 State Route 424, Napoleon, Ohio. Phone number : (419) 592-4015 (general and emergency)

Note: Map of route to hospital must be attached.

Fire Department: 911

Police: 911

GeoTrans Contact (PM or H&S officer): Joe Esseichick (734) 213-4057 or Craig Savage (734) 213-5042

POTENTIAL CHEMICAL HAZARDS
FORMER HOLDING PIT SITE

Chemical and Description	Exposure Limits and IDLH Level	Exposure Routes	Toxic Characteristics
Acetone - liquid, identified in soil	OSHA PEL - 1000 ppm IDLH - 2500 ppm	Inhalation Ingestion Skin and eye contact	Irritation to eyes, nose, throat; headache, dizziness, CNS depression; dermatitus and eye irritation
2-Butanone (MEK) - liquid, identified in soil	OSHA PEL - 299 ppm IDLH - 1700 ppm	Inhalation Ingestion Skin and eye contact	Irritation to eyes and nose; headache, dizziness, vomiting; skin irritation
1,4-Dichlorobenzene - crystaline solid, identified in soil	OSHA PEL - 75 ppm IDLH - 150 ppm (CA)	Inhalation Dermal absorption Ingestion Skin contact	Irritation to eyes and nose; liver and kidney damage;skin blisters
Ethylbenzene - liquid, identified in soil	OSHA PEL - 100 ppm IDLH - 800 ppm	Inhalation Ingestion Skin and eye contact	Irritation to eyes, skin & mucus membranes; headache; dermatitus; norcosis; coma
Hexone (MIBK) - liquid, identified in soil	OSHA PEL - 100 ppm IDLH - 500 ppm	Inhalation Ingestion Skin/eye contact	Iriitation to eyes, skin , mucus membrane; headache, narcosis, coma; dermatitus; liver and kidney damage in animals
Naphthalene - solid, identified in soil	OSHA PEL - 10 ppm IDLH - 250 ppm	Inhalation Dermal absorption Ingestion Sin and eye contact	Irritation to eyes; headache, confusion, excitement, malaise, nausea, vomiting, abdominal pain; irritation of the bladder; profuse sweating; jaundice; hematuria, hemoglobiurea, renal shutdown; dermatitus; optical neuritus, corneal damage

Toluene - liquid, identified in soil	OSHA PEL - 200 ppm IDLH - 500 ppm	Inhalation Dermal absorption Ingestion Skin and eye contact	Irritation to eyes, nose; fatigue, weakness, confusion, euphoria, dizziness, headache; dilated pupils, lacrimation; nervousness, muscle fatigue, insomnia; paresthesia; dermatitus; liver and kidney damage
Xylenes - liquid, identified in soil	OSHA PEL - 100 ppm IDLH - 900 ppm	Inhalation Skin absorption Ingestion Skin & eye contact	Irritation to eyes, skin nose, throat; dizziness, excitement, drowsiness, incoherence, staggering gait; corneal vacuolization; anorexia, nausea, vomiting, abdominal pain; dermatitus
Other alcohols, ethers, ketones, and formaldehyde have not been detected but are potentially present in the source material	Various exposure limits	Various exposure routes	Various acute and chronic symptoms

Notes:

IDLH	Immediately dangerous to life or health
OSHA	Occupational Health and Safety Administration
PEL	Permissible exposure limit
ppm	Part per million

SITE-SPECIFIC AIR MONITORING REQUIREMENTS AND ACTION LEVELS

Contaminant or Hazard	Activity	Monitoring Device	Frequency	Action Level	Action
Organic Vapors	Soil sampling Excavation	PID	Every 30 to 60 minutes	Background to 5 ppm	Use Level D or Modified Level D PPE
			Every 30 minutes	5 to 100 ppm	Use Level C PPE (unless specific chemicals are identified and evaluated using detector tube)
			NA	> 100 ppm	Stop work and evacuate area; implement vapor suppression controls. Notify SSC

Notes:

NA	Not applicable
PID	Photoionization detector
PPE	Personal protective equipment
ppm	Part per million
SSC	Site safety coordinator

TASK HAZARD ANALYSIS
FORMER HOLDING PIT SITE

Task or Activity	Potential Hazard	Controls	Initial Level of Protection	Upgraded Level of Protection
Soil Borings/soil sample collection	Potential hazards include chemical and physical hazards.	Use of ear plugs, surveys for buried and overhead utilities, limiting access to work area, protective clothing and footware, ambient air monitoring.	Modified_ Level_D	Level C or evacuation depending on concentration (See Table 8.1)

TETRA TECH, INC.
HEALTH AND SAFETY MANUAL
VOLUME III

SAFE WORK PRACTICES (SWP)

SAFE DRILLING PRACTICES

SWP NO.: 6-3

ISSUE DATE: JULY 1998

REVISION NO.: 1

Disclaimer: This safe work practice (SWP) is the property of Tetra Tech, Inc. (Tetra Tech), and its subsidiaries. Any reuse of the SWP without Tetra Tech's permission is at the sole risk of the user. The user will hold harmless Tetra Tech for any damages that result from unauthorized reuse of this SWP. Authorized users are responsible for obtaining proper training and qualification from their employer before performing operations described in this SWP.

SAFE DRILLING PRACTICES

This document establishes safe work practices (SWP) to follow during drilling operations. These SWPs are based on suggested safety procedures provided in the National Drilling Association's "Drilling Safety Guide." Procedures to follow before, during, and after drilling are listed below.

Before beginning any drill operation, each employee must be aware of the following:

- Wear a hard hat, safety glasses or goggles, steel-toed work boots, a shirt and full-length pants when working with or near the drill rig. Shirts must be tucked in at the belt.
- Do not wear loose or frayed clothing, loose long hair, or loose jewelry while working with rotating equipment.
- Do not eat, drink, or smoke near the drill rig.
- Identify all underground utility and buried structure locations before drilling.
- Ensure that the drill rig and any other machinery used is inspected daily by competent, qualified individuals. The site safety coordinator (SSC) will ensure compliance with this precaution.
- Drill rig operators will be instructed to report any abnormalities, such as equipment failure, oozing liquids, and unusual odors, to their supervisors or the SSC.
- Establish hand-signal communications for use when verbal communication is difficult. One person per work team will be designated to give hand signals to equipment operators.

While the drill rig is operating, employees should be aware of the following:

- Wear appropriate respiratory and personal protective equipment (PPE) when conditions warrant their use.
- Avoid direct contact with known or suspected contaminated surfaces.
- Move tools, materials, cords, hoses, and debris to prevent tripping hazards and contact with moving drill rig parts.
- Adequately secure tools, materials, and equipment subject to displacement or falling.
- Store flammable materials away from ignition sources and in approved containers.

Disclaimer: This safe work practice (SWP) is the property of Tetra Tech, Inc. (Tetra Tech), and its subsidiaries. Any reuse of the SWP without Tetra Tech's permission is at the sole risk of the user. The user will hold harmless Tetra Tech for any damages that result from unauthorized reuse of this SWP. Authorized users are responsible for obtaining proper training and qualification from their employer before performing operations described in this SWP.

- Maintain adequate clearance of the drill rig and mast from overhead transmission lines. The minimum clearance is 25 feet unless special permission is granted by the utility company. Call the local utility company for proper clearance.
- Only qualified and licensed personnel should operate drill rigs.
- Workers should not assume that the drill rig operator is keeping track of their exact location. Workers should never walk directly behind or beside heavy equipment without the operator's knowledge.
- Workers should maintain visual contact with drill rig operators at all times.
- When an operator must maneuver equipment in tight quarters, the presence of a second person is required to ensure adequate clearance. If much backing is required, two ground guides will be used: one in the direction the equipment is moving, and the other in the operator's normal field of vision to relay signals.
- Auger sections and other equipment are extremely heavy. All lifting precautions should be taken before moving heavy equipment. Appropriate equipment, such as chains, hoists, straps, and other equipment, should be used to safely transport heavy equipment too heavy to safely lift.
- Proper personal lifting techniques will be used. Workers should lift using their legs, not their backs.
- Workers will not use equipment they are not familiar with. This precaution applies to heavy as well as light equipment.
- All personnel not essential to work activities will be kept out of the work area.
- Workers will be aware of their footing at all times.
- Workers will remain alert at all times.

After drilling operations are completed, employees should do the following:

- Shut down machinery before repairing or lubricating parts (except parts that must be in motion for lubrication).
- Shut down mechanical equipment prior to and during fueling operations. When refueling or transferring fuel, containers and equipment must be bonded to prevent the buildup of static electricity.
- Keep drill rigs in the exclusion zone until work has been completed. Such equipment should then be decontaminated within the designated decontamination area.

Disclaimer: This safe work practice (SWP) is the property of Tetra Tech, Inc. (Tetra Tech), and its subsidiaries. Any reuse of the SWP without Tetra Tech's permission is at the sole risk of the user. The user will hold harmless Tetra Tech for any damages that result from unauthorized reuse of this SWP. Authorized users are responsible for obtaining proper training and qualification from their employer before performing operations described in this SWP.

TABLE 2

SUGGESTED GUIDELINES WHEN WEARING PPE

Ambient Temperature	Maximum PPE Wearing Time per Excursion
Above 90 °F	15 minutes
85 to 90 °F	30 minutes
80 to 85 °F	60 minutes
70 to 80 °F	90 minutes
60 to 70 °F	120 minutes
50 to 60 °F	180 minutes

Source: National Institute for Occupational Safety and Health (NIOSH). 1985. Memorandum Regarding Recommended Personal Protective Equipment Wearing Times at Different Temperatures. From Austin Henschel. To Sheldon Rabinovitz. June 20.

Disclaimer: This safe work practice (SWP) is the property of Tetra Tech, Inc. (Tetra Tech), and its subsidiaries. Any reuse of the SWP without Tetra Tech's permission is at the sole risk of the user. The user will hold harmless Tetra Tech for any damages that result from unauthorized reuse of this SWP. Authorized users are responsible for obtaining proper training and qualification from their employer before performing operations described in this SWP.

To monitor the level of an employee's heat stress, the following should be measured:

- Heart Rate: Count the radial (wrist) pulse during a 30-second period as early as possible in the rest period; if heart rate exceeds 110 beats per minute at the beginning of the rest period, shorten the next work cycle by one-third and keep the rest period the same.

  If the heart rate still exceeds 110 beats per minute at the next period, shorten the following work cycle by one-third.

- Oral Temperature: Use a clinical thermometer (3 minutes under the tongue) to measure the oral temperature at the end of the work period. If oral temperature exceeds 99.6 °F (37.6 °C), shorten the next work cycle by one-third without changing the rest period. If oral temperature still exceeds 99.6 °F at the beginning of the next rest period, shorten the following work cycle by one-third. Do not permit a worker to wear impermeable PPE when his or her oral temperature exceeds 100.6 °F (38.1 °C).

Disclaimer: This safe work practice (SWP) is the property of Tetra Tech, Inc. (Tetra Tech), and its subsidiaries. Any reuse of the SWP without Tetra Tech's permission is at the sole risk of the user. The user will hold harmless Tetra Tech for any damages that result from unauthorized reuse of this SWP. Authorized users are responsible for obtaining proper training and qualification from their employer before performing operations described in this SWP.

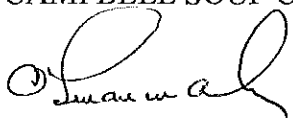
Financial Assurance for Facility Closure – Additional Documents

Gentlemen:

This is a follow-up to our letter dated July 18, 2002, which contained a Standby Trust Agreement for Closure and for Post Closure Care of the Facility. Enclosed please find the remainder of financial assurance documents consisting of:

1. Irrevocable Standby Letter of Credit No. P-226893 for closure or post closure care.



2. Standby Trust Agreement for Bodily Injury and Property Damage.

3. Irrevocable Standby Letter of Credit No. P-226892 for the Bodily Injury and Property Damage.

Please give me a call at (856) 968-4423 if you need any additional information.

Sincerely,

CAMPBELL SOUP COMPANY

IRREVOCABLE STANDBY LETTER OF CREDIT

CHRISTOPHER JONES, DIRECTOR
OHIO ENVIRONMENTAL PROTECTION AGENCY

DEAR SIR OR MADAM:

WE HEREBY ESTABLISH OUR IRREVOCABLE STANDBY LETTER OF CREDIT NO. P-226893 IN THE FAVOR OF JPMORGAN CHASE BANK, AS TRUSTEE PURSUANT TO THAT CERTAIN STANDBY TRUST AGREEMENT ENTERED INTO AS OF JULY 15, 2002, BY AND BETWEEN JPMORGAN CHASE BANK AND CAMPBELL SOUP COMPANY, AT THE REQUEST AND FOR THE ACCOUNT OF CAMPBELL SOUP COMPANY FOR THIRD-PARTY LIABILITY AWARDS OR SETTLEMENTS UP TO ONE MILLION U.S. DOLLARS (USD1,000,000) PER OCCURRENCE AND THE ANNUAL AGGREGATE AMOUNT OF TWO MILLION U.S. DOLLARS (USD2,000,000), FOR SUDDEN ACCIDENTAL OCCURRENCES AVAILABLE UPON PRESENTATION OF A SIGHT DRAFT, BEARING REFERENCE TO THIS LETTER OF CREDIT NO. P-226893.

THIS LETTER OF CREDIT IS EFFECTIVE AS OF JULY 15, 2002 AND WILL EXPIRE ON JULY 15, 2003, BUT SUCH EXPIRATION DATE WILL BE AUTOMATICALLY EXTENDED FOR A PERIOD OF AT LEAST ONE YEAR ON JULY 15, 2003 AND ON EACH SUCCESSIVE EXPIRATION DATE, UNLESS, AT LEAST ONE HUNDRED TWENTY DAYS BEFORE THE CURRENT EXPIRATION DATE, WE NOTIFY YOU, THE DIRECTOR AND CAMPBELL SOUP COMPANY BY CERTIFIED MAIL OR COURIER THAT WE HAVE DECIDED NOT TO EXTEND THIS LETTER OF CREDIT BEYOND THE CURRENT EXPIRATION DATE.

WHENEVER THIS LETTER OF CREDIT IS DRAWN ON, UNDER AND IN COMPLIANCE WITH THE TERMS OF THIS CREDIT, WE WILL DULY HONOR SUCH DRAFT UPON PRESENTATION TO US.

WE CERTIFY THAT THE WORDING OF THIS LETTER OF CREDIT IS IDENTICAL TO THE WORDING SPECIFIED IN PARAGRAPH (K) OF RULE 3745-55-51 OF THE ADMINISTRATIVE CODE AS SUCH REGULATIONS WERE CONSTITUTED ON THE DATE

Authorized Signature

Standby Trust Agreement

Standby Trust Agreement (the "Agreement") entered into as of July 15, 2002 by and between Campbell Soup Company, a New Jersey corporation (the "Grantor"), and JPMorgan Chase Bank, a national bank (the "Trustee").

Whereas, the Ohio Environmental Protection Agency (the "Ohio EPA") has established certain regulations applicable to the Grantor, requiring that an owner or operator of a hazardous waste management facility or group of facilities shall demonstrate financial responsibility for bodily injury and property damage to third parties caused by sudden and/or nonsudden accidental occurrences arising from operations of the facility or group of facilities.

Whereas, the Grantor has elected to establish a standby trust into which the proceeds from a letter of credit may be deposited to assure all or part of such financial responsibility for the facilities identified herein.

Whereas, the Grantor, acting through its duly authorized officers, has selected the Trustee to be the trustee under this Agreement, and the Trustee is willing to act as trustee.

Now, therefore, the Grantor and the Trustee agree as follows:

Section 1. Definitions. As used in this Agreement:

(a) The term "Grantor" means the owner or operator who enters into this Agreement and any successors or assigns of the Grantor.

(b) The term "Trustee" means the Trustee who enters into this Agreement and any successor Trustee.

Section 2. Identification of Facilities. This Agreement pertains to the facilities identified on attached schedule A.

Section 3. Establishment of Fund. The Grantor and the Trustee hereby establish a standby trust fund (hereafter the "Fund") for the benefit of any and all third parties injured or damaged by sudden accidental occurrences arising from operation of the facility(ies) covered by this guarantee, in the amount of up to $1 million per occurrence and up to $2 million annual aggregate for sudden accidental occurrences, except that the Fund is not established for the benefit of third parties for the following:

(a) Bodily injury or property damage for which Campbell Soup Company is obligated to pay damages by reason of the assumption of liability in a contract or agreement. This exclusion does not apply to liability for damages that Campbell Soup Company would be obligated to pay in the absence of the contract or agreement.

(b) Any obligation of Campbell Soup Company under a workers' compensation, disability benefits, or unemployment compensation law or any similar law.

(c) Bodily injury to:

(1) An employee of Campbell Soup Company arising from, and in the course of, employment by Campbell Soup Company; or

(2) The spouse, child, parent, brother, or sister of that employee as a consequence of or arising from, and in the course of employment by Campbell Soup Company. This exclusion applies:

(a) Whether Campbell Soup Company may be liable as an employer or in any other capacity; and

(b) To any obligation to share damages with or repay another person who must pay damages because of the injury to persons identified in paragraphs (1) and (2).

(d) Bodily injury or property damage arising out of the ownership, maintenance, use, or entrustment to others of any aircraft, motor vehicle, or watercraft.

(e) Property damage to:

(1) Any property owned, rented, or occupied by Campbell Soup Company;

(2) Premises that are sold, given away or abandoned by Campbell Soup Company if the property damage arises out of any part of those premises;

(3) Property loaned to Campbell Soup Company;

(4) Personal property in the care, custody or control of Campbell Soup Company;

(5) That particular part of real property on which Campbell Soup Company or any contractors or subcontractors working directly or indirectly on behalf of Campbell Soup Company are performing operations, if the property damage arises out of these operations.

In the event of combination with another mechanism for liability coverage, the fund shall be considered primary coverage.

The Fund is established initially as consisting of the proceeds of the letter of credit deposited into the Fund. Such proceeds and any other property subsequently transferred to the Trustee is referred to as the Fund, together with all earnings and profits thereon, less any payments or distributions made by the Trustee pursuant to this Agreement. The Fund shall be held by the Trustee, in trust, as hereinafter provided. The Trustee shall not

be responsible nor shall it undertake any responsibility for the amount or adequacy of, nor any duty to collect from the Grantor, any payments necessary to discharge any liabilities of the Grantor established by Ohio EPA.

Section 4. Payment for Bodily Injury or Property Damage. The Trustee shall satisfy a third party liability claim by drawing on the letter of credit described in Schedule B and by making payments from the Fund only upon receipt of one of the following documents:

(a) Certification from the Grantor and the third party claimant(s) that the liability claim should be paid. The certification shall be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted:

Certification of Valid Claim

The undersigned, as parties [insert Grantor] and [insert name and address of third party claimant(s)], hereby certify that the claim of bodily injury and/or property damage caused by a sudden accidental occurrence arising from operating [Grantor's] hazardous waste treatment, storage, or disposal facility should be paid in the amount of $[____].

[Signature]_____

Grantor_____

[Signatures]_____

Claimant(s)_____

(b) A valid court order establishing a judgment against the Grantor for bodily injury or property damage caused by sudden or nonsudden accidental occurrences arising from the operation of the Grantor's facility or group of facilities.

Section 5. Payments Comprising the Fund. Payments made to the Trustee for the Fund shall consist of the proceeds from the letter of credit drawn upon by the Trustee in accordance with the requirements of paragraph (K) of rule 3745-55-51 of the Administrative Code and Section 4 of this Agreement.

Section 6. Trustee Management. The Trustee shall invest and reinvest the principal and income in accordance with general investment policies and guidelines which the Grantor may communicate in writing to the Trustee from time to time, subject, however, to the provisions of this Section. In investing, reinvesting, exchanging, selling and managing the Fund, the Trustee shall discharge his duties with respect to the trust fund solely in the interest of the beneficiary and with the care, skill, prudence, and diligence under the circumstances then prevailing which persons of prudence, acting in a like capacity and familiar with such matters, would use in the conduct of an enterprise of a like character and with like aims; except that:

(a) Securities or other obligations of the Grantor, or any other owner or operator of the facilities, or any of their affiliates as defined in the Investment Company Act of 1940, as amended, 15 U.S.C. 80a-2(a), shall not be acquired or held, unless they are securities or other obligations of the federal or a state government;

(b) The Trustee is authorized to invest the Fund in time or demand deposits of the Trustee, to the extent insured by an agency of the federal or a state government; and

(c) The Trustee is authorized to hold cash awaiting investment or distribution uninvested for a reasonable time and without liability for the payment of interest thereon.

Section 7. Commingling and Investment. The Trustee is expressly authorized in its discretion:

(a) To transfer from time to time any or all of the assets of the Fund to any common, commingled or collective trust fund created by the Trustee in which the Fund is eligible to participate, subject to all of the provisions thereof, to be commingled with the assets of other trusts participating therein; and

(b) To purchase shares in any investment company registered under the Investment Company Act of 1940, 15 U.S.C. 80a-1 et seq., including one which may be created, managed, underwritten, or to which investment advice is rendered or the shares of which are sold by the Trustee. The Trustee may vote such shares in its discretion.

Section 8. Express Powers of Trustee. Without in any way limiting the powers and discretions conferred upon the Trustee by the other provisions of this Agreement or by law, the Trustee is expressly authorized and empowered:

(a) To sell, exchange, convey, transfer or otherwise dispose of any property held by it, by public or private sale. No person dealing with the Trustee shall be bound to see to the application of the purchase money or to inquire into the validity or expediency of any such sale or other disposition;

(b) To make, execute, acknowledge and deliver any and all documents of transfer and conveyance and any and all other instruments that may be necessary or appropriate to carry out the powers herein granted;

(c) To register any securities held in the Fund in its own name or in the name of a nominee and to hold any security in bearer form or in book entry, or to combine certificates representing such securities with certificates of the same issue held by the Trustee in other fiduciary capacities, or to deposit or arrange for the deposit of such securities in a qualified central depositary even though, when so deposited, such securities may be merged and held in bulk in the name of the nominee of such depositary with other securities deposited therein by another person, or to deposit or arrange for the deposit of any securities issued by the United States government, or any agency or

instrumentality thereof, with a Federal Reserve bank, but the books and records of the Trustee shall at all times show that all such securities are part of the Fund;

(d) To deposit any cash in the Fund in interest-bearing accounts maintained or savings certificates issued by the Trustee, in its separate corporate capacity, or in any other banking institution affiliated with the Trustee, to the extent insured by an agency of the federal or state government; and

(e) To compromise or otherwise adjust all claims in favor of or against the Fund.

Section 9. Taxes and Expenses. All taxes of any kind that may be assessed or levied against or in respect of the Fund and all brokerage commissions incurred by the Fund shall be paid from the Fund. All other expenses incurred by the Trustee in connection with the administration of this Trust, including fees for legal services rendered to the Trustee, the compensation of the Trustee to the extent not paid directly by the Grantor, and all other proper charges and disbursements to the Trustee shall be paid from the Fund.

Section 10. Advice of Counsel. The Trustee may from time to time consult with counsel, who may be counsel to the Grantor, with respect to any question arising as to the construction of this Agreement or any action to be taken hereunder. The Trustee shall be fully protected, to the extent permitted by law, in acting upon the advice of counsel.

Section 11. Trustee Compensation. The Trustee shall be entitled to reasonable compensation for its services as agreed upon in writing from time to time with the Grantor. Such compensation shall initially be $3,000 per annum or any part thereof without proration for partial years.

Section 12. Successor Trustee. The Trustee may resign or the Grantor may replace the Trustee, but such resignation or replacement shall not be effective until the Grantor has appointed a successor Trustee and this successor accepts the appointment. The successor Trustee shall have the same powers and duties as those conferred upon the Trustee hereunder. Upon the successor Trustee's acceptance of the appointment, the Trustee shall assign, transfer and pay over to the successor Trustee the funds and properties then constituting the Fund. If for any reason the Grantor cannot or does not act in the event of the resignation of the Trustee, the Trustee may apply to a court of competent jurisdiction for the appointment of a successor Trustee or for instructions. The successor Trustee shall specify the date on which it assumes administration of the trust in a writing sent to the Grantor, the director, and the present Trustee by certified mail ten days before such change becomes effective. Any expenses incurred by the Trustee as a result of any of the acts contemplated by this Section shall be paid as provided in Section 9.

Section 13. Instructions to the Trustee. All orders, requests, certifications of valid claims, and instructions to the Trustee shall be in writing, signed by such persons as are designated in the attached Exhibit A or such other designees as the Grantor may designate by amendment to Exhibit A. The Trustee shall be fully protected in acting

without inquiry in accordance with the Grantor's orders, requests and instructions. The Trustee shall have the right to assume, in the absence of written notice to the contrary, that no event constituting a change or a termination of the authority of any person to act on behalf of the Grantor or the director hereunder has occurred. The Trustee shall have no duty to act in the absence of such orders, requests and instructions from the Grantor and/or the director except as provided for herein.

Section 14. Amendment of Agreement. This Agreement may be amended by an instrument in writing executed by the Grantor, the Trustee, and the director, or by the Trustee and the director if the Grantor ceases to exist.

Section 15. Irrevocability and Termination. Subject to the right of the parties to amend this Agreement as provided in Section 14, this Trust shall be irrevocable and shall continue until terminated at the written agreement of the Grantor, the Trustee, and the director or by the Trustee and the director if the Grantor ceases to exist. Upon termination of the Trust, all remaining trust property, less final trust administration expenses, shall be delivered to the Grantor. The director will agree to termination of the Trust when the owner or operator substitutes alternative financial assurance as specified in this section.

Section 16. Immunity and Indemnification. The Trustee shall not incur personal liability of any nature in connection with any act or omission, made in good faith, in the administration of this Trust, or in carrying out any directions by the Grantor and the director issued in accordance with this Agreement. The Trustee shall be indemnified and saved harmless by the Grantor or from the Trust Fund, or both, from and against any personal liability to which the Trustee may be subjected by reason of any act or conduct in its official capacity, including all expenses reasonably incurred in its defense in the event the Grantor fails to provide such defense. Anything in this Agreement to the contrary notwithstanding, in no event shall the Trustee be liable for special, indirect or consequential loss or damage of any kind whatsoever (including but not limited to lost profits), even if the Trustee has been advised of the likelihood of such loss or damage and regardless of the form of action.

Section 17. Choice of Law. This Agreement shall be administered, construed, and enforced according to the laws of the State of Ohio.

Section 18. Interpretation. As used in this Agreement, words in the singular include the plural and words in the plural include the singular. The descriptive headings for each section of this Agreement shall not affect the interpretation or the legal efficacy of this Agreement.

In witness whereof the parties have caused this Agreement to be executed by their respective officers duly authorized and their corporate seals to be hereunto affixed and attested as of the date first above written.

Re: **Revised Closure Plan Approval**
Campbell Soup Company
USEPA/OEPA ID# OHD005419171

Dear Dr. Aly:

On October 31, 2001, GeoTrans Inc., on behalf of Campbell Soup Company (Campbell) submitted to Ohio EPA a closure plan entitled RCRA Site Closure Plan, Former Holding Pit Unit for a sludge pit unit formerly operated on the property. The facility is located at 1273 State Route 110, Napoleon, Ohio 43545. Revisions to the closure plan were received May 28, 2002, and July 15, 2002. The closure plan was submitted pursuant to the revised Director's Final Findings and Orders issued August 22, 2001, and Ohio Administrative Code (OAC) 3745-66-12 in order to demonstrate that Campbell's proposal for closure complies with the requirements of rules OAC 3745-66-11 and 3745-66-12.

The owner and the public were given the opportunity to submit written comments regarding the closure plan in accordance with the hazardous waste rule requirements. The public comment period extended from November 21, 2001, through December 20, 2001. No public comments were received by Ohio EPA.

Based upon review of Campbell's submittal and subsequent revisions, I conclude that the amended closure plan for the hazardous waste facility at 1273 State Route 110, Napoleon, Ohio 43545, as modified herein, meets the performance standard contained in OAC rule 3745-66-11 and complies with the pertinent parts of OAC rule 3745-66-12.

The amended closure plan originally submitted to Ohio EPA on October 31, 2001, and revised on May 28, 2002, and July 15, 2002, by Campbell is hereby approved with the following modifications:

I certify that this is a true and accurate copy of the official document as filed in the records of the Ohio Environmental Protection Agency.

Printed on Recycled Paper

Approval with Modifications to Revised Closure Plan
Campbell Soup Company

Ohio EPA has determined that several site characterization activities must be performed by the facility to meet the general closure standards for hazardous waste facilities and the specific standards for the closure of surface impoundments. These activities must be completed as part of the closure period. Site investigation results will determine whether additional closure activities are needed or whether closure certification can be completed. The nature and extent of post-closure monitoring will also be directed by the results from sampling activities outlined in Section 14.4.

General Modifications to the May 28, 2002, Revised Closure Plan

1 No excavation activities as outlined in this plan shall be undertaken until any and all authorizations necessary to perform the actions contained herein are obtained from Ohio EPA. This includes any permits necessary pursuant to compliance with OAC rules 3745-31-02 and 3745-35-02. Copies of such authorization(s) shall be received by the Division of Hazardous Waste, NWDO prior to beginning any excavation.

2 Campbell shall follow standard industry protocols while investigating the potential for impact to shallow ground water including those activities outlined in Section 14.1. Data that demonstrates appropriate well construction, boring, development, and sampling logs as well as all other pertinent monitoring well information and ground water analytical results shall be generated and compiled during this investigation for submission to Ohio EPA. Standards for such activities can be found in the Ohio EPA guidance document entitle *Technical Guidance Manual for Hydrogeologic Investigations and Ground Water Monitoring* dated February 1995.

3 If analysis of water samples obtained from the ground water investigation show the shallow ground water has been impacted, within 30 days of receipt of the analytical results, Campbell shall submit an amended closure plan which includes a revised schedule for closure and details the measures to be undertaken to delineate and remediate the areas of contamination.

4 If Campbell is not able to demonstrate clean closure of the contaminated area at the time of submission of the certification report, Campbell shall either excavate and dispose of all contaminated material off-site or submit an amended closure plan which details the measures necessary to close as a surface impoundment in accordance with OAC rule 3745-67-28. Should the latter alternative be chosen, Campbell shall submit a closure/post-closure care plan pursuant to OAC rules 3745-66-10 through 3745-66-20 and 3745-68-10.

Specific Modifications to the May 28, 2002, Revised Closure Plan

5 Section 8, Schedule for Closure. The revised closure plan is hereby modified to state that Campbell will complete and submit a site health and safety plan to Ohio EPA, NWDO within 30 days of receipt of a notice of approval by Ohio EPA of the closure plan.

6 Section 8, Schedule for Closure. The revised closure plan is hereby modified to state all information generated during the shallow ground water investigation shall be submitted to Ohio EPA, NWDO within 30 days of the installation of the last monitoring well.

7 Section 8, Schedule for Closure. The revised closure plan is hereby modified to state Campbell will receive the results of closure verification sampling within 180 days of receipt of a notice of approval by Ohio EPA of the closure plan.

8 Section 8, Schedule for Closure. The revised closure plan is hereby modified to state Campbell will conduct the engineer inspection and certification of site closure within 180 days of receipt of a notice of approval by Ohio EPA of the closure plan.

9 Section 11, Decontamination Efforts. For sampling and analysis involving waste delineation and confirmation, Campbell shall collect field blanks at a frequency of 10% of the total number of samples sent to the laboratory at a minimum of one field blank per day. Field blanks shall consist of analyte-free water poured over decontaminated sample collection equipment. They shall be analyzed for each analysis requested for the soil samples being sent to the laboratory for that particular day of sample collection.

10 Section 14.4, Waste Characterization Sampling Plan. The revised closure plan is hereby modified to state material analyzed for the presence of hazardous waste characteristics as required by OAC rule 3745-52-11 shall utilize the Toxicity Characteristic Leaching Procedure (TCLP) extraction method. These samples shall be analyzed for the presence of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and metals using standard SW-846 methods.

11 Section 14.4, Waste Characterization Sampling Plan. The revised closure plan is hereby modified to state copies of manifests and receipts will be sent to Ohio EPA, NWDO for any waste disposed off-site. Campbell shall provide Ohio EPA with an estimate of volume for all wastes treated on-site and disposed off-site as a result of closure activities.

12 Section 17.0, Certification. The revised closure plan is hereby modified to state Campbell shall include a topographic map depicting the ground surface elevations of the mound and natural grade with a scale no greater than 1 inch equals 30 feet and a contour interval no greater than 5 feet. It shall also include detailed descriptions and locations of the topographic features in the vicinity of the mound and at Campbell's plant which may affect conditions at the mound (i.e., buildings, rivers, ditches, etc...).

13 Section 17.0, Certification. The revised closure plan is hereby modified to state that Campbell shall include a separate appendix in the closure certification report which contains all the data generated during the ground water investigation. This may be incorporated by reference if this information has already been submitted in its entirety to Ohio EPA, NWDO in distinct form. Lab data generated as part of this investigation may be placed elsewhere within the report.

14 Table 3 in the revised closure plan which contains the maximum concentrations for the constituents of concern is hereby replaced by the table in Attachment A.

End of Modifications

Compliance with the approved closure plan, especially including the modifications specified herein, is expected. Ohio EPA will monitor such compliance. Ohio EPA expressly reserves the right to take action, pursuant to chapters 3734. and 6111. of the Ohio Revised Code, and other applicable law, to enforce such compliance and to seek appropriate remedies in the event of noncompliance with the provisions and modifications of this approved closure plan. Please be advised that approval of this closure plan does not release Campbell from any responsibilities regarding corrective action for all releases of hazardous waste or constituents from any waste management unit, regardless of the time at which waste was placed in the unit.

You are hereby notified that this action of the Director of Environmental Protection is final and may be appealed to the Environmental Review Appeals Commission pursuant to Ohio Revised Code section 3745.04. The appeal must be in writing and set forth the action complained of and the grounds upon which the appeal is based. The appeal must be filed with the commission within 30 days after notice of the director's action. Notice of the filing of the appeal shall be filed with the director within three days after the appeal is filed with the commission. An appeal may be filed with the commission at the following address:

Environmental Review Appeals Commission
236 East Town Street
Room 300
Columbus, Ohio 43215

When closure is completed, OAC rule 3745-66-15 requires the owner or operator of a facility to submit to the director of Ohio EPA, certification by the owner or operator and an independent, registered professional engineer, that the facility has been closed in accordance with the approved closure plan.

The certification by the owner or operator shall include the statement found in OAC rule 3745-50-42(D). These certifications should be submitted to:

Ohio Environmental Protection Agency
Division of Hazardous Waste Management
Attn: Pamela Allen, Information Technologies and Technical Support Section
P.O. Box 1049, Columbus, Ohio 43216-1049

Ohio EPA, Division of Hazardous Waste Management, strongly encourages you to consider pollution prevention options for any processes at your facility that generate waste. While implementation of pollution prevention options is not required by Ohio laws and regulations, the application of waste minimization practices may help reduce the expense of remedial activities. Additionally, implementation of pollution prevention options may prevent the creation of new units and, as a result, eliminate the requirement to submit a closure plan in the future. For assistance in identifying and implementing pollution prevention options, contact Colleen Weaver at (419) 373-3059.

Sincerely,

Christopher Jones

RE: Amendments to Director's Final Finding and Orders, October 18, 2000
Campbell Soup Supply Company, L.L.C.
Campbell Soup Company
Financial Assurance for Facility Closure

Gentlemen:

Enclosed please find a Standby Trust Agreement and a Standby Letter of Credit No. P-226893 established by J. P. Morgan Chase Bank to demonstrate the establishment of financial assurance and liability coverage for closure of the former Pit areas in accordance with OAC rules 3745-55-42/3745-66-42 through 3745-55-47/3745-66-47.

The financial assurance was established in compliance with Section v.b. of the Orders.

Sincerely,

CAMPBELL SOUP COMPANY

Standby Trust Agreement

Standby Trust Agreement (the "Agreement") entered into as of July 15, 2002 by and between Campbell Soup Company, a New Jersey corporation (the "Grantor"), and JPMorgan Chase Bank, a national bank (the "Trustee").

Whereas, the Ohio Environmental Protection Agency (the "Ohio EPA") has established certain rules applicable to the Grantor, requiring that the owner or operator of a hazardous waste management facility shall provide assurance that funds will be available when needed for closure and/or post-closure care of the facility,

Whereas, the Grantor has elected to provide the Ohio EPA with an irrevocable Standby Letter of Credit (the "LOC") to provide for such financial assurance for the facilities identified herein,

Whereas, the LOC provides that any funds paid pursuant to it shall be deposited into a trust to further provide such financial assurance.

Whereas, the Grantor, acting through its duly authorized officers, has selected the Trustee to be the trustee under this Agreement, and the Trustee is willing to act as trustee,

Now, therefore, the Grantor and the Trustee agree as follows:

Section 1. Definitions. As used in this Agreement:

(a) The term "Grantor" means the owner or operator who enters into this Agreement and any successors or assigns of the Grantor.

(b) The term "Trustee" means the Trustee who enters into this Agreement and any successor Trustee.

(c) The term "Director" means the Director of the Ohio EPA, or his designee.

Section 2. Identification of Facilities and Cost Estimates. This Agreement pertains to the facilities and cost estimates identified on attached Schedule A.

Section 3. Establishment of Fund. The Grantor and the Trustee hereby establish a trust fund (the "Fund") for the benefit of the Ohio EPA. The Grantor and the Trustee intend that no third party have access to the Fund except as herein provided. The Fund is established initially as consisting of any funds payable pursuant to, and in accordance with, the LOC, which is acceptable to the Trustee. Such property and any other property subsequently transferred to the Trustee is referred to as the Fund, together with all earnings and profits thereon, less any payments or distributions made by the Trustee pursuant to this Agreement. The Fund will be held by the Trustee, in trust, as hereinafter provided. The Trustee shall not be responsible nor shall it undertake any responsibility

for the amount or adequacy of, nor any duty to collect from the Grantor, any payments necessary to discharge any liabilities of the Grantor established by the Ohio EPA.

Section 4. Payment for Closure and Post-Closure Care. In the event of a deposit of funds into the trust from the LOC or otherwise, the Trustee will make such payments from the Fund as the Director will direct, in writing, to provide for the payment of the costs of closure and/or post-closure care of the facilities covered by this Agreement. The Trustee will reimburse the Grantor or other persons as specified by the Director from the Fund for closure and post-closure expenditures in such amounts as the Director will direct, in writing. In addition, the Trustee will refund to the Grantor such amounts as the Director specifies in writing. Upon refund, such funds will no longer constitute part of the Fund as defined herein.

Section 5. Payments Comprising the Fund. Payments made to the Trustee for the Fund will consist of cash or securities acceptable to the Trustee.

Section 6. Trustee Management. The Trustee will invest and reinvest the principal and income of the Fund and keep the Fund invested as a single fund, without distinction between principal and income, in accordance with general investment policies and guidelines which the Grantor may communicate in writing to the Trustee from time to time, subject, however, to the provisions of this Section. In investing, reinvesting, exchanging, selling and managing the Fund, the Trustee will discharge his duties with respect to the trust fund solely in the interest of the beneficiary and with the care, skill, prudence, and diligence under the circumstances then prevailing which persons of prudence, acting in a like capacity and familiar with such matters, would use in the conduct of an enterprise of a like character and with like aims; except that:

(a) Securities or other obligations of the Grantor, or any other owner or operator of the facilities, or any of their affiliates as defined in the Investment Company Act of 1940, as amended, 15 USC # 80a-2(a), will not be acquired or held, unless they are securities or other obligations of the Federal or a State government;

(b) The Trustee is authorized to invest the Fund in time or demand deposits of the Trustee, to the extent insured by an agency of the Federal or State government; and

(c) The Trustee is authorized to hold cash awaiting investment or distribution uninvested for a reasonable time and without liability for the payment of interest thereon.

Section 7. Commingling and Investment. The Trustee is expressly authorized in its discretion:

(a) To transfer from time to time any or all of the assets of the Fund to any common, commingled or collective trust fund created by the Trustee in which the Fund is eligible to participate, subject to all of the provisions thereof, to be commingled with the assets of other trusts participating therein; and

(b) To purchase shares in any investment company registered under the Investment Company Act of 1940, 15 U.S.C. # 80a-1 et seq., including one which may be created, managed, underwritten, or to which investment advice is rendered or the shares of which are sold by the Trustee. The Trustee may vote such shares in its discretion.

Section 8. Express Powers of Trustee. Without in any way limiting the powers and discretions conferred upon the Trustee by the other provisions of this Agreement or by law, the Trustee is expressly authorized and empowered:

(a) To sell, exchange, convey, transfer or otherwise dispose of any property held by it, by public or private sale. No person dealing with the Trustee will be bound to see to the application of the purchase money or to inquire into the validity or expediency of any such sale or other disposition;

(b) To make, execute, acknowledge and deliver any and all documents of transfer and conveyance and any and all other instruments that may be necessary or appropriate to carry out the powers herein granted;

(c) To register any securities held in the Fund in its own name or in the name of a nominee and to hold any security in bearer form or in book entry, or to combine certificates representing such securities with certificates of the same issue held by the Trustee in other fiduciary capacities, or to deposit or arrange for the deposit of such securities in a qualified central depositary even though, when so deposited, such securities may be merged and held in bulk in the name of the nominee of such depositary with other securities deposited therein by another person, or to deposit or arrange for the deposit of any securities issued by the United States Government, or any agency or instrumentality thereof, with a Federal Reserve bank, but the books and records of the Trustee will at all times show that all such securities are part of the Fund;

(d) To deposit any cash in the Fund in interest-bearing accounts maintained or savings certificates issued by the Trustee, in its separate corporate capacity, or in any other banking institution affiliated with the Trustee, to the extent insured by an agency of the Federal or State government; and

(e) To compromise or otherwise adjust all claims in favor of or against the Fund.

Section 9. Taxes and Expenses. All taxes of any kind that may be assessed or levied against or in respect of the Fund and all brokerage commissions incurred by the Fund will be paid from the Fund. All other expenses incurred by the Trustee in connection with the administration of this Trust, including fees for legal services rendered to the Trustee, the compensation of the Trustee to the extent not paid directly by the Grantor, and all other proper charges and disbursements of the Trustee will be paid from the Fund.
Section 10. Annual Valuation. In the event of a deposit of funds into the trust from the LOC or otherwise, the Trustee will annually, at least thirty days prior to the anniversary date of such deposit furnish to the Grantor and to the Director a statement confirming the value of the Trust. Any securities in the Fund will be valued at market value as of no

more than sixty days prior to the anniversary date of establishment of the Fund. The failure of the Grantor to object in writing to the Trustee within ninety days after the statement has been furnished to the Grantor and the Director will constitute a conclusively binding assent by the Grantor, barring the Grantor from asserting any claim or liability against the Trustee with respect to matters disclosed in the statement.

Section 11. Advice of Counsel. The Trustee may from time to time consult with counsel, who may be counsel to the Grantor, with respect to any question arising as to the construction of this Agreement or any action to be taken hereunder. The Trustee will be fully protected, to the extent permitted by law, in acting upon the advice of counsel.

Section 12. Trustee Compensation. The Trustee will be entitled to reasonable compensation for its services as agreed upon in writing from time to time with the Grantor. Such compensation shall initially be $3,000 per annum or any part thereof without proration for partial years.

Section 13. Successor Trustee. The Trustee may resign or the Grantor may replace the Trustee, but such resignation or replacement shall not be effective until the Grantor has appointed a successor Trustee and this successor accepts the appointment. The successor Trustee will have the same powers and duties as those conferred upon the Trustee hereunder. Upon the successor Trustee's acceptance of the appointment, the Trustee will assign, transfer and pay over to the successor Trustee the funds and properties then constituting the Fund. If for any reason the Grantor cannot or does not act in the event of the resignation of the Trustee, the Trustee may apply to a court of competent jurisdiction for the appointment of a successor trustee or for instructions. The successor Trustee shall specify the date on which it assumes administration of the trust in a writing sent to the Grantor, the Director, and the present Trustee by certified mail ten days before such change becomes effective. Any expenses incurred by the Trustee as a result of any of the acts contemplated by this Section will be paid as provided in Section 9.

Section 14. Instructions to the Trustee. All orders, requests and instructions by the Grantor to the Trustee will be in writing, signed by such persons as are designated in the attached Exhibit A or such other designees as the Grantor may designate by amendment to Exhibit A. The Trustee will be fully protected in acting without inquiry in accordance with the Grantor's orders, requests and instructions. All orders, requests, and instructions by the Director of the Ohio EPA or his designee to the Trustee will be in writing, signed by the Director of the Ohio EPA or his designee, and the Trustee will act and will be fully protected in acting in accordance with such orders, requests and instructions. The Trustee will have the right to assume, in the absence of written notice to the contrary, that no event constituting a change or a termination of the authority of any person to act on behalf of the Grantor or the Director hereunder has occurred. The Trustee will have no duty to act in the absence of such orders, requests and instructions from the Grantor and/or the Director except as provided for herein.

Section 15. Notice of Nonpayment. In the event of a deposit of funds into the trust from the LOC or otherwise, the Trustee will notify the Grantor and the Director, by certified

mail within ten days following the expiration of the thirty-day period after the anniversary of the establishment of the Trust, if no payment is received from the Grantor during that period. After the pay-in period is completed the Trustee is not required to send a notice of nonpayment.

Section 16. Amendment of Agreement. This Agreement may be amended by an instrument in writing executed by the Grantor, the Trustee, and the Director, or by the Trustee and the Director if the Grantor ceases to exist.

Section 17. Irrevocability and Termination. Subject to the right of the parties to amend this Agreement as provided in Section 16, this Trust will be irrevocable and will continue until terminated at the written agreement of the Grantor, the Trustee, and the Director or by the Trustee and the Director if the Grantor ceases to exist. Upon termination of the Trust, all remaining trust property, less final trust administration expenses, will be delivered to the Grantor.

Section 18. Immunity and Indemnification. The Trustee will not incur personal liability of any nature in connection with any act or omission, made in good faith, in the administration of this Trust, or in carrying out any directions by the Grantor or the Director issued in accordance with this Agreement. The Trustee will be indemnified and saved harmless by the Grantor or from the Trust Fund, or both, from and against any personal liability to which the Trustee may be subjected by reason of any act or conduct in its official capacity, including all expenses reasonably incurred in its defense in the event the Grantor fails to provide such defense. Anything in this Agreement to the contrary notwithstanding, in no event shall the Trustee be liable for special, indirect or consequential loss or damage of any kind whatsoever (including but not limited to lost profits), even if the Trustee has been advised of the likelihood of such loss or damage and regardless of the form of action.

Section 19. Choice of Law. This Agreement will be administered, construed and enforced according to the laws of the state of Ohio.

Section 20. Interpretation. As used in this Agreement, words in the singular include the plural and words in the plural include the singular. The descriptive headings for each Section of this Agreement will not affect the interpretation or the legal efficacy of this Agreement.

In witness whereof the parties have caused this Agreement to be executed by their respective officers duly authorized and their corporate seals to be hereunto affixed and attested as of the date first above written.

- ☐ Approved as submitted
- ☐ Approved as noted
- ☐ Returned for corrections
- ☐ Other

Upon review of the RCRA Site Closure Plan, Former Holding Pit, Campbell Soup Company, Napoleon Ohio dated May 24, 2002 we noticed minor errors on Figures 3C and Figure 6. Therefore we are re-issuing both figures with this transmittal. Figure 3C has been revised to remove the square symbols labeled 'SD' surrounding the mound. This symbols do not represent anything, and were in an ambiguous layer in AutoCAD. The numbering scheme for the proposed soil borings has been revised in Figure 6 to eliminate the duplication of PB-01-51. The proposed borings are now labeled PB-01-52 through PB-01-58.

INTER-OFFICE COMMUNICATION

TO: Christopher Jones, Director

FROM: James Moseley, DHWM, NWDO

SUBJECT: Campbell Soup Company - CLOSURE PLAN APPROVAL

DATE: July 7, 2002

Attached for your review and signature is a letter for closure plan approval for Campbell Soup Company located at 1273 State Route 110, Napoleon, Ohio 43545. The closure plan received on October 31, 2001, and last revised on May 28, 2002, addresses the closure requirements of the following hazardous waste unit:

Former Location of Sludge Holding Pit - This unit is situated on top of a mound created from various fill material. The ~~area was once the location of a~~ sludge holding pit ~~which~~ held spent coating materials and solvents that were used in can manufacturing. The sludge was combined with sand to reduce moisture and hauled off site for disposal. Though the unit was dismantled, residual wastes from the process remain in the subsurface soils. The closure plan was submitted in response to the revised Director's Final Findings and Orders (DFF&Os) issued August 22, 2001.

DHWM staff has reviewed the plan accordance with Ohio Administrative Code (OAC) rule(s) 3745-66-11 AND 3745-66-12 and the DFF&Os and has determined that the proposal complies with Ohio EPA hazardous waste rules.

The public comment period for the plan ended on December 20, 2001. No public comments were received concerning this closure plan by Ohio EPA. Therefore, a responsiveness summary is not included. The remainder of the administrative record is available for your review in DHWM's Information Technologies and Technical Support Section.

If you have any questions regarding the closure plan approval, please call James Moseley at 419-373-3015. In accordance with OAC rule 3745-66-12, Ohio EPA is required to issue an action on this plan by August 26, 2002.

1. SITE HISTORY

Prior to 1981, spent coating materials and solvents from the former can manufacturing operation were stored in 55-gallon drums and used as a boiler fuel supplement (Boiler and Industrial Furnace 'BIF' Small Quantity Exemption). Semi-solid residues from the solvent drums were placed in a temporary holding pit and mixed with sand to reduce the moisture content. The temporary holding pit was constructed of local clay serving as containment dikes and an impermeable liner for the pit. The holding pit was active from 1981 until 1983. Prior to demolition of the pit the dried material was excavated and transported to a landfill for disposal. After demolishing the clay dikes the former holding pit was covered with 4- to 5-feet of additional fill material.

From 1999 through 2001 subsurface investigations were conducted in the former holding pit area. The subsurface investigations verified the presence of volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) in the soils surrounding the former holding pit. Due to the presence of VOCs and SVOCs Campbell Soup entered into a Consent Order agreement with the Ohio EPA to implement a full RCRA Closure Plan for the former holding pit. The Closure Plan is intended to close and remediate the subject area.

A RCRA Site Closure Plan was submitted to the Ohio EPA on October 25, 2001. The Ohio EPA responded on April 23, 2001, and required re-submittal of the Closure Plan. The Closure Plan was revised and re-submitted to the Ohio EPA on May 24, 2002.

2. REQUEST FOR EXEMPTION

This report serves as a formal request to the Director of the Ohio EPA to grant a Discretionary Exemption per Ohio Administration Code (OAC) 3745-31-03 (3) (g). The following information is provided in support of this request:

- The Campbell Soup facility falls under the jurisdiction of the Northwest District Office (NWDO) of the Ohio EPA. While preparing the Closure Plan, the Air Quality Division of the NWDO was consulted about obtaining a permit to operate our proposed soil remediation system, utilizing a medium-temperature thermal desorption (MTTD) unit. We were told operation of the MTTD is exempt from a permit to install under OAC 3745-31-03 (4) (d). During the RCRA Closure Plan review, it was determined by the OEPA that this was not, in fact, an appropriate exemption under the referenced rule. This inaccurate information from the Ohio EPA caused Campbell Soup to lose valuable time in which a permit application could have been prepared and submitted.
- The MTTD is expected to be in operation for only 14-days, based on 12-hour days. The emissions from the MTTD will be a temporary single event.
- Campbell Soup has been proactive in addressing the contaminated soil problem to date. Campbell Soup is very interested in cleaning up the soil in a timely manner. Ideally the soil remediation would have occurred in May 2002, but the timeframes for OEPA reviews have been long, resulting in significant delays to this schedule. Campbell Soup is eager to remediate the soils this summer, and a delay to obtain a permit to install would prevent remediation during this calendar year.

The following sections contain additional evidence supporting this request.

3. PROPOSED SOIL REMEDIATION

Many options were evaluated for addressing the residual contaminants in the soil. Based on the site conditions, the available facilities at the plant, the relative cost of each option, the efficacy of each option, and future liabilities associated with each option, Campbell Soup is proposing to remediate the soils surrounding the former holding pit using medium-temperature thermal desorption (MTTD). This approach offers the following advantages:

- The former holding pit and its surrounding area consist of a mixture of cinders, sands, and clay. The clay rich nature of the contaminated area cannot support standard soil vapor extraction activities.
- The subsurface investigations have shown the extent of contamination to be irregular – mostly limited to more permeable cinder-filled soil layers in proximity to the pit. The MTTD will effectively treat all soils that are excavated.
- Long-term liabilities associated with leaving the contaminated soils in place or transferring them to another location will be reduced or eliminated.
- Long term monitoring requirements and/or permits will not be required.
- The approach focuses on destruction of the contaminants, rather than long-term containment or transfer to other media.
- The relative cost of implementation is less than the other approaches available for handling the proposed volumes of soil.
- Sufficient land and support facilities are available for an on-site MTTD operation.
- The MTTD approach provides the best protection against unknown future impacts to ecological systems or environmental pathways.

4. PROCESS DESCRIPTION

Soils slated for treatment will be loaded onto the conveyors and fed into the MTTD. Cohesive soils are passed through grinders and shredders that reduce the soil clumps to 2-inches in diameter or less. Soils enter a rotating kiln and are subjected to 550 deg. F. temperatures, sufficient to desorb all organic VOCs and SVOCs from the soil. Treated soils are quenched with water and cooled to 212 deg. F. before exiting the reactor. Treated and tested soil will be returned to the excavation as clean backfill.

Off-gasses from the treatment reactor are passed through a bag-house to recover fine particulates and then passed though a high temperature (1600 to 1750 deg. F.) afterburner to prevent discharge of contaminants to the air.

The MTTD remediation unit is designed to process up to 77 tons of soil per hour. However, based on the expected high moisture and clay content of the soils around the former holding pit, it is expected the MTTD will process between 30 and 40 tons of soil per hour at the Campbell Soup Napoleon site. It is estimated that 5,000 tons of soil will need to be treated after excavation. The MTTD will run a minimum of 12 hours/day, requiring use of the MTTD for 14 days.

5. REGULATORY APPLICABILITY

To process this request for an exemption from the requirement to obtain an installation permit, the NWDO conducted a review of state and federal regulations to identify applicable requirements for the proposed MTTD exemption from permitting. The following sections are intended to assist the Ohio EPA in determining if the cleanup operations meet all applicable air emission limits, rules, and policies.

An Emissions Test Report dated August 1992 was prepared by WW Engineering & Science, Inc., for the MTTD that is proposed for use at the Campbell Soup Napoleon site. Excerpts of the Emission Test Report can be found in Appendix A.

5.1 Fugitive Dust Management Plan

Per the best available technology (BAT) requirements all reasonably available control measures will be used to minimize or eliminate visible particulate emissions of particulate dust, such that the visible particulate emissions will not exceed 20% opacity as a three minute average, during the clean-up operations at this site. Fugitive dust could potentially be emitted during the following activities:

- Excavation of contaminated soils
- Truck loading and unloading of contaminated and treated soils
- Stock piling of clean and contaminated soils
- Loading and unloading of soil from the MTTD
- Re-filling the excavated area with clean soils

A water spray unit will be on-site during all cleanup operations. The periodic application of water will be used to suppress fugitive dust from the soil management activities. In addition, the MTTD is an entirely closed system. The soil enters and exits the MTTD on a conveyer belt. As the MTTD is a closed system, all particulate matter is directed to the baghouses. The 'clean' soil leaving the MTTD is at temperature in excess of 200 degrees Fahrenheit. To control the fugitive dust and re-hydrate MTTD desiccated soils, the soils are quenched with water prior to exiting the MTTD.

5.2 Particulate Emissions

The particulate emissions from the baghouse will not exceed 0.03 grains per dry standard cubic foot (DSCF) of exhaust flow. As shown in the Emissions Test Report the actual particulate emissions from the baghouse were 0.01 grains per DSCF, below the applicable standard of 0.03 grains per DSCF.

There will be no visible (0% opacity) particulate emissions from the baghouse. When the MTTD is running properly the only emissions from the baghouse are water vapor and residual particulate matter. If visible emissions are discharging from the baghouse the MTTD will be shut down.

OAC Rule 3745-17-11 (B) limits the mass flow rate of particulate emissions from the baghouse. Assuming a loading rate of 30 tons/hour the allowable rate of particulate emissions is 40.0 lbs/hour (Table II). Table 3.1 in the Emissions Test Report lists an average particulate emission rate of 0.7 lbs/hour using a loading rate of 22 tons/hour. Using the known data with the expected loading rate of 30 tons/hour we can predict the particulate emission rate will be 0.95 lbs/hr, well below the applicable particulate emission limitations of OAC Rule 3745-17-11(B).

5.3 Organic Compound Emissions

The controlled organic emissions from the afterburner will be less than one ton, exempting the MTTD from complying with the Ohio EPA air toxics policy. Based on an average organic soil concentration of 20,000 parts per billion (ppb), a destruction rate efficiency of 98.7% in the afterburner, and a daily run time for the MTTD of 12 hours the daily emission rate for organic compounds is 0.25 lbs/day.

A worst case scenario calculation was computed to ensure the organic emissions from the afterburner will be less than one ton. Forty-one (41) total VOCs and fifteen (15) total SVOCs were detected in the soils surrounding the holding pit. Using the highest detected concentration of the 41 VOCs and the 15 SVOCs the organic soil concentration would be 1,500,000 ppb. Assuming, very conservatively, that this concentration is uniform across the

site, the MTTD runs for 15 days at 40 tons/hour, and a destruction rate of 98.7% in the afterburner the total organic emissions would be 0.14 tons.

5.4 Generator and Sulfur Dioxide Emissions

Campbell Soup proposes to operate a 275 KW electric generator to supply energy to the proposed MTTD unit. The diesel fired generator can supply a maximum of 411 horsepower, with a maximum diesel heat input of approximately 2.84 million Btu/hour.

Maximum potential emissions of particulate matter (PM), carbon monoxide (CO), nitrogen oxides (NOx) and VOCs from the proposed generator were developed using manufacturer (CAT) performance testing data. Potential emissions of sulfur oxides, particulate matter less than 10 micorons (PM10) and diesel generated toxic air contaminants were developed using emission factors from US EPA's Factor Information Retrieval System (FIRE, Version 6.21) or US EPA's Compilation of Air Pollutant Emission Factors, AP-42, Section 3.3, "Gasoline and Diesel Industrial Engines", Table 3.3-1, USEPA, 10/1996. A copy of the manufacturer performance data and estimates of maximum potential emissions are presented in Calculation Sheet 1, found in Appendix B.

OAC Rule 3745-18-06 (G) limits emissions of sulfur dioxide from fuel fired sources in excess of 0.5 pounds per million Btu's of heat input. Emission estimates for sulfur dioxide from the proposed generator using diesel (No. 2 fuel oil) are estimated to be 0.84 lb/hr with a maximum heat input of approximately 2.84 million Btu heat input. This results in a value of 0.29 lb sulfur dioxide per million Btu heat input, which is below the applicable sulfur dioxide matter limitations of OAC Rule 3745-18-06 (G). Estimates of maximum potential sulfur dioxide emissions are presented in Calculation Sheet 1, found in Appendix B.

3.0 SUMMARY OF RESULTS

Results from the emissions testing are presented in Table Nos. 3.1 and 3.2. Table No. 3.1 presents emissions data in pounds per hour (lbs/hr) for each test conducted. Table No. 3.2 presents auxiliary results which includes gas flow rates in actual cubic feet per minute (acfm), standard cubic feet per minute (scfm), and dry standard cubic feet per minute (dscfm); gas temperature in degrees Fahrenheit (°F), moisture in percent (%), and gas composition of oxygen, carbon dioxide, and nitrogen.

The NO_X emission rate ranged from 1.3 to 2.1 lbs/hr and averaged 1.8 lbs/hr. The SO_2 emission rate ranged from 0.5 to 0.9 lbs/hr and averaged 0.7 lbs/hr. The VOC emission rate ranged from 0.3 to 0.8 lbs/hr as carbon and averaged 0.6 lbs/hr as carbon. The particulate emission rate ranged from 0.3 to 1.0 lbs/hr and averaged 0.7 lbs/hr.

The exhaust flow rates ranged from 34,619 to 36,347 acfm, averaging 35,708 acfm; from 9,887 to 10,485 scfm, averaging 10,241 scfm; and from 6,872 to 7,296 dscfm, averaging 7,085 dscfm. Exhaust-gas temperatures averaged 1,334°F. Exhaust-gas moisture averaged 30.7%. Exhaust-gas oxygen averaged 16.0%. Carbon dioxide averaged 4.9%.

Total Toxic air contaminants					9.64E-03

Diesel consumption rate is 20.9 gallons per hour per Reference 3.
Proposed Diesel Limitation of 21,067 gallons per year.

Assumptions:
1) SCC for diesel combustion is 20400402.
2) NOx, CO, VOC(HC), and particulate matter (PM) potential emissions for diesel based on generator manufacturer (CAT) testing data. Data based on operating at 100% load.
3) AP-42 TOC emission factors represents sum of the exhaust, evaporative, crankcase, and refueling emission factors from Reference 1).
4) Diesel Fuel has a density of 7.05 lb/gal.
5) Potential emissions estimated based on an operating schedule of twenty four (24) hrs/day, seven (7) days/week for six (6) weeks.
6) Diesel heat content of 19,300 Btu/lb per Reference 1).
7) Non-carcinogenic PAHs include: acenaphthene, acenaphthylene, anthracene, benzo(g,h,i)perylene, fluoranthene, fluorene, naphthalene, phanethrene & pyrene.
8) Carcinogenic PAHs include: benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, chrysene, dibenzo(a,h)anthracene & indeno(1,2,3-cd)pyrene.

Equations:
1) AP-42 Emission Factor (lb/gal) = AP-42 Emission Factor (lb/MMBtu) x [1 MMBtu/1,000,000 Btu] x [heat content (Btu/lb)] x [density (lb/gal)]
3) Diesel NOX, HC, CO and PM Potential Hourly Emissions (lb/hr) = CAT Testing Results (lb/hr)
4) Diesel SOx and PM-10 Uncontrolled Potential Hourly Emissions (lb/hr) = Emission Factor (lbs/gal) x Engine fuel consumption rate (gal/hr)
5) Diesel Potential Annual Emissions (ton/year) = Potential Hourly Emissions (lb/hr) x 24 hrs/day x 7 days/week x 6 weeks x 1 ton/2000 lb
6) Maximum Potential Emissions = Maximum of Gasoline or Diesel Potential Emissions
7) Maximum Annual Fuel Usage (gal/yr) = Engine fuel consumption rate (gal/hr) x 8,760 hr/yr x Maximum number of engines (11)

Respondents

Director's Final Findings and Orders

AMENDMENT TO DIRECTOR'S FINAL FINDINGS AND ORDERS OF OCTOBER 18, 2000

PREAMBLE

It is hereby agreed by and among the parties hereto as follows:

I. JURISDICTION

These Director's Final Findings and Orders (Orders) are issued to the Campbell Soup Company and Campbell Soup Supply Company L.L.C. (Respondents) pursuant to the authority vested in the director of the Ohio Environmental Protection Agency (Ohio EPA) under § 3734.13 and § 3745.01 of the Ohio Revised Code (ORC).

II. PARTIES BOUND

These Orders shall apply to and be binding upon the Respondents, their assigns and successors in interest. No changes in ownership relating to the Facility will in any way alter the Respondents' responsibilities under these Orders. The Respondents' obligations under these Orders may be altered only by the written approval of the director of Ohio EPA.

I certify this to be a true and accurate copy of the official document as filed in the records of the Ohio Environmental Protection Agency
By: _____ Date: 8-22-01

III. DEFINITIONS

1. Unless otherwise stated, all terms in these Orders shall have the same meaning as used in the Director's Final Findings and Orders of October 18, 2000, and as used in Chapter 3734. of the ORC and the regulations promulgated thereunder.

2. The effective date of these Orders is the date these Orders are entered into the Ohio EPA director's journal.

IV. FINDINGS OF FACT

The Director of Ohio EPA has determined the following findings of fact:

1. On October 18, 2000, the director issued Director's Final Findings and Orders to Respondents. All findings of fact made in the October 18, 2000, Director's Final Findings and Orders are hereby incorporated by reference.

2. The October 18, 2000 Director's Final Findings and Orders required Respondents to, *inter alia*, submit to Ohio EPA for review and approval a closure plan to close the Pits area at the Facility where hazardous waste was disposed of without a permit.

3. On November 2, 2000, Respondents submitted to Ohio EPA a closure plan as required by Order No. 1 of the October 18, 2000, Director's Final Findings and Orders.

4. By letter dated March 30, 2001, Respondents submitted to Ohio EPA a request to withdraw the closure plan due to technical deficiencies contained within the closure plan. Respondents also requested an extension of time in which to submit a revised closure plan correcting technical deficiencies. In support of the extension request, Respondents have committed to working closely with Ohio EPA to correct all of the technical deficiencies prior to resubmitting to Ohio EPA the closure plan.

V. ORDERS

The Respondents shall achieve compliance with Chapter 3734. of the ORC and the regulations promulgated thereunder according to the following compliance schedule:

1. The October 18, 2000 Director's Final Findings and Orders are amended as follows:

   a. Order No. 1 is superseded and replaced with the following new Order No. 1:

      Respondents shall close the Pits area at the Facility where hazardous waste was disposed of without a permit, in accordance with OAC rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20. Within 60 days after the effective date of these Orders, Respondents shall submit to Ohio EPA a closure plan, prepared in accordance with OAC rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20.

   b. Order No. 5 is superseded and replaced with the following new Order No. 5:

      Within 60 days after the effective date of these Orders, Respondents shall submit to Ohio EPA a closure cost estimate and documentation demonstrating that Respondents have established financial assurance and liability coverage for closure in accordance with OAC rules 3745-55-42/3745-66-42 through 3745-55-47/3745-66-47.

2. Except as noted in these Orders, all terms and conditions of the October 18, 2000 Director's Final Findings and Orders remain valid and in effect.

VI. TERMINATION

The Respondents' obligations under these Orders shall terminate when the Respondents demonstrate in writing and certify to the satisfaction of Ohio EPA that all obligations under these Orders have been performed and Ohio EPA's Division of Hazardous Waste Management acknowledges, in writing, Ohio EPA's acceptance of this demonstration and certification.

This certification shall be submitted by the Respondents and shall be signed by a responsible official of the Respondents. The certification shall make the following attestation: "I certify that the information contained in or accompanying this certification is true, accurate and complete."

For purposes of these Orders, a responsible official is a corporate officer who is in charge of a principal business function of the Respondents.

VII. OTHER CLAIMS

Nothing in these Orders shall constitute or be construed as a release from any claim, cause of action or demand in law or equity against any person, firm, partnership or corporation, not a signatory to these Orders, for any liability arising out of or relating to the operations of the Respondents' Facility.

VIII. OTHER APPLICABLE LAWS

All actions required to be taken pursuant to these Orders shall be undertaken in accordance with the requirements of all applicable local, state and federal laws and regulations. Nothing in these Orders shall be construed as waiving or compromising in any way the applicability and enforcement of any other statutes or regulations applicable to the Respondents' operation of the Facility. Ohio EPA reserves all rights and privileges except as specified herein. Respondents reserve all rights and defenses which may be available at law or in equity and under any statute, regulation or common law applicable to Respondents' operation of the Facility, except as specified herein.

IX. NOTICE

All documents demonstrating compliance with these Orders, and other documents required under these Orders to be submitted to Ohio EPA, shall be addressed to:

Ohio Environmental Protection Agency
Northwest District Office
Division of Hazardous Waste Management
Attn: DHWM Manager
347 North Dunbridge Road
Bowling Green, OH 43402

and Ohio EPA Central Office at the following address:

For mailings, use the post office box number:

or to such persons and addresses as may hereafter be otherwise specified in writing by Ohio EPA.

All documents to be submitted to Respondents under this Order shall be addressed to:

Dr. Osman Aly
Environmental Consultant
Campbell Soup Company
Campbell Place
Camden, New Jersey 08103

and

Faith R. Greenfield, Esq.
Campbell Soup Company
Campbell Place
Camden, New Jersey 08103

X. RESERVATION OF RIGHTS

Nothing contained herein shall be construed to prevent Ohio EPA from seeking legal or equitable relief to enforce the terms of these Orders or from taking administrative, legal or equitable action as deemed appropriate and necessary, including seeking penalties against the Respondents for noncompliance with these Orders. Nothing contained herein shall be construed to prevent Ohio EPA from exercising its lawful authority to require the Respondents to perform additional activities, including closure of additional hazardous waste management units at the Facility, pursuant to ORC Chapter 3734. or any other applicable law in the future. Nothing herein shall restrict the right of the Respondents to raise any administrative, legal or equitable claim or defense with respect to such further actions which Ohio EPA may seek to require of the Respondents. Nothing in these Orders shall be construed to limit the authority of Ohio EPA to seek relief for violations not addressed in these Orders.

XI. SIGNATORIES

Each undersigned representative of a signatory to these Orders certifies that he or she is fully authorized to enter into these Orders and to legally bind such signatory to this document.

IT IS SO ORDERED:

Christopher Jones
Director

AUG 2 2 2007
Date

XII. WAIVER

In order to resolve disputed claims, without admission of fact, violation or liability, and, subject to Section X of these Orders, in lieu of further enforcement action by Ohio EPA for only the violations addressed in these Orders, the Respondents agree that these Orders are lawful and reasonable, that the times provided for compliance herein are reasonable and that the Respondents agree to comply with these Orders. Subject to Section X., above, compliance with these Orders shall be a full accord and satisfaction for the Respondents' liability for the violations cited herein.

The Respondents hereby waive the right to appeal the issuance, terms and service of these Orders and hereby waive any and all rights they might have to seek administrative or judicial review of these Orders either in law or equity.

Notwithstanding the preceding, Ohio EPA and the Respondents agree that in the event that these Orders are appealed by any other party to the Environmental Review Appeals Commission, or any court, the Respondents retain the right to intervene and participate in such appeal. In such an event, the Respondents shall continue to comply with these Orders notwithstanding such appeal and intervention unless these Orders are stayed, vacated or modified.

IT IS SO AGREED:

INTER-OFFICE COMMUNICATION

TO: James Moseley, Remediation Group, DHWM-NWDO

FROM: John Weaver through Geoff Leking, Geologist 4, DDAGW-NWDO

DATE: June 19, 2002

SUBJECT: Campbell Soup Company, Henry County, OHD 005 419 171.

[Revised] RCRA Site Closure Plan - Former Holding Pit, document dated May 24, 2002; GeoTrans, Inc. Received by Ohio EPA (NWDO) on May 28, 2002.

Introduction:

The Division of Hazardous Waste Management (DHWM) has requested that the Division of Drinking and Ground Waters (DDAGW) perform a review of the above referenced document.

The Campbell Soup Company (Campbells) is located in north-central Henry County at 1273 State Route 110, Napoleon, Ohio. Campbells occupies approximately 63 acres at the above address and produces, packages, and distributes food goods.

Campbells produced containers (cans) for food goods in an onsite manufacturing facility until July 1998. The steel cans were coated with a two-phase material to act as a rust inhibitor and to increase the durability of the cans. Excess and waste coating material, existing in a semi-solid state, and also spent solvents were periodically dumped into two onsite holding pits at Campbells from 1981 to 1983. These holding pits were constructed on top of an elevated area from onsite dirt obtained from excavation activities performed throughout the Campbells site. The holding pits were reportedly lined with natural clay and compacted prior to emplacing the wastes. The total dimensions of the holding pits were approximately 20 feet by 35 feet by 2-3 feet deep. Wastes contained in the pits were excavated in 1983, mixed with sand, and disposed of offsite at the Evergreen Landfill. Constituents of concern (COCs) associated with the holding pits are volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs).

Director's Final Findings and Orders were issued to Campbells on October 18, 2000 and again on July 25, 2001 and required the facility in part, to close the former holding pits in accordance with OAC Rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20. Campbells subsequently submitted a RCRA closure plan for the former holding pits on October 31, 2001. The plan was reviewed and found to be inadequate as noted in a notice of deficiency (NOD) dated April 23, 2002 from Ohio EPA to Campbells.

Campbells has submitted a revised closure plan for the former holding pits dated May 24, 2002 which is the subject of this review.

Compliance Issues:

There are no compliance issues associated with this review.

Conclusions:

1. Campbells should review Comments 1 through 8 below to assist them in completing closure of the former holding pits (RCRA unit).

2. For questions, please contact John Weaver, Division of Drinking and Ground Waters, Northwest District Office, Ohio EPA, at (419) 373-3098. Any written correspondence should be sent to James Moseley, Division of Hazardous Waste Management, Northwest District Office, Ohio EPA, 347 North Dunbridge Road, Bowling Green, OH, 43402.

Comments:

Note: Ohio EPA comments on the Campbell Soup Company (Campbells) October 25, 2001 closure plan for the former holding pits are provided below in italics for reference. For the sake of brevity, the italicized Ohio EPA comments below have been abbreviated.

1. *Overall, Campbells has failed to provide a sufficient discussion of the site-specific geology and hydrogeology of the site in Sections 2.1, 3.0, 4.1, 4.2, 4.3, 4.6, and 4.8 of the closure plan. Campbells should include additional text/information in one all-encompassing section of the closure plan to include the following items....*

   Campbells has included additional text in Sections 4.1 and 4.3, and Appendices E, F, and G of the revised closure plan to further characterize the geology and hydrogeology of the former holding pits (RCRA unit) and surrounding areas. Campbells notes in Sections 4.1 and 4.3 that additional site-specific geological and hydrogeological data will be collected and presented to Ohio EPA during installation of the three shallow monitoring wells around the perimeter of the RCRA unit as part of a limited ground water investigation in support of closure. This issue has been adequately resolved.

2. *The following table notes selected analytical results from Geoprobe soil screening samples collected from borings PB-01-33, 34, 35, 45, and 46 (refer to Tables 1 and 2 of the closure plan)....*

It is unclear from a review of the closure plan text, data tables, and maps which Geoprobe borings were installed into natural unconsolidated materials outside of the mound area. It is also unclear what the corresponding soil analytical results are for these borings. Campbells shall include the appropriate text in the closure plan to identify those Geoprobe borings installed outside of the mound area and to reference the corresponding soil analytical results for the borings.

Campbells has appropriately revised Sections 4.6, 4.7, and 4.8 of the revised closure plan to state that the lithology of the natural unconsolidated zone beneath and adjacent to the RCRA unit is unknown. Although not explicitly stated, it can be gleaned from reading revised portions of Sections 4.6, 4.7, and 4.8 that no Geoprobe borings have been completed to date in the natural unconsolidated zone. If another iteration of the closure plan is necessary to obtain approval from Ohio EPA, then the agency recommends that Campbells provide clear and explicit language in a revised plan which states that no Geoprobe borings completed to date have been installed within the natural unconsolidated zone beneath and adjacent to the RCRA unit. Campbells will perform a limited shallow ground water investigation at the RCRA unit per Ohio EPA direction to resolve this issue.

Campbells states in Section 4.6, page 11, third paragraph, that 5 of the 37 Geoprobe advanced in May 2001 contained perched transient water within the RCRA unit. However, Section 4.5, page 8, second paragraph states that 31 Geoprobe borings were completed during the May 2001 investigatory effort. Ohio EPA requests that Campbells resolve this discrepancy in numbers of Geoprobe borings completed at the RCRA unit.

Figure 4B of the closure plan notes soil analytical results for Geoprobe boring PB-01-34 at three different depth intervals (8-9 feet, 21-22 feet, and 25-26 feet). Figure 4B also analytical results from a depth interval of 11.5-16.5 feet. This latter interval corresponds to the well screen installed at Geoprobe boring PB-01-34 and the analytical data represents ground water and not soil. Figure 4B should be revised appropriately.

Campbells has appropriately revised Figure 4B per the comment above. This issue has been adequately resolved.

Geoprobe boring PB-01-43 is not labeled on all figures included in the closure plan. Campbells shall appropriately revise the figures to clearly designate the boring.

Campbells has included Geoprobe boring PB-01-43 on all applicable figures in the revised closure plan. This issue has been adequately resolved.

3. *The following table notes selected analytical results from Geoprobe ground water screening samples collected from borings PB-01-33, 34, 35, 45, and 46 (refer to Tables 1 and 2 of the closure plan).... As such, Campbells concludes that shallow ground water in the natural unconsolidated zone cannot be affected by the mound and is not a completed exposure pathway for the purposes of the former holding pit closure investigation (Section 4.8, page 12).*

Ohio EPA disagrees with Campbells' conclusion that the potential for impacts to natural shallow ground water is extremely low based upon the following items...:

Therefore, in order to adequately characterize any affects to shallow ground water in the natural unconsolidated zone from the mound/former holding pit area, Campbells shall install a minimum of three monitoring wells around the downgradient periphery of the mound in the natural unconsolidated zone so that the well screens intersect the first encountered saturated zone. ...

During well drilling, Campbells should collect continuous split-spoon soil samples for description and fixed laboratory analysis of VOCs and SVOCs. The wells should be installed to a maximum depth of 20 feet bls...Campbells shall sample the wells for VOCs per Method 8260B and SVOCs per Method 8270 and submit them to a fixed laboratory for analyses. ... If no organic COCs are detected in the shallow monitoring wells downgradient of the mound above corresponding practical quantitation limits (PQLs) which provide the lowest limit of detection for the corresponding analytical method as specified in USEPA SW-846 Methods, then it can be concluded that no COCs have leached from the mound and impacted shallow ground water in the natural unconsolidated zone for the purpose of demonstrating clean closure of the former holding pits (refer to Comment 10 below for additional information).

Campbells shall install three shallow monitoring wells around the perimeter of the RCRA unit to determine if any impacts have occurred to any shallow saturated zones within the natural unconsolidated zone adjacent to the RCRA unit per Ohio EPA direction (Sections 14.0 and 14.1). Monitoring well locations are provided on Figure 6 and are amenable to Ohio EPA. Campbells has provided

brief, but adequate descriptions of the installation, development, sampling, and surveying of the three proposed monitoring wells. Campbells and their contracted consultant, GeoTrans, Incorporated, (GeoTrans), are reminded that they must follow standard industry protocols when performing the above activities and as such, should include an appendix in the closure certification document noting all those sampling and analysis methods followed during the closure investigation. If a second revision of the closure plan is required by Ohio EPA, then Campbells should include the sampling and analysis methods as an appendix in the document as described above. Campbells and GeoTrans are also reminded that appropriate well construction, boring, development, and sampling logs as well as all other pertinent monitoring well information and ground water analytical results should be generated and compiled during the closure investigation and submitted to Ohio EPA for review.

4. *Ohio EPA DDAGW disagrees with Campbells' assertion that there is no possibility for soil contamination to leach to the natural unconsolidated saturated zone (Section 4.6, page 9)....*

   Campbells has appropriately revised Section 4.6 of the revised closure plan to provide for a limited ground water investigation to support closure of the RCRA unit per Ohio EPA direction. This issue has been adequately resolved.

5. *It is premature for Campbells' to state that no natural shallow ground water is impacted beneath the unit as they have not provided any screening or confirmational analytical data in the closure plan to confirm this (Section 4.6, page 9). Upon completion of the additional closure investigation activities noted in Comment 5 above, Campbells can then evaluate the quality of natural shallow ground water downgradient of the mound.*

   Campbells has appropriately revised Section 4.6 of the revised closure plan to resolve the above comment. Campbells will perform a limited shallow ground water investigation at the RCRA unit per Ohio EPA direction as discussed in Comment 3 above. This issue has been adequately resolved,.

6. *Campbells states in several sections of the closure plan, including Section 4.7, page 11, that clay-rich native soils occurring underneath the mound act as a low permeability barrier to continued vertical migration. The closure plan does not clearly state which Geoprobe boring installed on top of mound, or at any other location for that matter, actually penetrates native soil and what the lithology of the native soils are. Campbells should provide a discussion in the closure plan as to which Geoprobe borings penetrate natural grade, what the lithology of the*

natural grade unconsolidated zone is, soil and ground water analytical data from the unconsolidated zone, and data to support the theory that the lithology of the unconsolidated zone inhibits vertical migration of COCs from the mound.

Refer to the Ohio EPA response to Comment 2 above.

7. *It is premature for Campbells to conclude that there are no potential risk-related contacts to COCs within shallow ground water in the natural unconsolidated zone until this zone is adequately investigated per Comment 5 above (Section 13.0, page 25). If the installation and sampling of the monitoring wells indicates that shallow ground water within the natural unconsolidated zone is impacted by COCs migrating from the mound, then Campbells will be required to adequately delineate the full rate, extent, and concentrations of COCs in the zone per OAC Rules 3745-54-90(A)(2)/3745-65-93(D)(4) and implement an appropriate ground water monitoring program per OAC Rules 54-90 to 99/3745-65-90(D)....*

   Campbells has appropriately revised Section 13.0 of the revised closure plan to resolve the comment above. Refer to the Ohio EPA response to Comment 3 above.

8. *If Campbells determines that shallow ground water within the natural unconsolidated zone has been impacted by COCs, clean closure of the former holding pit via the ground water pathway may be demonstrated by removal/decontamination or by performing a site-specific risk assessment. These two closure alternative are briefly summarized below. ...*

   Campbells has revised Section 14. 1 of the revised closure plan to state that if shallow ground water in the natural unconsolidated zone adjacent to the RCRA unit is determined to be impacted by the RCRA unit, then they will submit a ground water pathway closure plan to Ohio EPA for review and approval. This issue has been adequately resolved.

Staff Member: Tesha Fielding ☒ Placed Call ☐ Received Call

Conversation with:

Name: John Budge Phone #: (419) 373 3112 Fax #: ( )

Company / Address: Ohio EPA - air quality

Subject of call: Permits needed for MTTD?

NOTES:

I explained to John what we wanted to do at the Campbell site - run a medium temperature thermal desorption unit to remediate ± 3000 tons of soil contaminated with VOCs + SVOCs. He asked how long we would be on-site - I said approx 2 weeks. He thought, due to the short time the MTTD will be on-site, and because all remediation will be done on-site, that we would be exempt from an air permit (possibly under the new PTI exemption?) He will check with his supervisor + get back to me.

5/22/02 John called back. He explained we were exempt, as long as emissions of organics are less than 15 lbs/day, under Ohio Administrative Code Chapter 3745-31-03 (A)(d) Permit to Install exemptions - permit by rule exemptions. He also mentioned no letter from the director is needed.

RE: Revised RCRA Closure Plan
Campbell Soup Company
OEPA ID #OHD005419171

Dear Mr. Moseley:

Enclosed please find the revised RCRA closure plan for the former sludge pit unit located at Campbell Soup Company's facility located at 1273 State Route 110, Napoleon, Ohio.

The revised closure plan is submitted as requested in your letter of Notice of Deficiency dated April 23, 2002. The revised closure plan addressed all the areas indicated in the deficiency comments. The revised plan was prepared in accordance with the editorial protocol outlined in your letter.

We would appreciate your review and approval of the closure plan at your earliest convenience. Please call me at 856-968-4423 if you have any questions.

Sincerely,

CAMPBELL SOUP COMPANY

Re: Addendum to May 6, 2002, Response to Notice of Deficiency
Closure Plan
Campbell Soup Company
OEPA ID# OHD005419171

Dear Dr. Aly:

This correspondence is the second of two prepared to respond to the Ohio EPA's Notice of Deficiency letter, dated April 23, 2002. The Notice of Deficiency included an attachment (Attachment A) detailing the Ohio EPA's comments and proposed changes relating to the Closure Plan.

GeoTrans drafted an initial response to the Notice of Deficiency in a May 6, 2002, Response to Notice of Deficiency (Response) letter outlining our recommended actions at the Campbell Soup Company (Campbell) site. This response letter and Attachment A of the Ohio EPA's letter were used as an outline during a May 7, 2002, meeting with representatives of the Ohio EPA, Campbell Soup, and GeoTrans. The meeting was followed up with a telephone conference call held on May 8, 2002, to further discuss groundwater issues.

Per the results of the meeting and conference call we are sending this addendum to the May 6, 2002, Response to Notice of Deficiency, amending the following items in our initial Response letter:

1.0 We have agreed to install three monitoring wells on-site, which is intended to address the issues summarized in response number one. The installation of the wells will be outlined in the Revised Closure Plan, but in summary will include the following:

- Wells will be screened at first available water identified in the native soil unit,
- Wells will be installed using hollow-stem auger techniques no deeper than 20-feet into the native soil unit,

- The approximate locations of the proposed monitoring wells is shown on a figure faxed to the Ohio EPA on May 9, 2002, and attached to this letter,
- Soil lithology will be determined using continuous spilt-spoon samples,
- Soils will be screened for organics in the field using a PID meter,
- No soil samples will be collected for analytical evaluation unless a positive PID reading indicates the presence of contaminants, and
- Any groundwater entering the wells will be sampled and analyzed for VOCs and SVOCs.

The Revised Closure Plan will contain all of the information relating to a groundwater investigation at this site as requested in response number one.

1.2 The Ohio EPA has requested additional topographic information for the site. We have obtained 1953 pre-plant topographic information, and distributed it at the May 7 meeting. However, due to the limited time frame for re-submittal of the Revised Closure Plan we have agreed to provide additional topographic data for this site at a later date.

Additional geotechnical data will be presented in the Revised Closure Plan. This includes a historical geotechnical report, local well logs, and additional general lithology data from the area.

The Ohio EPA has requested an inventory of all wells within a ½-mile radius of the site. GeoTrans recently conducted an inventory of well logs within 5-miles of the site. We have identified one well within a ½-mile of the site. All wells within 5-miles of the site will be presented in the Revised Closure Plan.

3.3 The Ohio EPA requests that the schedule be revised to include time for obtaining relevant permits for treating the excavated soil and all water used/encountered during field work. We have obtained air emissions data from the medium temperature thermal desorption (MTTD) manufacturer and will submit it to the Ohio EPA Air Quality Division for review. We will add a disclaimer to the schedule in the Closure Plan stating "If the Ohio EPA determines that an air permit is required for the MTTD, then the Ohio EPA DHWM will be notified and the schedule presented in this Closure Plan will be delayed until an air permit is obtained".

We do not plan on obtaining any additional permits associated with the on-site WWTP. We will be discharging perched water, surface water, and rinseate water to the WWTP and have determined the WWTP can handle this discharge.

4.1 The Ohio EPA notes that once the contaminated soil is excavated, it will be considered a newly-generated waste. Newly-generated wastes require laboratory analysis to determine if the waste is hazardous. The Ohio EPA also notes that if the

waste is determined to be hazardous a RCRA Type B permit will be required for on-site treatment.

As discussed in the May 7 meeting, we will collect four discrete soil samples for TCLP analysis to determine if the soils on-site are hazardous. The samples will be collected from near known areas affected with organic compounds, specifically PB-01 at 5.5 feet, PB-01-34 at 8.5 feet, PB-01-32 at 6.5 feet, and PB-01-28 at 4.5 feet. However, to ensure a representative sample of the on-site materials will be collected we will prepare a vertical composite sample at each of the above-mentioned locations with material from 1-foot above and below the previously cited depths. If the soil is proven to a hazardous waste, we will most likely proceed with a hazardous waste investigation to delineate the hazardous waste on site. A RCRA Type B permit will not be sought and no hazardous waste will be treated on-site.

4.2 The Ohio EPA noted that the analytical data presented in the Closure Plan had very high detection limits. The limits presented in the Closure Plan were reporting limits, not method detection limits. The laboratory used on-site, New Age/Landmark, Inc., is reviewing the data and will re-issue lab reports showing all concentrations detected above the method detection limits. *We request that the Ohio EPA review the re-issued method detection limits and let Campbell's know if they are acceptable for closure and delineation samples. We request this is done in a timely manner to allow inclusion of all available delineation samples in the Revised Closure Plan. We will forward the re-issued laboratory reports to the Ohio EPA as soon as we receive them.*

In accordance with Ohio EPA requirements, we will obtain two non-detect soil samples in both the vertical and horizontal directions prior to submittal of a Certification Report. We will review the re-issued soil concentrations and the method detection limits to determine if additional delineation or closure samples will be required.

4.3 As discussed during the May 7 meeting, we have concluded that the wastewater treatment plant (WWTP) can handle the concentrations of organics in the perched water. In addition, we concluded that the perched water has the highest concentrations of organics, due to its continuous contact with the contaminated soil. Therefore, the on-site WWTP will be able to accept the surface water and rinseate water generated during the fieldwork and no pre-treatment analyses are considered necessary.

Per the Ohio EPA's request in the May 7 meeting, we will modify Section 14.0 of the Closure Plan to provide more detail on the methods, sampling analysis and protocol for treated soil, suspected clean soils, and the ditch surface water.

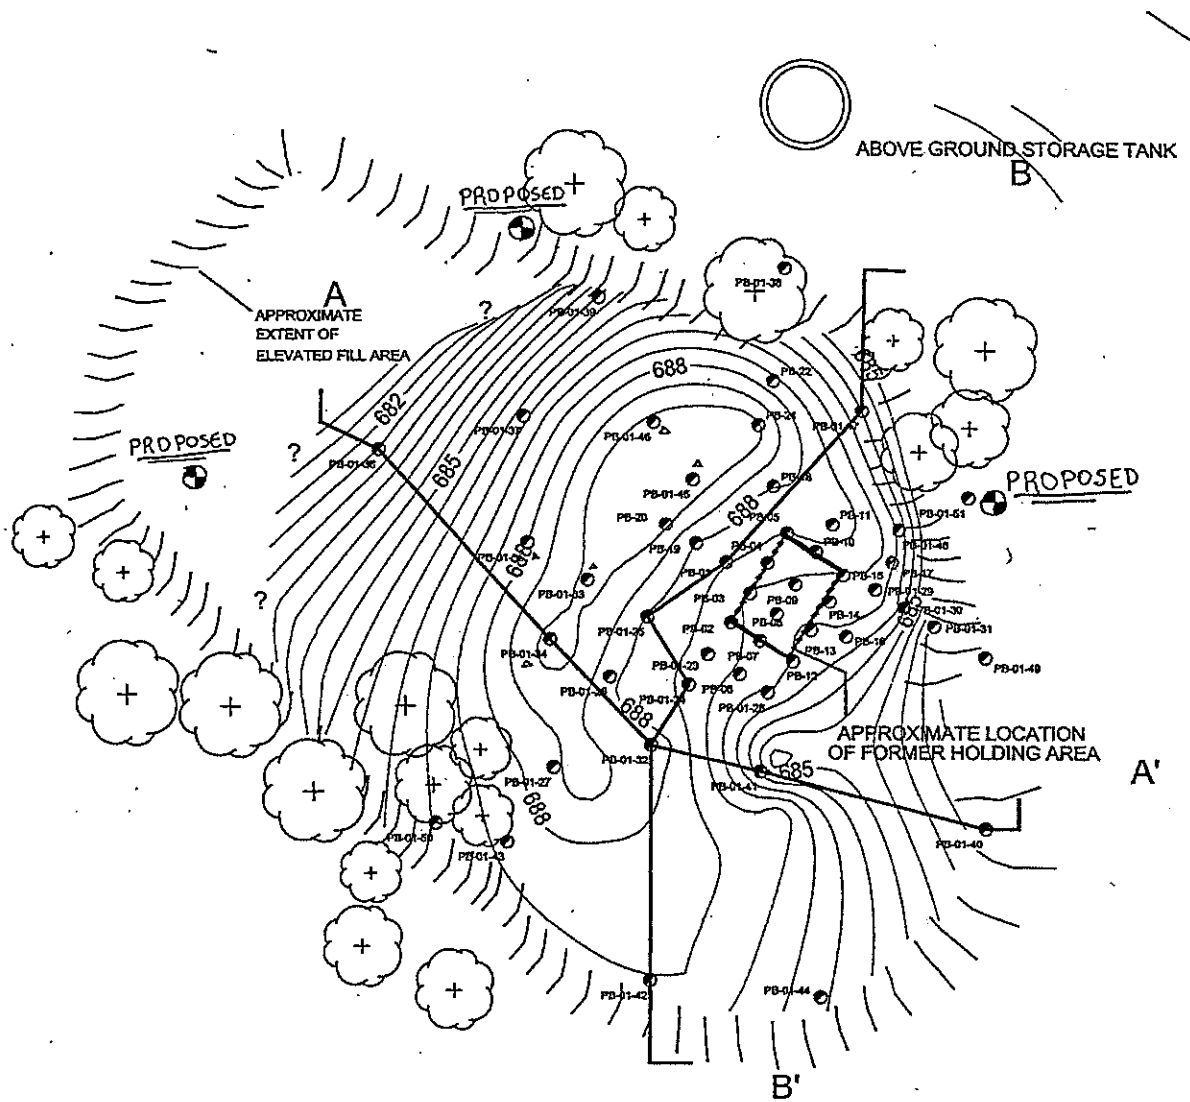
4.4 In addition to the actions proposed in our May 6 Response we will present a clear sampling procedure for both the confirmation of site cleanup samples and the site delineation samples.

8. The appropriate waste code, which relates to the original contaminants on site, will be included in the introduction sections of the Revised Closure Plan.

9. We wish to revise the last sentence of response number 9 to read "Runoff that comes into contact with the waste during the remediation action will be disposed of at the on-site WWTP".

10. At the May 7 meeting we distributed a copy of the January 1997 Environmental Protection Agency Quick Reference Fact Sheet Engineering Forum Issue Paper: Thermal Desorption Implementation Issues, recommending the manufacturer determine if a pilot study or test burn is necessary. Per the manufacturer's recommendation, we do not plan to run a bench scale trial or a test burn for treating the contaminated soils on-site with the MTTD.

    Regarding air quality issues, we have obtained air emissions data from the MTTD manufacturer and will submit this data to the Ohio EPA for review. We will work with the Ohio EPA to obtain an air emissions permit.



In accordance with the Notice of Deficiency a Revised Closure Plan shall be submitted to the Ohio EPA within thirty (30) days of receipt of the Notice of Deficiency. As the Notice of Deficiency was received on April 25, 2002, the Revised Closure Plan is due May 25, 2002. This is Saturday of Memorial Day Weekend; therefore we will plan to have the Revised Closure Report at the Ohio EPA office on Tuesday, May 28, 2002.

If you agree this letter, in addition to the May 6 Response to Notice of Deficiency, is an accurate summary of the meeting and phone conference with the Ohio EPA and accurately describes the future actions at this site, please forward this to the Ohio EPA for their records.

Sincerely,

Craig A. Savage, C.P.G
Senior Associate Hydrogeologist

Re: Response to Notice of Deficiency
Closure Plan
Campbell Soup Company
OEPA ID# OHD005419171

Dear Dr. Aly:

On October 31, 2001, GeoTrans, Inc., submitted the RCRA Site Closure Plan, Former Holding Pit Unit (Closure Plan) to the Ohio Environmental Protection Agency (Ohio EPA). The subject of the closure plan was the former holding pit at the facility located at 1273 State Route 110, in Napoleon, Ohio. The Closure Plan presented the methods and procedures proposed for closing and remediating the subject area. The Ohio EPA reviewed the Closure Plan and issued a Notice of Deficiency, dated April 23, 2002. The Notice of Deficiency included an attachment (Attachment A) detailing Ohio EPA's comments and proposed changes relating to the Closure Plan.

We understand that Campbell Soup Company (Campbell) has requested a meeting with the Ohio EPA to discuss the Notice of Deficiency and Campbell's proposed actions in detail. We are sending this letter to you in advance so you can forward it to the Ohio EPA in time for them to have adequate time to review our proposed actions and counter proposals before the planned meeting.

The following is a detailed response to the numbered comments in Attachment A:

1. We interpret the majority of the Ohio EPA's comment 1 as an argument to justify the need for groundwater sampling on site. Although GeoTrans agrees with the Ohio EPA, that it has not been conclusively demonstrated that groundwater has not been impacted at this site, we present additional information supporting our hypothesis that the likelihood impact to the groundwater is extremely low:

- Dry clay was observed at the bottoms of borings PB-01-34, PB-01-35, PB-01-37, PB-01-49, and others. This clay contained roots and vegetation suggesting the clay may be native soil. Because the clay was dry the perched water does not appear to penetrate vertically into the clay layer, the potential for downward vertical migration is minimal.

- Local area well logs 1.5 to 5 miles from the site (none have been identified closer) indicate a continuous 50-foot thick clay layer that extends to bedrock. This suggests that significant clay units exist on top of the bedrock, potentially limiting vertical migration of water and contaminants.

- The Ohio EPA was on-site when groundwater was encountered in borings PB-01-33, PB-01-34, PB-01-35, PB-01-45, and PB-01-26 in May 2001. At that time, the Ohio EPA agreed that the water found in these borings was perched at an elevation above natural grade.

- Nine geotechnical borings were advanced to depths of 30 feet in 1989 for construction planning purposes. Six of these were located approximately 150 feet north and three were located about 500-feet southeast of the subject area. These borings identified significant stiff clays from about 3-5 feet below land surface (bls) to the end of the boring. Seven of the 9 borings were reported to be dry after waiting 24 hours, and the remaining 2 contained water in isolated sand seams.

We present the following items, corresponding to the numbered responses in Attachment A, for discussion during our upcoming meeting.

1.1. The Ohio EPA disagrees with the conclusion presented in the Closure Plan that impacts of COCs to the natural groundwater are extremely low. We concede to the Ohio EPA that groundwater conditions should be evaluated at this site closer to the subject area. However the installation of a minimum of three monitoring wells on site, as required by the Ohio EPA, is premature.

There is considerable qualitative evidence indicating that the unconsolidated soils are unlikely to produce groundwater. Local well logs indicate massive clay layers on top of bedrock in the subsurface areas near the site. On-site boring logs also show stiff clay to at least 30 feet bls. If the lithology under the mound matches the well and boring logs then the perched water observed in borings on the northwest portion of the mound should not migrate vertically, and no usable groundwater should exist in the unconsolidated soils beneath the site.

We recommend the installation of one exploratory boring at the western base of the mound, beyond the limits of the elevated fill area. This boring will be advanced to a minimum depth of 50-feet or until bedrock is encountered. The boring will be

used to determine whether groundwater is present and to characterize the lithology of the native unconsolidated sediments beneath the study area. If water bearing units are observed in the unconsolidated soils during advancement of the exploratory boring, then we suggest implementing the Ohio EPA's proposed groundwater investigation, including determining groundwater flow direction, installing monitoring wells, and sampling of the groundwater. Details of the procedures for the exploratory boring and a groundwater investigation, if needed, will be outlined in the Revised Closure Plan.

The additional Ohio EPA suggestion of sampling soil samples at 2-foot intervals for VOC and SVOC analysis is completely unwarranted, as the borings will not be in the mound or in the subject area with contaminated soil. We recommend screening soils using a PID as a compromise position, with possible analyses of one or two samples.

The Ohio EPA comments state that the natural grade is approximately 670.06-feet AMSL. This elevation was obtained from an Excel spreadsheet with survey data sent to the Ohio EPA via e-mail. It should be noted that the professional surveyor on-site did not survey the "north bottom toe" and the "edge of pond" locations indicated at the end of this spreadsheet. A GeoTrans geologist surveyed these elevations at an earlier date. As this site has been re-graded numerous times, this elevation may or may not be the natural grade at the site.

1.2. The Ohio EPA has requested additional topographic information for the site. We have obtained 1953 pre-plant topographic information. The historical topographic information will be helpful in determining the native grade. Additional topographic elevation data will be obtained after completion of the exploratory boring.

The Ohio EPA also requests substantiation of the conclusion that the clay-rich native soil acts as a low permeability barrier to vertical migration, discussion of bedrock below the site, discussion of geotechnical data, and a discussion of groundwater occurrence and flow direction. The exploratory boring, as proposed above, will provide all of the requested information except groundwater flow information. If groundwater is encountered in the unconsolidated materials, then wells can be considered to determine the groundwater flow direction and gradient. The resulting information will be presented in the Certification Report.

The Ohio EPA has requested an inventory of all wells within a ½-mile radius of the site. As stated in Section 4.7 of the Closure Plan there are no groundwater users within one mile of the site. In addition, GeoTrans recently conducted an inventory of well logs within 5-miles of the site. These logs indicate that the subsurface lithology in the area consists of approximately 50-feet of clay continuous until bedrock. No wells were identified within ½-mile from the site.

1.3. The OEPA asks for revisions to Sections 4.5 and 6.1 for clarification. A summary of the clarification that will be provided in the Revised Closure Plan is provided below:

Section 4.5 lists only the thirty seven (37) compounds detected during the May 2001 investigation. Section 6.1 lists all compounds detected on site during all phases of the investigation. The exclusion of benzo(g,h,i)perylene in Section 6.1 was an oversight, and will be corrected in the Revised Closure Plan.

1.4. Section 4.6 will be revised to reflect the modified groundwater sampling plan, if necessary.

1.5. The Ohio EPA states that it is premature to conclude there are no potential COC in contact with the natural groundwater. As stated above, we agree that a groundwater evaluation may be appropriate. If the boring indicates that groundwater is present and has been impacted by COCs migrating from the mound, then Campbell should delineate the extent of the COCs in groundwater.

1.6. The requested sections will be modified in the Revised Closure Plan to reflect the modified groundwater sampling plan, if needed.

1.7. If contaminated groundwater is found on-site, the extent of impact should be determined and the two options described in the Ohio EPA's comments considered. A detailed closure plan for groundwater will be presented in the Revised Closure Plan, if necessary.

2. In removing the soils in stages, based on elevations, GeoTrans assumed that all soil beneath an elevation of 680-feet above mean sea level (AMSL) is impacted. We apologize for the error in Section 7.0, "Removal of Hazardous Wastes and Soil Remediation", stating that the excavation and screening process will continue until the elevation of 685-feet AMSL is reached. Section 7.0 will be corrected in the Revised Closure Plan to state the excavation and screening process will continue until the elevation of 680-feet AMSL is reached.

3. The schedule will be revised, as follows:

3.1. The activity "Verify initial elevation of contamination is reached" will be added to the schedule in Section 8.0 of the Closure Plan. The schedule will indicate that a registered professional engineer will be on-site for this activity and that the Ohio EPA will be notified at least 5-days prior to this activity.

3.2. The schedule will be revised to indicate that a Certification Report will be submitted to the Ohio EPA within 60 days of completion of soil removal.

3.3. The Ohio EPA requests that the schedule be revised to include time for obtaining relevant permits. During our meeting with the Ohio EPA, we wish to discuss the necessary permitting processes required at this site.

4. We offer the following discussion on the Ohio EPA's recommended changes to Section 14.0, "Sampling Plan and Analytical Procedures":

4.1. The Ohio EPA notes that once the contaminated soil is excavated, it will be considered a newly-generated waste. Newly-generated wastes require laboratory analysis to determine if the waste is hazardous. The Ohio EPA also notes that if the waste is determined to be hazardous a permit will be required for treatment. We recommend collecting four discrete soil samples to prepare a single composite sample for TCLP analysis. The samples will be collected from near known areas affected with organic compounds, specifically PB-01 at 5.5 feet, PB-01-34 at 8.5 feet, PB-01-32 at 6.5 feet, and PB-01-28 at 4.5 feet. If the soil is proven to a hazardous waste, a RCRA Part B permit will be applied for and obtained.

4.2. As stated in Section 5.0 of the October 1, 2000, RCRA Site Closure Investigation Work Plan "The EPA Method 5035 (field methanol preservation) procedure will not be used during this investigation phase of this work plan because it will negatively affect the detection limits of the on-site mobile laboratory apparatus" we agree with the Ohio EPA that methanol preservation dilutes the method detection limits of the soil samples. This section was revised in the Closure Plan after consultation with Eric Shultz, lab coordinator of the Ohio EPA's, laboratory, in Columbus, Ohio. He recommended using methanol preservation, even though the mobile laboratory would be analyzing all samples within 24-hours. We did not discuss low-range effects and procedures. We currently are reviewing the analytical procedure with the mobile laboratory subcontractor, and will have more details about their analyses by Tuesday.

In accordance with Ohio EPA requirements, we will obtain two non-detect soil samples in both the vertical and horizontal directions during and after excavation to confirm site delineation if it is determined that the existing soil analytical data is not useable for this purpose.

4.3. Ohio EPA has requested that Section 14 be modified to include a sampling analysis plan for the following:

- perched water
- surface water that may come into contact with the waste during excavation
- treated soils
- rinseate
- surface water in the ditch north of the mound
- suspected clean soils

Future sampling of perched water was not considered, as we planned to dewater these layers prior to excavation, and dispose of the perched water at the on-site wastewater treatment plant.

Surface water that comes into contact with the contaminated soil is addressed within the response to item #9.

Section 7 of the Closure Plan states that one sample per 500 tons of treated soil will be analyzed to verify cleanup goals have been met. Based on a total excavation weight of 6,000 tons, this represents approximately 12 samples, the minimum number of samples required to ensure data is statistically valid.

Rinseate handling procedures were described in Section 11. All rinseates will be disposed at the on-site WWTP, and no pre-treatment analyses are considered necessary.

The Closure Plan discussed analyses of the surface water drainage ditch in Section 13. It states that a sample will be collected from the location closest to the unit.

Section 7 of the Closure Plan states that one sample per 100 cubic yards will be obtained from the soil material segregated as potentially clean in the upper most lift of the excavation.

We will modify Section of the Closure Plan to describe the sampling analysis and protocol for treated soil, suspected clean soils, and the ditch surface water.

4.4. The Ohio EPA requests more information to demonstrate that the appropriate number of samples from the excavation sidewalls and floor were determined. The Closure Plan Review Guidance Document for RCRA Facilities, September 2000 recommends using a grid interval to collect the appropriate amount of samples. The recommended calculation for determining the grid interval uses statistical methods based on contaminant chemical masses. This is difficult to apply at this site, as the holding pit was demolished in 1983 and the remaining dried material was transported off site. Only residuals of the chemicals of concern remain at the site, confirmed by numerous soil samples at different depths. It is not practical to apply soil concentrations instead of chemical masses to determine the grid interval. Due to these complicating factors, we presented a grid interval determination based on the surface area of the excavation. This grid determination method is consistent with valid statistical procedures used in other states and by the USEPA on other CERCLA and RCRA investigations. To ensure a statistically valid set of closure samples are analyzed, we propose using a Coefficient of Variation Test (CV) to evaluate the data distribution. We will add the application of the CV test to Section 14.0 of the Revised Closure Plan.

4.5. The Ohio EPA requests copies of manifests for any waste disposed of off site. As stated in Section 9.0 of the Closure Plan documentation of hazardous material disposal will be provided to the Ohio EPA. In addition, we will revise Section 14.0 to state documentation of all hazardous waste disposal will be included in the Certification Report.

5. Section 17.0 "Certification" of the Closure Plan will be revised to include all items listed in Section 3.18 of the Closure Plan Review Guidance Document for RCRA Facilities, September 2000.

6. Geoprobe boring GP-01-43 will be clearly labeled on all figures in the Revised Closure Plan.

7. Figure 4B will be revised to eliminate all inconsistencies.

8. The appropriate waste code will be included in the Revised Closure Plan.

9. We agree with the Ohio EPA that surface water could potentially come into contact with contaminated soils on-site, and serve as a mechanism for contaminant transport. Surface water that comes into contact with the contaminated soil will be diverted to a lined collection area or sump and pumped to a holding tank for disposal at the on-site WWTP. Standard construction erosion and runoff abatement procedures will also be in effect during excavation and back-filling. Runoff that comes into contact with the waste during the remediation action will be tested, and if non-hazardous, disposed at the on-site WWTP.

10. The Ohio EPA recommends a bench scale trial for the medium-temperature thermal desorption (MTTD) to ensure the variable parameters in the process are established accordingly. We contacted the proposed MTTD contractor to discuss this item, and obtained assurances that numerous State managed sites, CERCLA sites, and RCRA sites have been remediated using this technology. Numerous case studies exist to document that that high concentrations of organics in soils, even clays, are removed to non-detect limits at 400 to 500 degrees Fahrenheit. Soils containing significant concentrations of organic contaminants have been effectively remediated to non-detect levels. Based on vender information and several case studies, we do not recommend conducting a test burn (requiring on-site setup) or a bench-scale trial (conducted in a laboratory using actual soil samples).

Regarding air quality issues, the off-gasses are treated using a catalytic oxidizer with a verified organic vapor destruction efficiency of 98.9%. Due to the effectiveness of this technology, the manufacturer of the MTTD has a generic air permit for discharge within the State of Michigan. We will need to coordinate with the Ohio EPA to determine the necessary air permits required for installing and running the MTTD.

We look forward to meeting with you and the Ohio EPA to discuss the above listed issues at this site.

Sincerely,

Craig A. Savage, C.P.G
Senior Associate Hydrogeologist

Re: **Revised Closure Plan Approval**
Campbell Soup Company
USEPA/OEPA ID# OHD005419171

Dear Dr. Aly:

On October 31, 2001, GeoTrans Inc., on behalf of Campbell Soup Company (Campbell), submitted to Ohio EPA a closure plan entitled RCRA Site Closure Plan, Former Holding Pit Unit for a sludge pit unit formerly operated on the property. The facility is located at 1273 State Route 110, Napoleon, Ohio 43545. Revisions to the closure plan were received May 28, 2002. The closure plan was submitted pursuant to the revised Director's Final Findings and Orders issued August 22, 2001, and Ohio Administrative Code (OAC) 3745-66-12 in order to demonstrate that Campbell's proposal for closure complies with the requirements of rules OAC 3745-66-11 and 3745-66-12.

The owner and the public were given the opportunity to submit written comments regarding the closure plan in accordance with the hazardous waste rule requirements. The public comment period extended from November 21, 2001, through December 20, 2001. No public comments were received by Ohio EPA.

Based upon review of Campbell's submittal and subsequent revisions, I conclude that the amended closure plan for the hazardous waste facility at 1273 State Route 110, Napoleon, Ohio 43545, as modified herein, meets the performance standard contained in OAC rule 3745-66-11 and complies with the pertinent parts of OAC rule 3745-66-12.

The amended closure plan originally submitted to Ohio EPA on October 31, 2001, and revised on May 28, 2002, by Campbell is hereby approved with the following modifications:

Approval with Modifications to Revised Closure Plan
Campbell Soup Company

Ohio EPA has determined that several site characterization activities must be performed by the facility to meet the general closure standards for hazardous waste facilities and the specific standards for the closure of surface impoundments. These activities must be completed as part of the closure period. Site investigation results will determine whether additional closure activities are needed or whether closure certification can be completed. The nature and extent of post-closure monitoring will also be directed by the results from sampling activities outlined in Section 14.4.

General Modifications to the May 28, 2002, Revised Closure Plan

1 No excavation activities as outlined in this plan shall be undertaken until any and all authorizations necessary to perform the actions contained herein are obtained from Ohio EPA. This includes any permits necessary pursuant to compliance with OAC rules 3745-31-02 and 3745-35-02. Copies of such authorization(s) shall be received by the Division of Hazardous Waste, NWDO prior to beginning any excavation.

2 Campbell shall follow standard industry protocols while investigating the potential for impact to shallow ground water including those activities outlined in Section 14.1. Data that demonstrates appropriate well construction, boring, development, and sampling logs as well as all other pertinent monitoring well information and ground water analytical results shall be generated and compiled during this investigation for submission to Ohio EPA. Standards for such activities can be found in the Ohio EPA guidance document entitle *Technical Guidance Manual for Hydrogeologic Investigations and Ground Water Monitoring* dated February 1995.

3 If analysis of water samples obtained from the ground water investigation show the shallow ground water has been impacted, within 30 days of receipt of the analytical

results, Campbell shall submit an amended closure plan which includes a revised schedule for closure and details the measures to be undertaken to delineate and remediate the areas of contamination.

4 If Campbell is not able to demonstrate clean closure of the contaminated area at the time of submission of the certification report, Campbell shall either excavate and dispose of all contaminated material off-site or submit an amended closure plan which details the measures necessary to close as a surface impoundment in accordance with OAC rule 3745-67-28. Should the latter alternative be chosen, Campbell shall submit a closure/post-closure care plan pursuant to OAC rules 3745-66-10 through 3745-66-20 and 3745-68-10.

Specific Modifications to the May 28, 2002, Revised Closure Plan

5 Section 8, Schedule for Closure. The revised closure plan is hereby modified to state that Campbell will complete and submit a site health and safety plan to Ohio EPA, NWDO within 30 days of receipt of a notice of approval by Ohio EPA of the closure plan.

6 Section 8, Schedule for Closure. The revised closure plan is hereby modified to state all information generated during the shallow ground water investigation shall be submitted to Ohio EPA, NWDO within 30 days of the installation of the last monitoring well.

7 Section 8, Schedule for Closure. The revised closure plan is hereby modified to state Campbell will receive the results of closure verification sampling within 180 days of receipt of a notice of approval by Ohio EPA of the closure plan.

8 Section 8, Schedule for Closure. The revised closure plan is hereby modified to state Campbell will conduct the engineer inspection and certification of site closure within 180 days of receipt of a notice of approval by Ohio EPA of the closure plan.

9 Section 11, Decontamination Efforts. For sampling and analysis involving waste delineation and confirmation, Campbell shall collect field blanks at a frequency of 10% of the total number of samples sent to the laboratory at a minimum of one field blank per day. Field blanks shall consist of analyte-free water poured over decontaminated sample collection equipment. They shall be analyzed for each

analysis requested for the soil samples being sent to the laboratory for that particular day of sample collection.

10 Section 14.4, Waste Characterization Sampling Plan. The revised closure plan is hereby modified to state material analyzed for the presence of hazardous waste characteristics as required by OAC rule 3745-52-11 shall utilize the Toxicity Characteristic Leaching Procedure (TCLP) extraction method. These samples shall be analyzed for the presence of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and metals using standard SW-846 methods.

11 Section 14.4, Waste Characterization Sampling Plan. The revised closure plan is hereby modified to state copies of manifests and receipts will be sent to Ohio EPA, NWDO for any waste disposed off-site. Campbell shall provide Ohio EPA with an estimate of volume for all wastes treated on-site and disposed off-site as a result of closure activities.

12 Section 17.0, Certification. The revised closure plan is hereby modified to state Campbell shall include a topographic map depicting the ground surface elevations of the mound and natural grade with a scale no greater than 1 inch equals 30 feet and a contour interval no greater than 5 feet. It shall also include detailed descriptions and locations of the topographic features in the vicinity of the mound and at Campbell's plant which may affect conditions at the mound (i.e., buildings, rivers, ditches, etc...).

13 Section 17.0, Certification. The revised closure plan is hereby modified to state that Campbell shall include a separate appendix in the closure certification report which contains all the data generated during the ground water investigation. This may be incorporated by reference if this information has already been submitted in its entirety to Ohio EPA, NWDO in distinct form. Lab data generated as part of this investigation may be placed elsewhere within the report.

14 Table 3 in the revised closure plan which contains the maximum concentrations for the constituents of concern is hereby replaced by the table in Attachment A.

End of Modifications

Compliance with the approved closure plan, especially including the modifications specified herein, is expected. Ohio EPA will monitor such compliance. Ohio EPA expressly reserves the right to take action, pursuant to chapters 3734. and 6111. of the Ohio Revised Code, and other applicable law, to enforce such compliance and to seek appropriate remedies in the event of noncompliance with the provisions and modifications of this approved closure plan. Please be advised that approval of this closure plan does not release Campbell from any responsibilities regarding corrective action for all releases of hazardous waste or constituents from any waste management unit, regardless of the time at which waste was placed in the unit.

You are hereby notified that this action of the Director of Environmental Protection is final and may be appealed to the Environmental Review Appeals Commission pursuant to Ohio Revised Code section 3745.04. The appeal must be in writing and set forth the action complained of and the grounds upon which the appeal is based. The appeal must be filed with the commission within 30 days after notice of the director's action. Notice of the filing of the appeal shall be filed with the director within three days after the appeal is filed with the commission. An appeal may be filed with the commission at the following address:

Environmental Review Appeals Commission
236 East Town Street
Room 300
Columbus, Ohio 43215

When closure is completed, OAC rule 3745-66-15 requires the owner or operator of a facility to submit to the director of Ohio EPA, certification by the owner or operator and an independent, registered professional engineer, that the facility has been closed in accordance with the approved closure plan. The certification by the owner or operator shall include the statement found in OAC rule 3745-50-42(D). These certifications should be submitted to:

Ohio Environmental Protection Agency
Division of Hazardous Waste Management
Attn: Pamela Allen, Information Technologies and Technical Support Section
P.O. Box 1049, Columbus, Ohio 43216-1049

Ohio EPA, Division of Hazardous Waste Management, strongly encourages you to consider pollution prevention options for any processes at your facility that generate

waste. While implementation of pollution prevention options is not required by Ohio laws and regulations, the application of waste minimization practices may help reduce the expense of remedial activities. Additionally, implementation of pollution prevention options may prevent the creation of new units and, as a result, eliminate the requirement to submit a closure plan in the future. For assistance in identifying and implementing pollution prevention options, contact James Moseley at 419-373-3015.

— I'd put Colleen's name here. She's the P2 pro for our district

Sincerely,

Christopher Jones

Re: **Notice of Deficiency**
Closure Plan
Campbell Soup Company
OEPA ID# OHD005419171

Dear Dr. Aly:

On October 31, 2001, Ohio EPA received the document entitled RCRA Site Closure Plan, Former Holding Pit Unit from GeoTrans Inc. regarding closure for a sludge pit unit formerly operated on the property which was submitted on behalf of Campbell Soup Company (Campbell). The facility is located at 1273 State Route 110, Napoleon, Ohio 43545. The plan outlines the methods and procedures that will be used to close and remediate the areas on the property in and around where semi-solid waste generated from a rust inhibitor process for cans was dumped prior to off-site disposal.

Ohio EPA, Division of Hazardous Waste Management (DHWM) has conducted a review of the above referenced closure plan, and has determined it to be incomplete and technically inadequate.

We have enclosed, as an attachment to this correspondence, detailed deficiency comments on the closure plan. Please provide a revised closure plan addressing all areas indicated in the deficiency comments. Ohio Administrative Code (OAC) rule(s) 3745-66-12 requires that such a revised closure plan be submitted to the director of Ohio EPA for approval within thirty (30) days of the receipt of this letter. Please note the closure plan review guidance cited in Attachment A can be found on the world wide web at: http://www.epa.state.oh.us/dhwm/cprg.html.

The revised closure plan shall be prepared in accordance with the following editorial protocol or convention:

1. Old Language is over-struck, but not obliterated.
2. New Language is capitalized.
3. Page headers should indicate date of submission.
4. If significant changes are necessary, pages should be re-numbered, table of contents revised, and complete sections provided as required.

Printed on Recycled Paper

The revised closure plan should be submitted to:

Ohio Environmental Protection Agency
Division of Hazardous Waste Management
Attn: Pamela Allen, Manager, Information Technologies and Technical Support Section
P.O. Box 1049, Columbus, Ohio 43216-1049.

A copy should also be sent to (two are preferred):

Ohio Environmental Protection Agency
Division of Hazardous Waste Management, Northwest District Office
Attn: James Moseley, Division of Hazardous Waste Management
347 Dunbridge Road, Bowling Green, Ohio 43402

Ohio EPA will, pursuant to OAC rule 3745-66-12, review the re-submitted plan and issue a final action approving or modifying the plan. Ohio EPA's final action on the re-submitted plan is appealable to the Environmental Review Appeals Commission.

If you wish to arrange a meeting to discuss your responses to this Notice of Deficiency, please contact James Moseley, at (419) 373-3015.

Ohio EPA, DHWM, strongly encourages you to consider pollution prevention options for any processes at your facility that generate waste. While implementation of pollution prevention options is not required by Ohio laws and regulations, the application of waste minimization practices may help reduce the expense of remedial activities. Additionally, implementation of pollution prevention options may prevent the creation of new units and as a result eliminate the requirement to submit a closure plan in the future. For assistance in identifying and implementing pollution prevention options, contact Colleen Weaver at (419) 373-3059.

Sincerely,

Shannon Nabors

Attachment A

DHWM and DDAGW Comments

1 Section 4.0 contains a description of the site geology and the site hydrogeology. This section does not contain sufficient discussion of the site-specific geology and hydrogeology of the site, because it does not contain any site specific data derived from borings through the natural formation at the site or provide adequate information regarding the possible extent of contamination. The specific deficiencies are detailed below.

1.1 The following table notes selected analytical results from Geoprobe ground water screening samples collected from borings PB-01-33, 34, 35, 45, and 46 (Please see Tables 1 and 2 of the closure plan). Ground water concentrations are presented in micrograms/liter (ug/l).

Location/ Parameter	PB-01-33	PB-01-34	PB-01-35	PB-01-45	PB-01-46
benzene	7	9	2	3	1
ethylbenzene	70	170	11	160	19
xylenes	44	71	9	271	42
1,2,4-trimethylbenzene	450	81	17	400	45
methyl 4,2-propanone	65	2	ND	ND	4
naphthalene	53	8	ND	76	4

The closure plan states that perched ground water residing within the mound and impacted soils identified from the Geoprobe borings generally occur at an elevation above that of natural grade (Section 4.3, page 6). As such, the plan concludes that shallow ground water in the natural unconsolidated zone cannot be affected by the mound and is not a completed exposure pathway for the purposes of the former holding pit closure investigation (Section 4.8, page 12).

Ohio EPA disagrees with the conclusion that the potential for impacts to natural shallow ground water is extremely low based upon the following items:

- The ground surface elevation of Geoprobe boring PB-01-34 is 689.3 feet AMSL. The bottom of the PVC Geoprobe well screen is 16.5 feet below land surface (bls) or 672.8 feet AMSL, and the elevation of natural grade is approximately 670.06 feet AMSL. This leaves only 2.74 feet of separation between the bottom of the well screen and natural grade,

- Based upon the table above, a number of VOCs and SVOCs were detected in perched ground water at a depth of 11.5-16.5 feet bls at boring PB-01-34, including benzene above its maximum contaminant level (MCL). This indicates that impacted perched ground water within the mound exists only 2.74 feet above natural grade,

- The closure plan states that perched ground water may exit the mound via seeps along the mound walls and along the basal portion of the mound (Section 4.3, page 6 and Section 4.7, page 10) which implies migration and impact to areas outside and beneath the mound is possible,

- No shallow ground water screening data from the natural unconsolidated zone off the mound has been presented in the closure plan,

- Organics in the soil have been detected at a depth of at least 16 feet below the top of the mound (boring PB-01-25), and it is stated that the extent of soil impact is much larger than the physical limits of the former holding pit area (Section 2.1, page 3),

- The mound, which is comprised of varying amounts of fill, sand, silt, and clay, has undergone periods of reworking, settlement, and disturbance since its construction. The variable composition and reworking of the mound may have created preferential pathways and allowed increased migration of contaminants of concern (COCs) from the sides and underneath the mound,

- If a shallow natural unconsolidated zone beneath the mound is impacted by COCs migrating from the mound, there may be other associated risks including dermal and inhalation exposures to onsite construction and utility workers. In addition, the closure plan states in Section 4.7, page 11 that there is potential for exposure to seeps that may be discharging from locations around the periphery of the mound, and

- Impacted residual soils and fill have been residing in the former holding pit area and portions of the mound since at least 1981. Potential leaching of COCs from the mound may have been occurring for a period of 22 years while no evidence has been provided to indicate impacted soils and perched ground water have not leached COCs to underlying native unconsolidated materials and shallow ground water.

Therefore, in order to adequately characterize any effects to shallow ground water in the natural unconsolidated zone from the mound/former holding pit area, Campbell shall install a minimum of three monitoring wells around the downgradient periphery of the mound in the natural unconsolidated zone so that the well screens intersect the first encountered saturated zone.

For the purpose of installing the wells downgradient of the mound, Campbell will have to consult all available information (i.e., ground topography, published reports, maps, Geoprobe data, etc . . .) to approximate the direction of shallow ground water flow in the natural unconsolidated zone. Campbell will be required to submit a detailed sampling and analysis plan (SAP) per OAC rules 3745-54-97/3745-65-92 to include those methodologies for the drilling, installation, development, surveying, and sampling of the monitoring wells. Campbell should consult the Ohio EPA guidance documents entitled, Technical Guidance Manual for Hydrogeologic Investigations and Ground Water Monitoring, (February 1995) for aid in preparing an adequate SAP.

During well drilling, Campbell shall collect continuous split-spoon soil samples for description and **fixed** laboratory analysis of VOCs and SVOCs. The wells should be installed to a minimum depth of 20 feet bls. Ohio EPA recommends that Campbell utilize 5-foot sections of PVC well screen. Due to the discontinuous nature of more permeable layers commonly observed within unconsolidated glacial till deposits in northwest Ohio, a 10-foot section of screen may also be utilized if warranted. Campbell shall sample the wells for VOCs per Method 8260B and SVOCs per Method 8270 and submit them to a fixed laboratory for analyses. Upon receipt of the analytical results, Campbell shall evaluate the data and provide a discussion of the results. If no organic COCs are detected in the shallow monitoring wells downgradient of the mound above corresponding method detection limits (or an alternative limit acceptable to the director) which provide the lowest limit of detection for the corresponding analytical method as specified in USEPA SW-846 Methods, then it can be concluded that no COCs have leached from the mound and impacted shallow ground water in the natural unconsolidated zone for the purpose of demonstrating clean closure of the former holding pits.

1.2 Campbell must revise the closure plan to provide the following information in one all-encompassing section of the closure plan to include the following items:

- Ground surface elevations of the mound and natural grade depicted on a topographic map with a scale no greater than 1 inch equals 30 feet and a contour interval no greater than 5 feet,
- Detailed descriptions and locations of the topographic features in the vicinity of the mound and at Campbell's plant which may affect conditions at the mound (i.e., buildings, rivers, ditches, etc . . .),
- Substantiation of the conclusions on page 11 regarding the barrier properties of the clay-rich native soils occurring underneath the mound,

  (This shall include more detailed discussion of the lithology of the natural unconsolidated materials beneath and adjacent to the mound to be supported

by Geoprobe or other such on-site borings, soil and ground water analytical data from the unconsolidated zone, and data to support the theory that the lithology of the unconsolidated zone inhibits vertical migration of COCs from the mound.)

- Discussion of bedrock beneath the mound (i.e., depth, lithology, ground water flow, etc . . .),
- Discussion of any geotechnical data collected (including permeability, grain size distribution, etc),
- Discussion of ground water occurrence and direction of flow in the unconsolidated zone beneath the mound, and
- An inventory of all wells within a 0.5-mile radius of Campbell's facility.

1.3 Section 4.5, page 8 includes a list of the constituents that were detected by the on-site laboratory, including benzo(g,h,i) perylene. Section 6.1, page 15 includes a similar list of all the constituents detected in the soil samples. This list includes all constituents listed on page 8 except benzo(g,h,i) perylene, but it also includes acetone and 1,4-dichlorobenzene which are not included on the list on page 8.

Campbell must revise these sections to explain the differences between these two lists and how they are to be used for site characterization and in determining the extent of contamination. Campbell must also state whether or not these constituents represent a comprehensive list of the chemicals of concern to be used in the risk assessment and ensure all COCs are accounted for in the risk assessment calculations.

1.4 Campbell shall revise Section 4.6, Page 9 to remove the assertion regarding no possibility for soil contamination to leach into the natural unconsolidated saturated zone.

1.5 It is premature to conclude, as stated in Section 13.0, page 25, there are no potential contacts to COCs within shallow ground water in the natural unconsolidated zone until this zone is adequately investigated.

If the installation and sampling of the monitoring wells indicates that shallow ground water within the natural unconsolidated zone is impacted by COCs migrating from the mound, then Campbell will be required to adequately delineate the full rate, extent, and concentrations of COCs in the zone per OAC rules 3745-65-93(D)(4) and implement an appropriate ground water monitoring program per OAC rules 3745-65-90(D). Campbell may also be required to evaluate all those potential risk receptors and exposure pathways in the closure plan (e.g., dermal and inhalation exposure to construction/utility workers) for the purposes of completing closure of the RCRA unit. The closure plan does not contain any ground water data to eliminate the natural unconsolidated zone as an exposure pathway at this point in the closure process.

Campbell shall revise Section 13 of the closure plan to remove the statement referenced above.

1.6 Campbell shall revise Sections 2.1, 3.0, 4.1, 4.2, 4.3, 4.6, and 4.8 to be consistent throughout the plan with regard to the changes required by Comment 1.

1.7 If it is determined that shallow ground water within the natural unconsolidated zone has been impacted by contaminants of concern, clean closure of the former holding pit via the ground water pathway may be demonstrated by removal/decontamination or by performing a site-specific risk assessment. These two closure alternatives are briefly summarized below. Utilization of either clean closure option discussed below would not relieve Campbell from first determining the full rate, extent, and concentrations of hazardous waste constituents in shallow ground water in the natural unconsolidated zone.

Clean closure via removal/decontamination

This closure alternative involves the implementation of a ground water monitoring program at the RCRA unit per OAC Rules 3745-54-90 to 99/3745-65-90(D) for the collection of a minimum of 8 rounds of site-specific ground water data encompassing at least a twelve month period. Sampling will be performed for all of the identified COCs, breakdown products, and those constituents reasonably expected to be in or derived from waste contained in the RCRA unit. If it can be documented that there are no organic (non-naturally occurring) constituents detected above PQLs which provide the lowest limit of detection for the corresponding analytical method as specified in USEPA SW-846 Methods during any of the 8 sampling events, then it will be concluded that the RCRA unit has not negatively impacted shallow ground water in the natural unconsolidated zone.

If during any of the sampling events non-naturally occurring constituents are detected above PQLs, then ground water monitoring shall continue a minimum of four additional quarters or until the four most recent sampling events do not show a detect for non-naturally occurring constituents. Instead of performing the additional ground water monitoring, Campbell may opt to perform a site-specific human health risk assessment for the ground water pathway.

Clean closure via risk assessment

This closure alternative also involves the implementation of a ground water monitoring program at the RCRA unit per OAC Rules 3745-54-90 to 99/3745-65-90(D). Campbell would be required to collect at least twelve (12) separate sample results from a total of at least three monitoring wells located within the plume. Ground water data would be used to determine ground water exposure point concentrations (EPCs) in the monitored zone. Upon determination of the ground water EPCs, Campbell would calculate the corresponding carcinogenic and noncarcinogenic risk for all appropriate receptors and exposure routes for the ground water pathway utilizing the appropriate use (industrial or residential) scenario.

If ground water monitoring had been adequately conducted per an approved program, and if ground water concentrations for the identified COCs are documented to be below health-based risk assessment standards, Campbell may use that data as part of their risk-based clean closure demonstration. The risk assessment demonstration would be submitted to Ohio EPA for review and approval as an amended closure plan.

2 Section 7.0, page 17 appears to indicate the excavation and screening will progress until elevation 685 AMSL is reached. It then details soil contained in the areas located in the second and third stages are assumed to be impacted and will be treated accordingly. However, the second stage, as defined on page 16, is from 680 to 675 AMSL. How the soil located between elevations 685 and 680 AMSL is to be handled is not clearly defined.

Campbell must revise this section to clarify this portion of the plan.

3 Section 8.0, page 20 of the closure plan lists the schedule and expected events for which the engineer will be on site and the events for which Ohio EPA will be notified.

3.1 Campbell must revise this section to indicate the registered professional engineer for the site will be on site shortly after the soil screening procedures indicate the initial elevation of contamination has been reached. It should also indicate Ohio EPA, NWDO shall be notified at least five days prior to the site visit.

3.2 Campbell must revise this section to indicate a certification report will be submitted within 60 days of completion of closure.

3.3 This schedule shall also address permits for waste water discharge, air pollution, and any other permitted activities that will affect the remediation activities. Please contact Ms. Lynette Hablitzel at (419) 373-3009 for issues related to waste water treatment and Mr. John Budge at (419) 373-3112 for issues regarding air emissions and ensure all applicable requirements are satisfied.

4 Section 14.0 contains details regarding the sampling analysis plan and analytical procedures to be followed.

4.1 Please note, once the contaminated soil is excavated, it will be considered to be a newly-generated waste. The material must be analyzed for the presence of hazardous waste characteristics as detailed in OAC rule 3745-52-11. The extraction method shall be the Toxicity Characteristic Leaching Procedure (TCLP) along with the appropriate analytical method. Should analytical results demonstrate the excavated soil to be characteristically hazardous, the material is subject to land disposal restrictions. **If the material is determined to be characteristically hazardous prior to treatment, it cannot be treated or disposed of on site without obtaining a RCRA Part B hazardous waste installation and operation permit.**

Campbell must revise Section 14.0 and the applicable portions of Section 7.0 to indicate the excavated material will be tested in accordance with Ohio Administrative Code (OAC) Chapters 3745-51 and 3745-52 at a frequency and locations acceptable to the director. Campbell should consult Ohio EPA's Closure Plan Review Guidance for RCRA Facilities, September 2000 for more information. Campbell must also include a discussion of what actions will be taken for material that is determined to be hazardous.

4.2 The sampling data included in the appendices of the closure plan is intended to be used to show the extent of contamination. However, the detection limits for those samples along the perimeter which are presumably clean were analyzed with very high detection limits compared to the limits normally expected to be used for SW-846 Methods 8260 and 8270 which may obscure the actual limits of contamination. This is due to the extraction procedure used for sampling. As indicated in SW-846, Method 5035, Section 1.8, "The closed-system purge-and-trap equipment employed for low concentration samples is not appropriate for soil samples preserved in the field with methanol. Such samples should be analyzed using Method 5030."

Section 6.2.2 of SW-846 indicates:

> The use of methanol preservation has not been formally evaluated by EPA and analysts must be aware of two potential problems. First, the use of methanol as a preservative and extraction solvent introduces a significant dilution factor that will raise the method quantitation limit beyond the operating range of the low concentration direct purge-and-trap procedure (0.5-200 µg/kg). The exact dilution factor will depend on the masses of solvent and sample, but generally exceeds 1000, and may make it difficult to demonstrate compliance with regulatory limits or action levels for some analytes.

The data also show unusually high surrogate recovery for the dilution factors indicated and many of the samples were less than 80% solids. These factors make the lab results useful as rough estimates of the limits of contamination at best.

Furthermore, the following table notes selected analytical results from Geoprobe soil screening samples collected from borings PB-01-33, 34, 35, 45, and 46 (refer to Tables 1 and 2 of the closure plan). Soil concentrations are presented in micrograms/kilogram (ug/kg).

Location/ Parameter	PB-01-32 8-9 feet bls	PB-01-32 14-15 feet bls	PB-01-45 10.5-11 feet bls	PB-01-43 8-9 feet bls	PB-01-34 8-9 feet bls
ethylbenzene	24,000	ND	21,000	ND	ND
xylenes	122,000	ND	50,890	ND	ND
1,3,5-trimethylbenzene	28,000	270	37,000	ND	ND
n-butylbenzene	25,000	ND	43,000	ND	ND
naphthalene	62,000	ND	21,000	ND	ND
2-methylnaphthalene	8,600	ND	5,000	ND	ND
pyrene	920	ND	ND	780	33,000
anthracene	520	ND	ND	ND	15,000
methylene chloride	ND	ND	700	ND	ND
fluoranthene	950	ND	ND	1,000	39,000

After a review of the soil boring analytical data and corresponding soil sampling intervals, it appears that impacted soils exist at and below the depth of perched ground water residing within the mound.

For these reasons, additional sampling must be performed to determine the extent of contamination. Campbell must revise the sampling and analysis plan and resubmit the closure plan to indicate the following:

4.2.1 Additional sampling beyond the extent shown in the closure plan will be performed either prior to or during the excavation or remediation

4.2.2 The extent of contamination shall be defined by at least two consecutive samples in both the horizontal and vertical directions where the analysis results in non-detects for all contaminants of concern.

4.2.3 The analytical methods will utilize detection limits appropriate for suspected clean samples. The detection limits shall be no more than the method detection limits for a given procedure or an alternative limit acceptable to the director.

4.3 Section 14.0 does not include enough information regarding the sampling analysis plan/protocol regarding perched water in the contaminated area or surface water that may come in contact with waste during the excavation. It also does not contain complete sampling information regarding sampling of treated soils, rinseate, surface water in the ditch north of the mound, suspected clean soils that are excavated, and any additional soil samples representing contaminations limits required in response to comment 4 above.

Campbell must revise this section to include the parameters to be analyzed, sampling frequencies, locations, type of sample, method of analysis, and all other pertinent sampling data for the items mentioned above.

4.4 Section 14.0 does not include enough information detailing how the appropriate number of samples of the excavation sidewalls and floor was determined. Ohio EPA's Closure Plan Review Guidance for RCRA Facilities, September 2000 specifies an acceptable method for determining how the appropriate number of samples is to be determined. Twelve is the minimum recommended number of samples to ensure statically significant data, but is not necessarily the appropriate minimum number to ensure the necessary clean up levels in the remaining soil have been attained.

Campbell must revise this section to include a narrative detailing a reasonable and statistically valid method of determining the minimum number of samples for the excavation sidewall and floor.

4.5 Campbell must revise Section 14.0 to indicate they will send copies of manifests and receipts to Ohio EPA, NWDO for any waste disposed off site. The plan must also be revised to state that Campbell will provide Ohio EPA with an estimate of volume for all wastes treated on-site and disposed off-site as a result of closure activities.

5 Campbell shall revise Section 17.0 to state documentation in the certification report shall at a minimum include those items listed in Section 3.18 of the Closure Plan Review Guidance for RCRA Facilities, September 2000. Any other applicable items, figures, or data must also be included.

6 Geoprobe boring PB-01-43 is not labeled on all figures included in the closure plan. Campbell shall appropriately revise the figures to clearly designate this boring.

7 Figure 4B notes soil analytical results for Geoprobe boring PB-01-34 at three different depth intervals (8-9 feet, 21-22 feet, and 25-26 feet). Figure 4B also contains analytical results from a depth interval of 11.5-16.5 feet. This latter interval corresponds to the well screen installed at Geoprobe boring PB-01-34 and the analytical data represents ground water and not soil.

Campbell shall revise Figure 4B to accurately label this boring. Ensure any other similar inconsistencies in the figures are revised accordingly.

8 In a letter dated April 3, 2001, from Ohio EPA, comment 4 stated the closure plan must include the appropriate waste codes for the wastes treated, stored, and disposed of in the pit. The closure plan does not appear to include that information. Ohio EPA expects that the appropriate waste code is D001.

Campbell must revise the appropriate section to include this information.

9 The closure plan does not detail what measures will be taken to prevent surface water run on and runoff or what will be done with surface water that comes in contact with waste.

Campbell must revise the appropriate section to indicate what measures will be taken regarding the items noted above.

10 The technology that is intended to be used to remediate the soil often involves a "test burn" or a bench scale trial to ensure the variable parameters in the process are established appropriately. The closure plan does not indicate such a test will take place.

Campbell must revise the appropriate section to discuss the necessity of such a burn. If one is planned, indicate how such a test will be conducted including notification to Ohio EPA, sampling procedures, and all other pertinent information.

INTER-OFFICE COMMUNICATION

TO: James Moseley, Remediation Group, DHWM-NWDO

FROM: John Weaver through Geoff Leking, Geologist 4, DDAGW-NWDO

DATE: April 10, 2002

SUBJECT: Campbell Soup Company, Henry County, OHD 005 419 171.

RCRA Site Closure Plan - Former Holding Pit, document dated October 25, 2001; GeoTrans, Inc. Received by Ohio EPA (NWDO) on October 31, 2001.

Introduction:

The Division of Hazardous Waste Management (DHWM) has requested that the Division of Drinking and Ground Waters (DDAGW) perform a review of the above referenced document.

The Campbell Soup Company (Campbells) is located in north-central Henry County at 1273 State Route 110, Napoleon, Ohio. Campbells occupies approximately 63 acres at the above address and produces, packages, and distributes food goods.

Campbells produced containers (cans) for food goods in an onsite manufacturing facility until July 1998. The steel cans were coated with a two-phase material to act as a rust inhibitor and to increase the durability of the cans. Excess and waste coating material, existing in a semi-solid state, and also spent solvents were periodically dumped into two onsite holding pits at Campbells from 1981 to 1983. These holding pits were constructed on top of an elevated area from onsite dirt obtained from excavation activities performed throughout the Campbells site. The holding pits were reportedly lined with natural clay and compacted prior to emplacing the wastes. The total dimensions of the holding pits were approximately 20 feet by 35 feet by 2-3 feet deep. Wastes contained in the pits were excavated in 1983, mixed with sand, and disposed of offsite at the Evergreen Landfill. Constituents of concern (COCs) associated with the holding pits are volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs).

Based in part on information submitted to Ohio EPA by Campbells, Ohio EPA identified the former holding pits as an unpermitted treatment, storage, and disposal unit subject to RCRA closure. Campbells was subsequently issued a Notice of Violation letter on May 16, 2000. Director's Final Findings and Orders were issued to Campbells on

October 18, 2000 and again on July 25, 2001 and required the facility in part, to close the former holding pits in accordance with OAC Rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20. The October 25, 2001 RCRA closure plan for the former holding pits is the subject of this review.

Compliance Issues:

The Campbell Soup Company closure plan for the former holding pits dated October 25, 2001 submitted per the July 25, 2001 Director's Final Findings and Orders is inadequate per OAC Rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20. Refer to the comments and conclusions below for specific explanations.

Conclusions:

1. Campbell Soup Company should review comments 3 through 10 below and submit the appropriate documentation to Ohio EPA for review and approval to resolve all outstanding ground water issues.

2. For questions, please contact John Weaver, Division of Drinking and Ground Waters, Northwest District Office, Ohio EPA, at (419) 373-3098. Any written correspondence should be sent to James Moseley, Division of Hazardous Waste Management, Northwest District Office, Ohio EPA, 347 North Dunbridge Road, Bowling Green, OH, 43402.

Comments:

1. The former holding pit area [RCRA unit] was constructed on top of a mound created from fill soils obtained from other portions of the Campbell Soup Company (Campbells) property (Figure 1). According to the closure plan, clay from a local source was used to construct containment dikes and to line the pits. Pertinent dimensions and elevations of the mound and natural grade are provided below:

    - the artificial mound which contained the former holding pits is approximately 20-25 feet above natural grade (Section 4.1, page 5); the elevation of the mound ranges from 680.2 - 689.8 feet above mean sea level (AMSL) [ground surface elevations from Geoprobe borings PB-01-51 and PB-20];

- the average elevation of the top of the former holding pit is approximately 686.97 feet AMSL (ground surface elevations from Geoprobe borings PB-05, 10, 15, 14, 12, 08, 02, 03, and 09);

- total dimension of former holding pit area is 20 feet wide, by 35 feet long, by 2-3 feet deep (Section 2.1, page 3);

- the elevation of natural grade surrounding the mound ranges is approximately 670.06 feet AMSL (ground surface elevation from location designated as "BOTTOM n. Toe";

- if the base of the pit was 3 feet deep or approximately 683.97 AMSL, then there is approximately 14 feet of separation between the base of the pit and natural grade; Campbells states that the former holding pit was approximately 11-16 feet above natural grade during its active phase (Section 4.1, page 5).

2. Provided below is a brief discussion of the geology and hydrogeology of the former holding pits and Campbells' property. Information was obtained from Geoprobe soil and ground water samples collected at Campbells in May 2000 and from published maps and reports at Ohio EPA (Figures 1 and 2).

- the mound is comprised of varying amounts of fill material and glacial till consisting of sand, silt, and clay with trace gravel; fill material consists of concrete, slag, rubber, wood, and asphalt (Section 4.2, page 5);

- based on Geoprobe boring logs for PB-01-38 and PB-01-51, which were installed off the confines of the mound, the lithology of the natural grade consists of silty sand to a depth of 4 feet below land surface (bls) and silty, sandy gray to olive clay to a depth of 16 feet bls;

- bedrock occurs at an elevation of approximately 620 feet AMSL per the ODNR Napoleon East bedrock topography map; the approximate topography of the Campbells' site in the vicinity of the mound is 680 feet AMSL; therefore, the thickness of unconsolidated material from the top of the mound to the top of bedrock is approximately 60 feet; and

- discontinuous lenses of more permeable material have been observed within the mound (Section 4.6, page 9); however, only 5 of the 37 Geoprobe borings completed at the mound, PB-01-33, 34, 35, 45, and 46, contained an adequate amount of perched ground water for sampling purposes (Figure 1); and

- wet or saturated soils indicating the presence of perched ground water within the mound have been identified at depths throughout the mound as indicated by Geoprobe boring data.

3. Overall, Campbells has failed to provide a sufficient discussion of the site-specific geology and hydrogeology of the site in Sections 2.1, 3.0, 4.1, 4.2, 4.3, 4.6, and 4.8 of the closure plan. Campbells should include additional text/information in one all-encompassing section of the closure plan to include the following items:

   - ground surface elevations of the mound and natural grade;

   - topographic features in the vicinity of the mound and at the Campbells' plant which may affect conditions at the mound (i.e., buildings, rivers, ditches, etc...);

   - more detailed discussion of the lithology of the natural unconsolidated materials beneath and adjacent to the mound (from other soil borings completed at Campbells?);

   - discussion of bedrock beneath the mound (i.e., depth, lithology, ground water flow, etc...);

   - discussion of any geotechnical data collected;

   - discussion of ground water occurrence and direction of flow in the unconsolidated zone beneath the mound; and

   - inventory of all wells within a 0.5-mile radius of Campbells.

4. The following table notes selected analytical results from Geoprobe soil screening samples collected from borings PB-01-33, 34, 35, 45, and 46 (refer to Tables 1 and 2 of the closure plan). Geoprobe soil screening samples were analyzed by an on-site mobile laboratory for analysis of volatile organic

compounds (VOCs) and semi-volatile organic compounds (SVOCs) per Methods 8260/5035 and 8270, respectively. VOC soil samples were preserved using methanol per Method 5035. Soil concentrations are presented in micrograms/kilogram (ug/kg).

Location/ Parameter	PB-01-32 8-9 feet bls	PB-01-32 14-15 feet bls	PB-01-45 10.5-11 feet bls	PB-01-43 8-9 feet bls	PB-01-34 8-9 feet bls
ethylbenzene	24,000	ND	21,000	ND	ND
xylenes	122,000	ND	50,890	ND	ND
1,3,5-trimethylbenzene	28,000	270	37,000	ND	ND
n-butylbenzene	25,000	ND	43,000	ND	ND
naphthalene	62,000	ND	21,000	ND	ND
2-methylnaphthalene	8,600	ND	5,000	ND	ND
pyrene	920	ND	ND	780	33,000
anthracene	520	ND	ND	ND	15,000
methylene chloride	ND	ND	700	ND	ND
fluoranthene	950	ND	ND	1,000	39,000

Ohio EPA DDAGW recommends that Ohio EPA DHWM review the Geoprobe soil screening data to determine if the full vertical and horizontal rate, extent, and concentrations of hazardous waste constituents has been delineated on and off the mound area. It is clear from a review of the soil boring analytical data and corresponding soil sampling intervals that impacted soils exist at and below the depth of perched ground water residing within the mound.

It is unclear from a review of the closure plan text, data tables, and maps which Geoprobe borings were installed into natural unconsolidated materials outside of the mound area. It is also unclear what the corresponding soil analytical results are for these borings. Campbells shall include the appropriate text in the closure plan to identify those Geoprobe borings installed outside of the mound area and to reference the corresponding soil analytical results for the borings.

Figure 4B of the closure plan notes soil analytical results for Geoprobe boring PB-01-34 at three different depth intervals (8-9 feet, 21-22 feet, and 25-26 feet). Figure 4B also analytical results from a depth interval of 11.5-16.5 feet. This

latter interval corresponds to the well screen installed at Geoprobe boring PB-01-34 and the analytical data represents ground water and not soil. Figure 4B should be revised appropriately.

Geoprobe boring PB-01-43 is not labeled on all figures included in the closure plan. Campbells shall appropriately revise the figures to clearly designate the boring.

5. The following table notes selected analytical results from Geoprobe ground water screening samples collected from borings PB-01-33, 34, 35, 45, and 46 (refer to Tables 1 and 2 of the closure plan). For clarification, Campbells installed 1-inch Geoprobe PVC wells with five-foot screens within the Geoprobe boreholes noted above to collect the perched ground water samples (Section 4.6, page 9). The screens were installed at depth intervals ranging from 11-16.5 feet bls. Ground water screening samples were analyzed by an onsite mobile laboratory for analysis of VOCs and SVOCs per Methods 8260 and 8270, respectively. Ground water concentrations are presented in micrograms/liter (ug/l).

Location/ Parameter	PB-01-33	PB-01-34	PB-01-35	PB-01-45	PB-01-46
benzene	7	9	2	3	1
ethylbenzene	70	170	11	160	19
xylenes	44	71	9	271	42
1,2,4-trimethylbenzene	450	81	17	400	45
methyl 4,2-propanone	65	2	ND	ND	4
naphthalene	53	8	ND	76	4

Campbells states that perched ground water residing within the mound and impacted soils identified from the Geoprobe borings generally occur at an elevation above that of natural grade (Section 4.3, page 6). As such, Campbells concludes that shallow ground water in the natural unconsolidated zone cannot be affected by the mound and is not a completed exposure pathway for the purposes of the former holding pit closure investigation (Section 4.8, page 12).

Ohio EPA disagrees with Campbells' conclusion that the potential for impacts to natural shallow ground water is extremely low based upon the following items:

- if the ground surface elevation of Geoprobe boring PB-01-34, for example, is 689.3 feet AMSL, the bottom of the PVC Geoprobe well screen is 16.5 feet bls or 672.8 feet AMSL, and the elevation of natural grade is approximately 670.06 feet AMSL, then there is only 2.74 feet of separation between the bottom of the well screen and natural grade;

- based upon the table above, a number of VOCs and SVOCs were detected in perched ground water at a depth of 11.5-16.5 feet bls at boring PB-01-34, including benzene above its maximum contaminant level (MCL); this indicates that impacted perched ground water within the mound exists only 2.74 feet above natural grade

- Campbells states in the closure plan that perched ground water may exit the mound via seeps along the mound walls and along the basal portion of the mound (Section 4.3, page 6 and Section 4.7, page 10);

- no shallow ground water screening data from the natural unconsolidated zone off the mound has been presented in the closure plan;

- detections of organics in soils has been detected at a depth of at least 16 feet below the top of the mound (boring PB-01-25); Campbells concedes that the extent of soil impacts is much larger than the physical limits of the former holding pit area (Section 2.1, page 3);

- while it has been reported that the former holding pit was constructed with clay containment dikes and a clay bottom, the same cannot be said for the mound which is comprised of varying amounts of fill, sand, silt, and clay which has undergone periods of reworking, settlement, and disturbance since its construction; the variable composition and reworking of the mound may have created preferential pathways allowing increased migration of COCs from the sides and underneath the mound;

- while it is true that potable water is supplied to Campbells from sources other than shallow natural unconsolidated zone, if this

zone is impacted from COCs migrating from the mound, there may be other associated risks including dermal and inhalation exposures to onsite construction and utility workers; Campbells states in Section 4.7, page 11 that there is the potential for exposure to seeps that may be discharging from locations around the periphery of the mound; and

- impacted residual soils and fill have been residing in the former holding pit area and portions of the mound since at least 1981; potential leaching of COCs from the mound may have been occurring for a period of 22 years; Campbells has provided no evidence that impacted soils and perched ground water have not leached COCs to underlying native unconsolidated materials and shallow ground water.

Therefore, in order to adequately characterize any affects to shallow ground water in the natural unconsolidated zone from the mound/former holding pit area, Campbells shall install a minimum of three monitoring wells around the downgradient periphery of the mound in the natural unconsolidated zone so that the well screens intersect the first encountered saturated zone. For the purpose of installing the wells downgradient of the mound, Campbells will have to consult all available information (i.e., ground topography, published reports, maps, Geoprobe data, etc...) to approximate the direction of shallow ground water flow in the natural unconsolidated zone. Campbells will be required to submit a detailed sampling and analysis plan (SAP) per OAC Rules 3745-54-97/3745-65-92 to include those methodologies for the drilling, installation, development, surveying, and sampling of the monitoring wells. Campbells should consult the Ohio EPA guidance documents entitled, 'Technical Guidance Manual for Hydrogeologic Investigations and Ground Water Monitoring,' (February 1995) for aid in preparing an adequate SAP.

During well drilling, Campbells should collect continuous split-spoon soil samples for description and fixed laboratory analysis of VOCs and SVOCs. The wells should be installed to a maximum depth of 20 feet bls due to the presence of clay rich tills and hardpan, identified from local private well logs, located at greater depths which would inhibit the occurrence and flow of shallow ground water in the natural unconsolidated zone. Ohio EPA recommends that Campbells utilize 5-foot sections of PVC well screen; due to the discontinuous nature of more permeable layers commonly observed within unconsolidated glacial till deposits in northwest Ohio, a 10-foot section of screen may also be

utilized if warranted. Campbells shall sample the wells for VOCs per Method 8260B and SVOCs per Method 8270 and submit them to a fixed laboratory for analyses. Upon receipt of the analytical results, Campbells shall evaluate the data and provide a discussion of the results. If no organic COCs are detected in the shallow monitoring wells downgradient of the mound above corresponding practical quantitation limits (PQLs) which provide the lowest limit of detection for the corresponding analytical method as specified in USEPA SW-846 Methods, then it can be concluded that no COCs have leached from the mound and impacted shallow ground water in the natural unconsolidated zone for the purpose of demonstrating clean closure of the former holding pits (refer to Comment 10 below for additional information).

6. Ohio EPA DDAGW disagrees with Campbells' assertion that there is no possibility for soil contamination to leach to the natural unconsolidated saturated zone (Section 4.6, page 9). Refer to Comment 5 above.

7. It is premature for Campbells' to state that no natural shallow ground water is impacted beneath the unit as they have not provided any screening or confirmational analytical data in the closure plan to confirm this (Section 4.6, page 9). Upon completion of the additional closure investigation activities noted in Comment 5 above, Campbells can then evaluate the quality of natural shallow ground water downgradient of the mound.

8. Campbells states in several sections of the closure plan, including Section 4.7, page 11, that clay-rich native soils occurring underneath the mound act as a low permeability barrier to continued vertical migration. The closure plan does not clearly state which Geoprobe boring installed on top of mound, or at any other location for that matter, actually penetrates native soil and what the lithology of the native soils are. Campbells should provide a discussion in the closure plan as to which Geoprobe borings penetrate natural grade, what the lithology of the natural grade unconsolidated zone is, soil and ground water analytical data from the unconsolidated zone, and data to support the theory that the lithology of the unconsolidated zone inhibits vertical migration of COCs from the mound.

9. It is premature for Campbells to conclude that there are no potential risk-related contacts to COCs within shallow ground water in the natural unconsolidated zone until this zone is adequately investigated per Comment 5 above (Section 13.0, page 25). If the installation and sampling of the monitoring wells indicates that shallow ground water within the natural unconsolidated zone is impacted by COCs migrating from the mound, then Campbells will be required to adequately

delineate the full rate, extent, and concentrations of COCs in the zone per OAC Rules 3745-54-90(A)(2)/3745-65-93(D)(4) and implement an appropriate ground water monitoring program per OAC Rules 54-90 to 99/3745-65-90(D). Campbells may also be required to evaluate all those potential risk receptors and exposure pathways in the closure plan (e.g., dermal and inhalation exposure to construction/utility workers) for the purposes of completing closure of the RCRA unit. The closure plan does not contain any ground water data to eliminate the natural unconsolidated zone as an exposure pathway at this point in the closure process.

10. If Campbells determines that shallow ground water within the natural unconsolidated zone has been impacted by COCs, clean closure of the former holding pit via the ground water pathway may be demonstrated by removal/decontamination or by performing a site-specific risk assessment. These two closure alternative are briefly summarized below. Utilization of either clean closure options discussed below would not relieve Campbells from first determining the full rate, extent, and concentrations of hazardous waste constituents in shallow ground water in the natural unconsolidated zone.

Clean closure via removal/decontamination

This closure alternative involves the implementation of a ground water monitoring program at the RCRA unit per OAC Rules 3745-54-90 to 99/3745-65-90(D) for the collection of a minimum of 8 rounds of site-specific ground water data encompassing at least a twelve month period. Sampling will be performed for all of the identified COCs, breakdown products, and those constituents reasonably expected to be in or derived from waste contained in the RCRA unit. If it can be documented that there are no organic (non-naturally occurring) constituents detected above PQLs which provide the lowest limit of detection for the corresponding analytical method as specified in USEPA SW-846 Methods during any of the 8 sampling events, then it will be concluded that the RCRA unit has not negatively impacted shallow ground water in the natural unconsolidated zone.

If during any of the sampling events non-naturally occurring constituents are detected avoid PQLs, then ground water monitoring shall continue a minimum of four additional quarters or until the four most recent sampling events do not show a detect for non-naturally occurring constituents. Instead of performing the additional ground water monitoring, Campbells may opt to perform a site-specific human health risk assessment for the ground water pathway.

Clean closure via risk assessment

This closure alternative also involves the implementation of a ground water monitoring program at the RCRA unit per OAC Rules 3745-54-90 to 99/3745-65-90(D). Campbells would be required to to collect at least twelve (12) separate sample results from a total of at least three monitoring wells located within the plume. Ground water data would be used to determine ground water exposure point concentrations (EPCs) in the monitored zone. Upon determination of the ground water EPCs, Campbells would calculate the corresponding carcinogenic and noncarcinogenic risk for all appropriate receptors and exposure routes for the ground water pathway utilizing the appropriate use (industrial or residential) scenario. If ground water monitoring had been adequately conducted per an approved program, then if ground water concentrations for the identified COCs are documented to be below health-based risk assessment standards, Campbells may use that data as part of their risk-based clean closure demonstration. The risk assessment demonstration would be submitted to Ohio EPA for review and approval as an amended closure plan.

Meeting Notes-Campbell Soup Company

Ohio EPA Meeting with Campbell Soup Company and GeoTrans, Inc.
Notice of Deficiency for the Closure Certification Report

Monday, September 29, 2003
12:00 PM to 2:00 PM
Conference Room A, Northwest District Office

Attendees:

Dr. Osman Aly-Campbell Soup Company
Michael Kovacich-GeoTrans, Inc.
Tesha Humphriss-GeoTrans, Inc.
Eric Getz-Ohio EPA, DHWM (from 12:00 PM to approximately 12:20 PM, Comments 1-8)
Michael Terpinski-Ohio EPA, DHWM (from approximately 12:20 PM to 2:00 PM, Comments 8-37)
Kara Reynolds-Ohio EPA, DHWM

This meeting was held to discuss Ohio EPA's NOD for the RCRA Closure Certification Report, Former Holding Pit Unit and the Response to Comments document from Campbell Soup Company (CSC).

Eric Getz sat in on the meeting until Michael Terpinski returned.

There were no major changes to CSC's responses concerning Ohio EPA's comments. CSC plans to follow the recommendations that Ohio EPA has requested for the revised certification. The only changes are as follows:

Comment 3-CSC will include an explanation of why the plan was not followed.

Comment 8-CSC will include an explanation of such things as what target depths are, how they were found and the actual depths (in feet), etc.

Comment 26-CSC did not take a field blank at a minimum of one per sampling day. Because of this, CSC will not be able to screen out any contaminants of concern from the risk assessment on account of lab contamination.

From: Kara Reynolds
To: Humphriss, Tesha
Date: 9/25/03 10:11AM
Subject: Re: GCN's for Campbell Certification Report

Tesha,

I received your request for the GCN's. As soon as I get the answers for you, I will pass that information on. However, I am not the person in charge of actually calculating the GCN's so I don't know exactly how long it will take. But I am working on it. As soon as I know something, I will e-mail you.

Please feel free to call me if you have any other questions about the risk.

Thanks,

Kara

>>> "Tesha Humphriss" <thumphriss@geotransinc.com> 09/25/03 08:49AM >>>
In follow-up to my voice mail this morning, the following 3 parameters do not have GCNs listed on either Attachment provided by the Ohio EPA(Attachment A from the Revised Closure Plan Approval Letter or Table 1 from the Cert Report NOD) - Can you provide the single chemical non-cancer and cancer direct contact numbers for acenaphthylene, chlorodibromomethane, and 2-hexaone?
Thanks!
Tesha

Subject: Monday's Meeting

Mike,

We will not be able to move the meeting to 11:30 AM on Monday, September 29. Mike Terpinski has prior obligations and will be a little late as is. So I will plan on meeting with you at noon on Monday. Do you need directions to our office? Please let me know if you have any other questions or concerns.

Thanks,

Kara Reynolds

Re: Response to Attachment A Comments from Ohio EPA Notice of Deficiency
RCRA Site Closure Certification Report Former Holing Pit Unit
Campbell Soup Supply Company, Napoleon, Ohio

Dear Ms. Reynolds:

On July 3, 2003, Campbell Soup Supply Company L.L.C. (Campbell), submitted the *RCRA Site Closure Certification Report, Former Holding Pit Unit* (Certification Report) to the Ohio Environmental Protection Agency (Ohio EPA). The subject of the Certification Report was the closure of the former holding pit at the facility located at 1273 State Route 110, in Napoleon, Ohio. The Certification Report presented the methods and procedures used to remediate and close the former holding pit. The Ohio EPA reviewed the Certification Report and issued a *Notice of Deficiency*, dated September 4, 2003. The *Notice of Deficiency* included an attachment (Attachment A) detailing Ohio EPA's comments. This letter presents our response to each comment and our proposed plan for revising the Certification Report.

In general, the comments fall into two categories: comments that request additional explanation regarding the reasons for minor modifications to the Closure Plan, and comments regarding the risk analysis. Representatives of Campbell worked closely with Ohio EPA staff throughout the closure process and provided written documentation regarding modification to the plan when requested by the Ohio EPA. Nearly all of the modifications to the closure plan were made because of weather, changing site conditions, excavation methods, and treatment system constraints. Additional detail explaining each modification is provided below in our responses to your comments.

We have requested a meeting with the Ohio EPA to discuss the comments and our proposed plan for revising the Certification Report. We are sending this letter in advance of the meeting for your review. We plan to revise the Certification Report and incorporate each of our responses, as well as the results from the additional activities that you have requested. Additional text, figures and tables will be a provided in the revised Certification Report, as agreed upon during the meeting.

Following is a detailed response to the numbered comments in Attachment A:

1. Campbell will submit a revised certification report to the Ohio EPA. The revised report shall follow the editorial protocol and convention presented in the Ohio EPA Notice of Deficiency, dated September 4, 2003.

2. Campbell will define "clean soil" in the Certification Report as soil that meets risk-based clean closure levels.

3. In the Closure Plan an area located approximately 100 yards to the northwest of the former holding pit and near the northwest base of the elevated area was described as a ditch. The ditch is located beneath a piping run and is clearly visible on the aerial photograph presented as Figure 2 in the Certification Report. Surface water runoff was observed in the ditch following a very significant rain event that occurred during the May 2001 investigation. This observation lead to the inclusion of the ditch as an alternate sampling point for the seeps. However, the ditch is predominately dry and water was not observed in the ditch during closure activities. Therefore, collection of a surface water samples from seeps or the swale was not possible. The Revised Certification Report will include this explanation.

4. All soil samples were collected from approximately 3 to 4 inches beneath the surface of the excavation floor and sidewalls. The elevation of the sample locations was determined by level survey at a later date. All analytical tables will be revised to include the sample depths or sample elevations where appropriate.

5. As explained on page 21 of the Closure Plan, the purpose of the initial soil excavation was to remove non-impacted overburden from the elevated area. Field screening with a photo ionization detector (PID) was performed in accordance with Section 7 of the Closure Plan. The over burden was segregated into suspected clean and intermediate (indeterminate in the Closure Plan) soil stockpiles. The initial soil excavation began before the treatment system was operational. Therefore, contaminated soil was left in the excavation until the treatment system and the temporary contaminated soil staging was constructed. The methodologies detailed in the Closure Plan were strictly followed, no alteration in the Closure Plan occurred at this point in the project.

6. Section 3.3 of the Certification Report will be modified to include the following: "(0.0-9.9)" after the phrase "less than 10 ppm" in the first bullet and "(10.0-99.9)" after the phrase "less than 100 but higher than 10 ppm" in the second bullet. During initial excavation activities one soil sample exhibited a PID reading of 10.0 ppm. This soil was considered intermediate (indeterminate in Closure Plan) and was placed in the intermediate soil stockpile.

7. The reference to "100-ton sample grid" at the top of page 11 was an error. The Certification Report will be revised to state "100-yard sample grid".

8. Target depths were measured during excavation activities using level and rod survey techniques. A comprehensive level survey of the entire excavation floor was conducted following Ohio EPA's inspection of the excavation. Methodologies to determine the target depth will be included in the Revised Certification Report. In addition, a figure and a table will be prepared to present the location and the fate of each sample collected at the site. The figure will include the final excavation grade and the locations of all the samples collected at the site from 1999 through 2003.

9. As detailed in Section 3.4 of Certification Report, soil was not excavated in horizontal stages ("layer cakes") but rather in thirds ("troughs") from west to east. The three principle reasons for this change were:

    - To avoid the use of second staging area for the treated soil, the excavation strategy was modified to facilitate closure and backfill of the excavation in thirds. This was required due

to limited capacity (1200 tons) near the treatment system discharge. However, a second treated soil staging area was later implemented due to construction debris encountered in the western third of the excavation.

- To completely remove the impacted soil from each area and prevent cross-contamination by equipment used to excavate and transport contaminated soil.

- To be more efficient by excavating all the way down to the target depths in each area rather then excavating in the same area two or three times.

Target depths were determined during excavation activities by level survey.

10. Sample analysis for VOCs requires preservation in the laboratory, with sodium bisulfate, within 48 hours of sample collection in an Encore. After preservation, samples must be analyzed within 14 days. In addition, the excavation remained open for inspection by the Ohio EPA and our Ohio registered professional engineer. The open excavation facilitated the collection of additional certification samples when requested by Ohio EPA as detailed in Section 4.2 and 4.3 of the Certification Report.

    The number of confirmation samples was adequate to demonstrate that the impacted soils was remediated or removed from the site.

11. The vertical site delineation sampling was completed in accordance with the approved plan, after all of the contaminated soil was removed from the excavation. The excavated soil was placed back into the test pits.

12. Sample locations were selected through biased sampling instead of random sampling. Section 4.7 of the Certification Report will be revised to present the following biased selection criteria for the vertical site delineation sample locations:

    - Proximity to known areas of impact identified during the investigation and remediation (TP-2 and TP-3),

    - Because no other samples were collected in the general area, the test pits samples would provide another check to be certain that the additional impact did not exist at lower elevations (TP-1 and TP-4).

13. Geoprobe samples were not collected because the excavator was already available on site for digging test pits. In addition, a test pit provided visual inspection for potential impact.

14. Although the tests pits were placed near floor samples, this was not the only criterion used for their selection. Please see our response to comment #12.

15. Sample depths or sample elevations will be included on all tables where appropriate.

16. Table 6a and 6b were incorrectly labeled. "Depth in Feet" should have been labeled as "Tons of Treated Soil". The tables will be corrected and included in the revised Certification Report.

17. Table 9 will be revised to include the J values such as 3.2 ug/kg reported for 1,3,5-trimethylbenzene at FL-35.

18. The coefficient of variance test was performed on the confirmation samples in accordance with Section 14.6.4 of the approved Closure Plan.

19. The power plant will be labeled on Figure 2 of the Revised Certification Report.

20. The sample nomenclature for grid cell SW-46 was complicated by the additional excavation of impacted soil and the subsequent sampling that occurred in this area. Additional samples were collected as detailed in Section 4.4 of the Certification Report. SW-46 (X) corresponds to grid cell 46, where X represents the sequential sample collected after each phase of the additional soil excavation. The last sidewall sampled collected at SW-46 was SW-46 (4).

    SW-46-6' was labeled independently because it was investigative in nature and represented the southeastern face at 6 feet below surface grade. SW-46-6' was collected for two reasons:

    - Field observations suggested impact at that depth,
    - The additional excavation in that area spanned two grid intervals.

21. The Ohio EPA requests additional information to be presented in Appendix A. The following letters correspond with comment #21 in Attachment A of the Notice of Deficiency:

    a. We apologize for omitting the health and safety plan (HASP) from the Certification Report. Two HASPs will be included in the revised Certification Report. The first, dated August 13, 2002, was for the August/September 2002 soil and groundwater investigation. The second, dated August 28, 2002, was for the remediation portion of the project.

    b. As stated in Section 4.8 of the Certification Report "Of the 3,300 tons transported to the Williams County Landfill during the first disposal event, approximately 100 tons of soil from treated soil pile #4 was added as mixing sand, due to the high water content of a portion of the impacted soil in the stockpile area." The 100 ton quantity was estimated using ML Chartier Weight Tickets produced from the scale within the bucket of the loader. Therefore, the 100 tons of treated soil transported to Williams County Landfill are included in the 3,300 tons transported to the landfill and are documented with the waste manifests included in Appendix D. Section 4.8 of the Certification Report will be revised to clarify this point by referring to Appendix D and Table 5.

    c. In GeoTrans' October 23, 2002, *September 2002 Soil Sample Results* horizontal delineation of VOCs was presented. The Ohio EPA did not respond or deny the completion of the VOC delineation.

    The Revised Certification Report will contain the HASPs and the following other additional correspondence:

    - September 27, 2003 – "August 2002 Soil Samples"
    - September 25, 2003 – Cover letter of transmittal for Shallow Groundwater Report.

22. The Ohio EPA requests additional information to be presented in Appendix B. The following letters correspond with comment #22 in Attachment A of the Notice of Deficiency:

    a. Vinyl acetate was unintentionally omitted from all of Brighton Analytical laboratory reports. Brighton Analytical will revise all of their lab reports to include analysis for vinyl acetate.

    b. At the time of this response letter, we are working with BEC Laboratory to work out this issue. We will have a response ready to discuss at our September 29 meeting.

    c. At the time of this response letter, we are working with BEC Laboratory to work out this issue. We will have a response ready to discuss at our September 29 meeting.

    d. See response 22a.

    e. The Revised Certification Report will include pages 5 and 6 for SW-46 (4) and pages 1 and 2 for SW-46-6'.

    f. See response 22a.

23. Complete laboratory packages and data validation review will be included in the Revised Certification Report.

24. During remediation efforts, the following duplicate samples were taken to confirm the initial lab results:

    - VR-02-01 (2)
    - VR-03-04 (2)

    The duplicate results for the verification of remediation samples did not change our closure strategy and were not used in the residual risk calculation.

    IS-02-02 (2) was also a duplicate sample. This sample was duplicated, due to failed laboratory QA tests for IS-02-02.

    We propose including an additional table in the Revised Certification Report listing all samples collected at this site and identifying the collection date, purpose of the sample, and noting whether or not the sample remains on site.

25. Initially, samples taken from the treated soil stockpiles (VR samples) were not screened. We began physical screening of samples to obtain a homogeneous sample (e.g. prevent large pieces of soil, which would clump together due to the cold weather, from getting into the sample). The unscreened sample was taken to validate the screening process. This will be noted in the Revised Closure Plan in the table proposed in response #24.

26. Five (5) field blanks, or 10% of the sample population, were taken during remediation activities. The field blank samples were collected by pouring DI water over decontaminated sampling equipment. All field blanks reported ND values for all chemicals of concern. The results of the

field blanks did not change throughout the project, ensuring a reliable decon procedure at this site.

27. The Revised Certification Report will include a topographic map of the former holding pit to meet all the requirements of the Revised Closure Plan Approval Letter (RCPAL).

28. Per the RCPLA the *Shallow Groundwater Report* will be eliminated from Appendix A and included in a separate Appendix in the Revised Certification Report.

29. Section 5 of the Certification Report outlines the pretreatment closure strategy (MCAGCNs), the post treatment closure strategy (GCNs), and the challenging field conditions that required a change in the closure strategy. In summary, the closure strategy was changed for the following reasons:

    - During excavation, demolition debris including roofing materials were identified within the elevated area. Coal tar is commonly associated with roofing materials. Numerous SVOCs, including pyrene, phenanthrene, chrysene, anthracene, and benzo(a)pyrene, are found in coal tar and were identified in the investigation and verification samples.

    - The MTTD unit successfully eliminated VOCs in the treated soil but did not eliminate the SVOCs associated with coal tar. If implemented, the pretreatment strategy would not have met the requirements for unrestricted closure.

    - All of the parameters that are still detected (present) at the site are at least an order of magnitude lower than detections demonstrated during the investigation. Since significant treatment and removal of impact soils has occurred at the site, the site does not present the same risk to the environment as it did prior to treatment.

    Campbell worked with the Ohio EPA to develop an acceptable alternative closure strategy. The alternative closure strategy was referred to as the post treatment closure strategy in the Certification Report. The basis for the post treatment closure strategy was summarized in a letter to the Ohio EPA on January 17, 2003 from GeoTrans. The Ohio EPA did not response or denies the basis for the post treatment closure strategy.

30. A statistical evaluation of all samples used in the closure risk evaluation will be included in the Revised Certification Report. Although not included in the Certification Report, GeoTrans did run an analysis of the distribution of the confirmation samples, and found the samples to be neither normally nor log-normally distributed. We discussed these results with the Ohio EPA, and determined the distribution of the data was due to the large amount of non-detects obtained from the floor and sidewall samples.

31. The Ohio EPA has understood the intent of the first sentence in Section 5.2.3 correctly and we will clarify the intent of this sentence in the Revised Certification Report.

32. The risk calculation will be revised to include all samples collected at this site that were not treated by the MTTD unit or removed during off-site disposal. In addition to the Table proposed in response #24, a table will be added to the Revised Certification Report summarizing all investigation samples used in the risk calculation to close this site.

33. GCN's that are listed in Attachment A of the RCPAL will be used for all parameters listed on Attachment A. If a GCN is not presented in Attachment A, we will use the GCN's presented in Table 1 – "Residual Generic Cleanup Numbers for Ohio Hazardous Waste Closures". If a value is not on either list, GeoTrans will request the value from the Ohio EPA.

34. We are proposing to add two tables to the Revised Certification Report, as presented in response #24 and #32, which will show all samples used in the risk calculation for this site. The UCL values were calculated, and will be re-calculated, with all of the samples used in the risk calculation. A sample UCL calculation will be presented in the Revised Certification Report.

35. Carbazole will be added to the cancer risk calculation using the values presented in Table 1 – "Residual Generic Cleanup Numbers for Ohio Hazardous Waste Closures".

36. As proposed in response #24 and #32, table will be added to the Revised Certification Report summarizing the samples used in the risk calculation for this site.

37. As stated in response #32, the risk calculation will be revised to include all samples collected at this site that were not treated by the MTTD unit or removed during off-site disposal.

    a. Acenaphthene will be left out of the residual risk calculation as GeoTrans can prove that the sampling points where this chemical was found (PB-01-32-8-9', PB-01-34-8-9', and PB-01-41-4-5') were excavated during remediation activities.

    b. Due to the low detection of the parameters listed, they will be eliminated from the residual risk calculation.

    c. The risk calculation will be revised to include all samples collected at this site that were not treated by the MTTD unit or removed during off-site disposal.

We look forward to meeting with you to discuss the above listed issues.

Sincerely,

Michael S. Kovacich

Re: Certification Period
Campbell Soup Supply Company, Napoleon
Former Holding Pit Unit
OHD 005 419 171

Dear Dr. Aly:

On September 12, 2003, Campbell Soup Company (CSC), located at 1273 State Route 110, Napoleon, Ohio, submitted a request, via e-mail, for an extension to the certification revision period specified in the Notice of Deficiency (NOD) dated September 4, 2003. CSC has requested this extension because they would like to meet with the Ohio Environmental Protection Agency (Ohio EPA) to discuss the comments in the NOD before submitting a revised certification report. As stated in the e-mail from Michael Kovacich, CSC "received the Notice of Deficiency on September 8, 2003. The notice states that per OAC rule 3745-66-12, the revised certification report must be submitted to the Director for approval within thirty days of receipt of the letter. Therefore, the revised certification report is due to the Director on October 8, 2003. The earliest available date [to meet with Ohio EPA] September 29, 2003 only allows a maximum of 10 business days to revise and submit the certification report." CSC goes on to request an extension due to the period between the receipt of the NOD and the proposed meeting date.

I have reviewed your request for an extension to the certification revision period, and am granting this extension request. This extension is being granted for the above referenced certification report and expires thirty (30) days after the meeting between CSC and Ohio EPA.

Printed on Recycled Paper

The revised certification shall follow the format specified in the NOD, and should be submitted to: Ohio Environmental Protection Agency, Division of Hazardous Waste Management, Attn: Pamela Allen, Regulatory and Information Services Section, P.O. Box 1049, Columbus, Ohio 43216-1049. A copy should also be sent to my attention at Ohio EPA, Northwest District Office, 347 North Dunbridge Road, Bowling Green, Ohio, 43402.

Sincerely,

Kara Reynolds

Subject: Revised Certification

Michael,

I received your e-mail concerning the time period in which Campbell Soup Company (CSC) must submit a revised certification. You should receive an official letter from Ohio EPA within the next week or so that explains everything in detail. CSC will have 30 days after the meeting on September 29, 2003 to submit the revised certification to the people specified in the letter.

Please call me if you have any questions or concerns on this issue.

Thank you,

Kara Reynolds

CERTIFIED MAIL

Dr. Osman M. Aly
Environmental Coordinator
Campbell Soup Company
1 Campbell Place
Camden, New Jersey 08103-1799

Re: Former Holding Pit -Notice of Deficiency (NOD)
RCRA Site Closure Certification Report
Campbell Soup Supply Company, Napoleon
OHD 005 419 171

Dear Dr. Aly:

On July 7, 2003, Ohio EPA received from Campbell Soup Company a closure certification report for the former holding pit unit located at 1273 State Route 110, Napoleon, Ohio. Ohio EPA received subsequent submittals from Campbell's on August 6, 2003 and August 12, 2003. The document is titled *RCRA Site Closure Certification Report, Former Holding Pit Unit.*

Ohio EPA, Division of Hazardous Waste Management (DHWM) has conducted a review of the above referenced certification report, and has determined it to be incomplete and technically inadequate.

We have enclosed, as an attachment to this correspondence, detailed deficiency comments on the certification report. Please provide a revised certification report addressing all areas indicated in the deficiency comments. Ohio Administrative Code (OAC) rule 3745-66-12 requires that such a revised certification report be submitted to the Director of Ohio EPA for approval within thirty (30) days of the receipt of this letter.

The revised certification report shall be prepared in accordance with the following editorial protocol or convention:

1) Old Language is over-struck, but not obliterated.

2) New Language is capitalized.

3) Page headers should indicate date of submission.

4) If significant changes are necessary, pages should be re-numbered, table of contents revised, and complete sections provided as required.

Printed on Recycled Paper

The revised certification report should be submitted to: Ohio Environmental Protection Agency, Division of Hazardous Waste Management, Attn: Pamela Allen, Manager, Regulatory and Information Services Section, P.O. Box 1049, Columbus, Ohio 43216-1049. A copy should also be sent to: Kara Reynolds, Ohio EPA, Northwest District Office, 347 North Dunbridge Road, Bowling Green, Ohio, 43402.

If you wish to arrange a meeting to discuss your responses to this Notice of Deficiency, please contact Kara Reynolds, at (419)-373-3065.

Ohio EPA, DHWM, strongly encourages you to consider pollution prevention options for any processes at your facility that generate waste. While implementation of pollution prevention options is not required by Ohio laws and regulations, the application of waste minimization practices may help reduce the expense of remedial activities. Additionally, implementation of pollution prevention options may prevent the creation of new units and as a result eliminate the requirement to submit a closure plan in the future. For assistance in identifying and implementing pollution prevention options, contact Colleen Weaver at (419)-373-3059.

Sincerely,

Michael R. Terpinski
Supervisor
Division of Hazardous Waste Management

let's give them 30 days after the mtg.

>>> Kara Reynolds 09/12/03 07:35AM >>>
So they have basically asked for an extension, and you said that it would be ok. So is there paper work they need to do, or should I just tell them that they have 30 days starting the day that we meet to go over their responses/our comments to get the revised Certification in?

Subject: Re: Certification

Kara,

Any of these days will work for GeoTrans. I will forward the dates to Dr. Aly and get back with you regarding a date and time that will work for Campbell.

We received the Notice of Deficiency on September 8, 2003. The notice states that per OAC rule 3745-66-12, the revised certification report must be submitted to the Director for approval within thirty days of receipt of the letter. Therefore, the revised certification report is due to the Director on October 8, 2003. The earliest available date September 29, 2003 only allows a maximum of 10 business days to revise and submit the certification report. Is a request for an extension possible?

We can determine whether Mylynda should attend the meeting following your review of our response letter. We plan to submit our response letter to you via-email by September 22, 2003.

Sincerely,

Michael Kovacich
Senior Hydrogeologist
GeoTrans, Inc.
(734) 213-5024

>>> "Kara Reynolds" <Kara.Reynolds@epa.state.oh.us> 09/11/03 02:27PM >>>
Hello Michael,

I left a voice mail but thought I would e-mail you also. Michael Terpinski will be out for a while. The best days to meet would be September 29, September 30, October 3 (early like 8:00 AM) October 6, or October 8.

As far as Mylynda Shaskus is concerned, I have not been able to reach her yet. I did, however, want to clear up a few things. I will be reviewing the risk assessment. So if there are general questions about the risk, I will be the one to answer them. If you were looking for Mylynda and your toxicologist to be able to talk and for Mylynda to be able to say "Yes, I do remember saying ...that was ok to do", then I will try my best to set up a time that Mylynda and everyone can make.

I guess I need a little clarifying before I take Mylynda away from her new position.

That's all. Thank You,

Kara Reynolds
Ohio EPA, Northwest District Office
Division of Hazardous Waste Management
347 North Dunbridge Road
Bowling Green, Ohio 43402
(419) 373-3065

APPENDIX II

TIER I CHECKLIST

Data Validation Plan Review Form
Tier I

This Plan Review Form is #		of		forms completed in the review of this closure plan.

Facility Name		Validator/DO	
ID Number		Date of Plan	
Date Review of Plan Completed		Plan is: New, Amended, Revised	
Document Title:			
Lab Name:	Media Type(s):	Analyses Requested:	Notes:

Note: The criteria used in the Tier I Data Validation checklist are derived mostly from SW-846 methods and U.S. EPA's National Functional Guidelines (NFGs). Criteria from methods are considered preferable as they are specific to that procedure. Where the method is silent, criteria from the NFGs, or other sources when necessary, are adopted. For flashpoint (which uses ASTM methods dictated by the OAC rules), ASTM method criteria are used.

The Tier I data validation manual is the primary reference for this checklist. It explains and gives examples for the questions in this checklist. The Tier II methodology and terminology builds on that established in the Tier I checklist and its associated data validation manual. There is no Tier II manual, only the checklist and completed example checklists. Additional information is also available by referring to the specific methods.

Data Qualifiers and their meanings used throughout the Tier I Checklist	
J	Estimated
J+	Estimated High (results are likely reported higher than the true value)
J-	Estimated Low (results are likely reported lower than the true value)
R	Rejected
UJ	Undetected Estimated
NJ	Tentatively Identified, Quantitation Estimated

Section 1.0
Report Completeness and Technical Holding Times

1.1	Sample Package Completeness and Deliverables	
Completeness **This section provides a checklist of important components of data reports. If the report is incomplete, it may be necessary to halt data validation procedures until all the missing information is provided. Please, refer to the Tier I data validation manual for additional assistance in completing the checklist.**		
1.1.1	Describe any discrepancies between the Chain Of Custody (COC) record and submitted sampling data. *Action: If there are discrepancies, contact the laboratory for any missing deliverables and/or an explanation.*	
1.1.2	Is a signed statement from the laboratory present that attests to the validity of the data? *Action: Take no further action and contact the facility and have the lab submit a valid data report. If no response, qualify all data as unuseable.*	
1.1.3	Is a case narrative present that summarizes QA/QC discrepancies and/or other problems? *Action: No action is necessary, but this information is useful to focus data validation efforts.*	
1.1.4	Are COC forms present for all samples? *Action: If not contact the facility for replacement of missing or illegible copies*	
1.1.5	Do the COC forms, Sample Receipt form, or the Case Narrative indicate any problems with the sample receipt, condition of samples, analytical problems or special circumstances affecting the quality of the data? *Action: Use the information to focus data validation efforts.*	
1.1.6	Are Custody Seals present and intact?	

1.1 Sample Package Completeness and Deliverables		
1.7	Is a sample receipt form present? If so, does it contain information on condition of sample containers, proper preservatives used (cross-check with COC) and temperature of the cooler? Note any comments or abnormal conditions. Action may be taken for the following special conditions: A. For samples analyzed for volatiles that were not properly cooled (temperature more than 10°C), all positive results should be qualified as "J" and all non-detects qualified as "UJ." B. For all Volatile Organic Compound (VOC) samples or vials with air bubbles (>2 mm), positive results should be qualified as "J" and non-detects as "UJ" or "R" depending on professional judgment (regarding other quality control information such as sample cooler receipt temperature and other site-specific data quality objectives). C. If aqueous samples for VOCs were not preserved, check that technical holding times were met (see Technical Holding Times, Table 1). If not, qualify all associated sample results. D. If liquid TCLP samples were preserved, qualify all associated results as "R."	

Sample ID	Lab ID	Matrix	Sample Date	Date Received by the Lab	Parameter	Extraction Date	Preparation Date	Analysis Date	QA/QC Data Present[A]	Batch ID#

A: Batch specific QA/QC requirements for Tier I data validation for Organic Data consists of Blank Data Matrix Spike/Matrix Spike Duplicate data, and surrogate data. For Inorganic Data the QA/QC data includes a Matrix Spike and it's duplicate and blank data. Additional QA/QC data may include ICP serial dilution results and post-digestion spike data.

Note: To fill out this table, list one sample ID# then list all sample parameters on one line each with their associated analysis dates, batch ID#s, etc.(*e.g.,* put mercury on a separate line from the other metals since it will have its own prep. dates, analysis dates, and batch ID#s).

1.2 Technical Holding Times

Table 1

Technical Holding Times for Volatile, Semi-Volatile, Metals and pH Samples

Technical holding time is the time, in days, from sample acquisition in the field to either laboratory preparation or analysis. Technical holding times are established from information contained in the laboratory report, chain of custody, and raw analytical bench sheets (if available). Technical holding times also depend upon whether samples were preserved. The recommended technical holding times for volatile compounds, semi-volatile compounds, metals, and TCLP analyses are listed below.

	Preserved	From field collection to extraction	from extraction to preparation	From extraction to analysis	Max Holding Times	Common preservative
VOCs (8260) (aqueous)	Yes	NA	NA	14 days	14 days	Cool to 4° C, HCl
VOCs (8260) (aqueous)	No	NA	NA	7 days	7 days	Cool to 4° C
VOCs (8260) (liquid waste)	No	NA	NA	14 days	14 days	Cool to 4° C
VOCs (8260) (solid/soil/waste)	No	NA	NA	NA	14 days	Cool to 4° C or no preservative
VOCs (EnCore) (5035/8260) (solid/soil/waste)	Yes	2 days	NA	12 days	14 days	Encore Sampler
SVOC(8270)	Yes	7 days	NA	40 days	47 days	Cool to 4° C
Total Metals (6010B/7000)	Yes	NA	NA	180 days	180 days	Nitric Acid (pH<2- aqueous); cool to 4° C - solid samples
Mercury (7470A)	Yes	NA	NA	28 days	28 days	Nitric Acid (pH<2- aqueous); cool to 4° C - solid samples
TCLP VOCs (1311/8260)	No	14 days	NA	14 days	28 days	no preservative
TCLP SVOCs (1311/8270)	No	14 days	7 days	40 days	61 days	no preservative
TCLP Metals (except mercury) (1311/6010B)	No	180 days	NA	180 days	360 days	no preservative

	Preserved	From field collection to extraction	from extraction to preparation	From extraction to analysis	Max Holding Times	Common preservative
TCLP mercury (1311/7470A)	No	28 days	NA	28 days	56 days	no preservative
pH (9040B)	No	24 hours	NA	NA	1 day	no preservative

1.2 Technical Holding Times

Technical Holding Times

Technical holding times are an important component of assuring that data is valid and not biased from inappropriate handling procedures. Technical holding times are judged by assessing the lapsed time from field sampling to extraction and to analyses. There are specific technical holding time requirements for specific classes of compounds. In addition, holding times may vary due to the presence or absence of preservatives. The validator should refer to specific criteria for holding times listed in Table 1 and in the Tier I Data Validation Manual. Use information on sampling, extraction and analysis dates (examined in section 1.0) to determine whether technical holding times are in compliance with criteria listed in Table 1. Complete the following table to determine if any violations of technical holding time exist, and qualify all associated sampling data.

1.2 Technical Holding Times - Volatile Organic Compounds

1.2.1	Are samples properly preserved? Check preservation requirements, chain of custody, and sample receipt form for discrepancies. *Action: Note improprieties and use the information to qualify results.*	List impropriety(-ies):
1.2.2	If samples were improperly preserved, or unpreserved, and the technical holding times were exceeded, qualify all positive results for affected samples as "J" and all non-detected results as "UJ."	List sample ID(s):
1.2.3	If samples were properly preserved, but technical holding times were exceeded, qualify all positive results for affected samples as "J" and all non-detected results as "UJ."	List sample ID(s):
1.2.4	If technical holding times are greatly exceeded (> 2x the time requirement) upon analysis or re-analysis then the validator may use professional judgement to qualify all non-detected compounds as "R" and all positive results as "J."	List sample ID(s):

1.2 Technical Holding Times - Semi-Volatile Organic Compounds		
1.2.5	If technical holding times are exceeded (Table 1), qualify all positive results for affected samples as "J" and all non-detected results as "UJ."	List sample ID(s):
1.2.6	If technical holding times are greatly exceeded (> 2x the time requirement), the validator may use professional judgement to qualify all non-detected compounds as "R" and all positive results as "J."	List sample ID(s):

1.2 Technical Holding Times - Inorganic Compounds		
1.2.7	Are samples properly preserved (4°C for solids; acid preservation for aqueous samples)? Check preservation requirements, chain of custody, and sample receipt form for discrepancies. *Action: Note any impropriety, and use the information to qualify results.*	List impropriety(-ies):
1.2.8	If samples were improperly preserved and the technical holding times were exceeded (Table 1), qualify all positive results for affected samples as "J" and all non-detected results as "UJ."	List sample ID(s):
1.2.9	If samples were properly preserved, but technical holding times exceeded, qualify all positive results for affected samples as "J" and all non-detected results as "UJ."	List sample ID(s):
1.2.10	If technical holding times are greatly exceeded (> 2x the time requirement), the validator may use professional judgement to qualify all non-detected compounds as "R" and all positive results as "J."	List sample ID(s):

1.2 Technical Holding Times - pH		
1.2.11	If technical holding times are exceeded the validator may use professional judgement to qualify data as "R" or "J."	List sample ID(s):

Section 2.0
VOC Data Validation

2.0 VOC Analysis Data Validation	
2.1 Blank Data Summary Review - Volatile Organic Compounds	
Blank Data **Laboratory blanks are used to assess whether contamination from the laboratory, reagents, or other samples exists and whether this contamination can bias sample results. The qualification of sample results will depend upon the magnitude of blank contamination.**	
2.1.1 Is the method blank summary data present for each batch (method and matrix), including TCLP? *Action: If not present, request information from the facility. If the required method blanks were not analyzed, sample results may be qualified as "J," for positive results and "UJ," for non-detected compounds. Qualification should take into account other QA/QC information.*	
2.1.2 Is there an indication that the samples associated with that blank were diluted? **Note: The dilution factor can be found in the data report (a dilution factor of 1 indicates no dilution).**	List the dilution factor(s):
2.1.3 Do any field/trip/rinsate blanks have any positive results for any volatile target analyte? **Note: A list of samples associated with each of the contaminated blanks should be prepared. Field blank results should be used to qualify data. Trip blanks are used to qualify samples based on potential contamination during shipment, and are not required for non-aqueous matrices.** *Action: Follow the directions in the table below to qualify sample results due to contamination. Use the largest value from all of the associated blanks. If any blanks are grossly contaminated, all data associated should be qualified as "R."*	
2.1.4 Do any method blanks for VOCs have positive results for any volatile target analytes? Follow the directions in the table below. **Note: When applied, the contaminant concentration in these blanks are multiplied by the same dilution factor and corrected for % moisture if necessary.**	

For Common Volatile Contaminants: methylene chloride, acetone, 2-butanone	**For Other Contaminants:**	**Action:**
Sample Conc. > Detection Limit but < 10x Blank Result	Sample Conc. > Detection Limit but < 5x Blank Result	Identify the sample result "U" undetected

For Common Volatile Contaminants: methylene chloride, acetone, 2-butanone	For Other Contaminants:	Action:
Sample Conc. < Detection Limit & < 10x Blank Result	Sample Conc. < Detection Limit & < 5x Blank Result	Report the detection limit and qualify result "UJ" estimated undetected
Sample Conc. > Detection Limit & > 10x Blank Result	Sample Conc. > Detection Limit & > 5x Blank Result	No qualification is necessary

2.2 Volatile Organic Data Review - Laboratory Control Sample (LCS)	
Laboratory Control Sample **An LCS should be included with each batch of samples (approximately 20). The LCS consists of an aliquot of a clean (control) matrix similar to the matrix type of the sample and at the same weight or volume. The LCS is spiked with the same analytes at the same concentration as the matrix spike. When the results of the matrix spike indicate a potential problem due to the sample matrix itself, the LCS verifies that the laboratory can perform analyses in a clean matrix (Method 8260B).**	
2.2.1 Was an LCS prepared, extracted, analyzed and reported once per group of 20 samples? **Note: This information should be included in the QA package provided by the lab. If not, contact the laboratory and request that the information be submitted to the agency. This information should be found in the injection log.** *Action: If LCS information cannot be found, consult the facility for re-submittal of the data package. If LCS information is not present, qualify all positive results as "J." If warranted, the Data Validator may reject all results as unacceptable.*	
2.2.2 Does the LCS contain the following volatile target compounds in addition to the required surrogates: 1,1-Dichloroethene Trichloroethene Chlorobenzene Toluene Benzene **Note: Method 8260B calls for the LCS to be spiked at the same level as the matrix spike. When the results of the matrix spike indicate a problem due to sample matrix, the LCS should be checked to determine whether the laboratory can perform the analysis on a clean matrix.**	

2.2 Volatile Organic Data Review - Laboratory Control Sample (LCS)	
2.2.3 Do the percent recoveries (%R) meet the QC limits provided by the lab? *Action: If the LCS recovery is greater than the upper acceptance limit, then positive sample results for the affected compound(s) should be qualified as "J."* *If the mass spectral criteria are met, but the LCS recovery is less than the lower acceptance limit, then the associated detected target compounds should be qualified as "J," and the associated non-detected target compounds should be qualified as "R."* *If more than half of the compounds in the LCS are not within the recovery criteria, then all of the associated detected target compounds should be qualified as "J," and all associated non-detected compounds should be qualified as "R."*	List compounds and sample IDs that do not meet QC limits:
2.2.4 Verify the calculations for at least one %R. *%R = found/true X100* *Action: If the %R is not calculated correctly, verify the other %R calculations and/or contact the lab for re-submittal. If the re-calculated %R values fall within the QC limits, the validator should use professional judgement to determine if the lab should be contacted for re-submittal or if the data should be flagged.*	

2.3 Quality Assurance Summary Review - Matrix Spike/Matrix Spike Duplicates, VOC	
Matrix Spike/Matrix Spike Duplicates **Matrix spike and matrix spike duplicates are performed to assess method precision for VOC and SVOC analyses. Matrix spikes and duplicates are required for every batch of samples (every 20 - 30 samples). The validator should be aware that the MS/MSD are batch specific, not sample specific. For example, the MS/MSD information may be any sample in the batch, but not necessarily a sample being validated. Because of this, matrix spike and matrix spike duplicate data alone usually aren't used to qualify results, but the information is used with other QA/QC data to qualify data.**	
2.3.1 Is matrix spike/matrix spike duplicate recovery data present? *Action: If any matrix spike data is missing, the laboratory should be contacted for a re-submittal.*	
2.3.2 How many VOC spike recoveries are outside the QC limits?	Record the spike recovery and control limits:
2.3.3 How many RPDs for matrix spike and matrix spike duplicate recoveries are outside the QC limits for VOCs? **Note: The MS/MSD results may be used in conjunction with other QC criteria to determine the need for data qualification. Outliers should be identified.**	Record the recovery data out of criteria and control limits. Review surrogate and LCS data to determine if qualifiers are necessary:

2.4 VOC Surrogate Recovery

VOC Surrogate Compound Recovery

Surrogate compounds are spiked compounds of known composition that are added to samples and blanks. The recovery of surrogate compounds allows an assessment of matrix interference. VOC surrogate recoveries are used with other QA/QC data to qualify sample results and to justify laboratory re-analysis. Specific examples are listed in the data validation guidance document.

Surrogate Compound	Water *	Soil/Sediment *
4-Bromofluorobenzene	86-115	74-121
Dibromofluoromethane	86-118	80-120
Toluene-d_8	88-110	81-117
1,2-Dichloroethane-d_4	80-120	80-120

Other Common VOC Surrogates
1,2-Dichlorobenzene-d_4
Pentafluorobenzene
Fluorobenzene

*** SW-846 Method 8260B, Table 8. Acceptance criteria is guidance.**

2.4.1 Are the surrogate recovery data present for each batch (method and matrix), including TCLP? **Note: Samples may be included in separate sample batches and separate surrogate recoveries should be provided.** *Action: If no, contact the laboratory for explanation and re-submittals.*	
2.4.2 Were any outliers marked correctly (based upon the laboratory's criteria)? *Action: Mark, circle or highlight the suspected outliers.*	List the sample ID(s), matrix(-ces) and parameter(s):
2.4.3 If any surrogate compound was out of compliance was re-analysis performed to confirm a matrix interference? **Note: Check the report narrative for an indication of re-analysis. Additionally, qualification may not be appropriate for TCLP data. Best professional judgement may be used to qualify data.** *Action: If a surrogate is above the upper control limit, all positive results should be qualified as "J." Results listed as non-detected should not be qualified.* *If any surrogate recovery is less than the lower criteria, but greater than or equal to 10% recovery, all detected compounds should be qualified as "J" and all non-detected compounds as "UJ."* *If any surrogate recovery is less than 10%, all detected compounds should be qualified as "J" and all non-detected compounds as "R."*	List sample ID(s) for surrogate compounds out of compliance and criteria:

3.0 SVOC Analysis Data Validation	
3.1 Blank Data Summary Review - Semi-Volatile Compounds	
Blank Data **Laboratory blanks are used to assess whether contamination from the laboratory, reagents, or other samples exists and whether this contamination can bias sample results. The qualification of sample results will depend upon the magnitude of blank contamination.**	
3.1.1 Is the method blank summary data present for each batch (method and matrix), including TCLP? *Action: If not present, request information from the facility. If information exists that the required method blanks were not analyzed, then sample results may be qualified as "J," for positive results and "UJ" for non-detected compounds. Qualification should take into account other QA/QC information.*	
3.1.2 Is there an indication that samples, associated with that blank, were diluted? **Note: The dilution factor can be found in the data report (a dilution factor of 1 indicates no dilution).**	List the dilution factor(s):
3.1.3 Do any field/rinsate blanks have any positive results for any semi-volatile target analyte? **Note: A list of samples associated with each of the contaminated blanks should be prepared. Field blank results should be used to qualify data. Trip blanks are used to qualify only samples based on shipment and are not required for non-aqueous matrices.** *Action: Follow the directions in the table below to qualify sample results due to contamination. Use the largest value from all of the associated blanks. If any blanks are grossly contaminated, all data associated should be qualified as "R."*	
3.1.4 Do any method blanks for SVOCs have positive results for any semi-volatile target analytes? Follow the directions in the table below. **Note: When applied, the contaminant concentration in these blanks are multiplied by the same dilution factor and corrected for % moisture if necessary.**	

For Common Semi-Volatile Contaminants: Phthalate esters	**For Other Contaminants:**	**Action:**
Sample Conc. > Detection Limit but < 10x Blank Result	Sample Conc. > Detection Limit but < 5x Blank Result	Identify the sample result "U" undetected
Sample Conc. < Detection Limit & < 10x Blank Result	Sample Conc. < Detection Limit & < 5x Blank Result	Report the detection limit and qualify result "UJ" estimated undetected

For Common Semi-Volatile Contaminants: Phthalate esters	For Other Contaminants:	Action:
Sample Conc. > Detection Limit & > 10x Blank Result	Sample Conc. > Detection Limit & > 5x Blank Result	No qualification is necessary

3.2 Semi-Volatile Data Review - Laboratory Control Sample (LCS)	
Laboratory Control Sample **An LCS should be included with each batch of samples (approx. 20). The LCS consists of an aliquot of a clean (control) matrix similar to the matrix type of the sample and at the same weight or volume. The LCS is spiked with the same analytes at the same concentration as the matrix spike. When the results of the matrix spike indicate a potential problem due to the sample matrix itself, the LCS verifies that the laboratory can perform analyses in a clean matrix (Method 8270C).**	
3.2.1 Was an LCS prepared, extracted, analyzed and reported once per group of 20 samples (per batch)? **Note: This information should be included in the QA/QC package provided by the lab. If not, contact the laboratory and request that the information be submitted to the agency.** *Action: If LCS information is not present, consult the facility for re-submission of the data package. If LCS information is not available, qualify all positive results as "J." If warranted, the Data Validator may reject all results.*	
3.2.2 Does the LCS contain the following semi-volatile target compounds in addition to the required surrogates? Base/Neutrals 1,2,4-Trichlorobenzene Acenaphthene 2,4-Dinitrotoluene Pyrene N-Nitroso-di-n-propylamine 1,4-Dichlorobenzene Acids Pentachlorophenol Phenol 2-Chlorophenol 4-Chloro-3-methylphenol 4-Nitrophenol **Note: Method 8270C calls for base/neutral compounds to be spiked at 100 µg/L and acid compounds to be spiked at 200 µg/L. However, for waste samples the concentration should be 5 times higher.**	

3.2 Semi-Volatile Data Review - Laboratory Control Sample (LCS)	
3.2.3 Do the percent recoveries (%R) meet the QC limits provided by the lab? *Action: If the LCS recovery is greater than the upper acceptance limit, then positive sample results for the affected compound(s) should be qualified as "J."* *If the mass spectral criteria are met, but the LCS recovery is less than the lower acceptance limit, then the associated detected target compounds should be qualified as "J," and the associated non-detected target compounds should be qualified as "R."* *If more than half of the compounds in the LCS are not within the recovery criteria, then all of the associated detected target compounds should be qualified as "J," and all associated non-detected compounds should be qualified "R."*	**List compounds and sample IDs that do not meet QC limits:**
3.2.4 Verify the calculations for at least one %R. *%R = found/true X100* *Action: If the %R is not calculated correctly, verify the other %R calculations and/or contact the lab for re-submission. If the recalculated %R values fall within the QC limits, the Data Validator should use professional judgement to determine if the lab should be contacted for re-submission or the data should be flagged.*	

3.3 Quality Assurance Summary Review - Matrix Spike/Matrix Spike Duplicates, SVOC
Matrix Spike/Matrix Spike Duplicates **Matrix spike and matrix spike duplicates are performed to assess method precision for VOC and SVOC analyses. Matrix spikes and duplicates are required for every batch of samples (every 20 - 30 samples). The validator should be aware that the MS/MSD are batch specific, not sample specific. For example, the MS/MSD information may be any sample in the batch, but not necessarily a sample being validated. Because of this, matrix spike and matrix spike duplicate data alone usually aren't used to qualify results, but the information is used with other QA/QC data to qualify data.**

3.4 SVOC Surrogate Recovery	
SVOC Surrogate Compound Recovery **Surrogate compounds are spiked compounds of known composition that are added to samples and blanks. The recovery of surrogate compounds allows an assessment of matrix interference. SVOC analyses include compounds that can be divided into two classes: acid compounds and base/neutral compounds. Each class has a specific assigned set of surrogate compounds. The list of compounds can be found in the data validation guidance manual or SW-846, Method 8270. Data validation is also based upon the type of compound being analyzed. SVOC surrogate recoveries also are used to justify re-analysis to confirm matrix interference, but the number of surrogate compounds out of compliance will justify qualification. Specific examples are listed in the data validation guidance document.** **Surrogate Compound** — **Fraction** **phenol-d_6** — **Acid** **2-fluorophenol** — **Acid** **2,4,6-tribromophenol** — **Acid** **nitrobenzene-d_5** — **Base/Neutral** **2-fluorobiphenyl** — **Base/Neutral** **p-terphenyl-d_{14}** — **Base/Neutral**	
3.4.1 Are the surrogate recovery data present for each batch (method and matrix), including TCLP? **Note: Samples may be included in separate sample batches and separate surrogate recoveries should be provided.** *Action: If no, contact the laboratory for explanation and re-submittals.*	
3.4.2 Were any outliers marked correctly? *Action: Mark, circle or highlight the suspected outliers.*	List the sample ID(s), matrix(-ces) and parameter(s):
3.4.3 If any TWO surrogate compounds in either the acid or base/neutral classes were out of compliance, was re-analysis performed to confirm a matrix interference? **Note: Check the report narrative for an indication of re-analysis.** *Action: If no information is present, request information from the facility.*	List sample ID(s) for surrogate compounds out of compliance and criteria:
3.4.4 If any ONE surrogate compound has a recovery of less than 10% in either the acid or base/neutral classes, check for indications that re-analysis was performed to confirm a matrix interference? **Note: Check the report narrative for an indication of re-analysis.**	List sample ID(s) for surrogate compounds out of compliance and criteria:

4.0 Metals Analysis Data Validation	
4.1 Blank Data Summary Review - Metals Data	
Blank Data **Laboratory blanks are used to assess whether contamination from the laboratory, reagents, or other samples exists and whether this contamination can bias sample results. The qualification of sample results will depend upon the magnitude of blank contamination.**	
4.1.1 Is the method/prep blank summary data present for each batch (method and matrix), including TCLP? *Action: If not present, request information from the facility. If the required method blanks were not analyzed, sample results may be qualified as "J" for positive results and "UJ" for non-detected compounds. Qualification should take into account other QA/QC information.*	
4.1.2 If metals are detected in the blank, record the IDs of the affected samples and those metals detected above the detection limit in the blank and all positive results from the samples. Attach this summary page to this checklist. *Action: Positive sample results that are greater than the detection limit but less than 5 X the blank results should be qualified as "UJ." If the blank is severely contaminated, the corresponding positive sampling results may be qualified as "R."*	
Blanks- Mercury	
4.1.3 Was a Method blank included per batch and were the results below the reporting limit or the CRDL (for CLP labs)?	
4.1.4 Did any Method Blanks contain concentrations of mercury above reportable levels? Were these flagged? **Note: If mercury is discovered in the method blank above the reporting limit, the lowest concentration of any sample in that batch must be 10 times the method blank concentration. If this is not the case, all samples in that batch should have been re-digested and re-analyzed.** *Action: Review the blank data. If the sample results are positive but less than 5 times the concentration in the blank, the results should be qualified as "U".* *If the sample results are positive and greater than 5 times the blank concentration, but less than 10 times the blank concentration, the results should be qualified as "J".*	

4.2 Metal Spike Recovery	
Metal Spike Recovery **Spikes are elements of known composition that are added to blanks and to samples that measure accuracy and precision of the analyses. At least one spike (termed a matrix spike or prep spike) should be included for each batch of samples. Spike recovery criteria listed in this section are determined from U.S. EPA's National Functional Guidelines for Inorganic Data Review. The criteria applied by an individual laboratory may vary. The laboratory should be consulted and it's QA/QC criteria supplied to the validator.**	
4.2.1 Confirm that at least one pre-digestion spiked sample was analyzed per batch, matrix type and concentration or sample delivery group? *Action: If not present, contact the facility for re-submittal.*	
4.2.2 Are all spike recoveries (except Hg and Ag) within control limits (e.g., 75% to 125%)? **Note: When the spike sample result is less than the instrument detection limit, the percent recovery calculation should use a value of zero (not the detection limit) for the sample result.** *Action: Is the sample concentration ≥ 4 times the spiked concentration? If yes, disregard spike recoveries for analytes whose concentrations in samples are > 4 times the spike added. If no, circle those analytes whose concentration is < 4 times the spike added.*	List those elements out of control:
4.2.3 Based on the results of 4.2.2, if the sample results were <4x the spike amount and spike recoveries were out of criteria, a post-digestion spike should be analyzed. **Note: Post-digestion spikes are not required for Ag or Hg, however, one typically is run if the LCS was out of control. The post digestion spike confirms a matrix interference and should not be used for qualification** *Action: Contact the facility/laboratory for an explanation if a post-digestion spike was not analyzed. If none are available, use professional judgement to qualify sample results.*	
4.2.4 Were concentrations in the digestate reported in ug/L for aqueous samples and mg/kg on the basis of dry weight for soil samples?	

4.2 **Metal Spike Recovery**	
4.2.5 Are any **aqueous** spike recoveries (pre and post digestion): 1. Less than 30%? 2. Between 30% and 74%? 3. Between 126% and 150%? 4. Greater than 150%? **Note: The TCLP extract should be handled as an aqueous sample.** *Action: If < 30%, and the sample results are below the detection limit, all data should be qualified as "R."* *If between 30% and 74%, qualify all positive data as "J" and non-detected data as "UJ."* *If between 126% and 150%, qualify positive as "J." All undetected compounds are acceptable.* *If > 150% note for possible positive bias. Evaluator may qualify data "R" based on professional judgement and the eventual end use of the data.*	
4.2.6 Are any **soil/solid/waste** spike recoveries (pre and post digestion): 1. Less than 10%? 2. Between 10% and 74%? 3. Between 126% and 200%? 4. Greater than 200%? *Action: If < 10%, those elements out of control limits should be qualified as "R."* *If between 10% and 74%, qualify those elements out of control limits as "J."* *If between 126% and 200%, qualify positive data, for those elements out of control limits, as "J."* *If > 200%, qualify all positive data, for those elements out of control limits, as "R."*	
4.2.7 If the pre-digestion spike was outside the QC limits for **Atomic Adsorption furnace analysis** (e.g., SW-846 methods in the 7000 series), was a post-digestion spike performed? *Action: Samples should not be qualified based on post-digestion spike results. The results are used to confirm a matrix interference. If a post-digestion spike was not prepared, the data validator may reject the data.*	
4.2.8 Based on the results from 4.2.7, were the post-digestion spike recoveries within the quality control range (75% to 125%)? *Action: If > 125%, qualify all positive data as "J." If < 75%, qualify both positive and non-detect data as "J."*	

4.3 Quality Assurance Data Review - Inorganic Analysis - AA Analysis	
Graphite Furnace Atomic Adsorption QC Atomic Adsorption analyses require specialized QA/QC procedures that may be different than Inductively Coupled Plasma (ICP) Emission Analysis. Commonly, AA analysis is performed for mercury and selenium. Mercury analysis data validation is specifically detailed in the Inorganics Section of the Tier II Checklist. The Tier I Data Validator is directed to the Agency's Data Validation Review Manual and to specific methods detailed in SW-846. In general, external calibration procedures are commonly required by the method. In addition, duplicate injections and multiple concentration post-digestion spikes are required to establish precision and accuracy data.	
4.3.1 Were duplicate injection of samples performed and if so, were the duplicates within ± 20% RPD for samples with concentrations above the detection limit? **Note: Results are reported based upon the average of duplicate injections. If the acceptance criteria is not met, the sample should have been re-analyzed (i.e., with at least two additional injections).** *Action: If RSD criteria is not met or the sample was not rerun, qualify all positive data as "J."*	List sample IDs and appropriate method and calculated RPD:
4.3.2 If the samples were re-analyzed (*i.e.*, 2 more injections), do the duplicate injections agree within 20% RSD? *Action: If the RSD criteria is not met, qualify all positive results as "J."*	No. _____ Yes. _____. List sample IDs and appropriate method and calculated RSD.
4.3.3 Were Matrix Spike/Matrix Spike Duplicates analyzed at a rate of 1 in 20 or per batch? *Action: If no MS/MSD were analyzed, qualify all positive results as "J" and all undetected results as "UJ."*	

4.4 Spikes - Mercury Analysis

4.4.1 Was a Matrix Spike analyzed at required frequency (one pre-digestion for each group of samples with a similar matrix type and concentration or sample delivery group) and within limits? **Note: Post-digestion spikes are not required for Mercury. However one typically is run if the LCS was out of control in order to show matrix interference.** *Action: If the spike recovery is greater than 125 % and the sample results are below the detection limit, the data is acceptable.* *If the spike recovery is greater than 125% or less than 75%, and the sample results are greater than the detection limit, then the positive data should be qualified as "J."* *If the spike recovery falls within the range of 30 to 74%, all non-detected data should be qualified as "UJ."* *If the spike recovery is less than 30% and the sample results are below the detection limit, qualify these results as "R."*	
4.4.2 If the analyte concentration in the original sample is a factor of 50 above the IDL, was a serial dilution analysis performed and did it agree within a 10% difference of the original determination after correction for dilution?	
4.4.3 Was an LCS analyzed per batch and within QC limits (80 to 120%)? (An LCS is not required for aqueous samples of Mercury.) **Note: The results for solid LCS should always be within the control limits. The laboratory should terminate the analysis, correct the problem, and the samples should be re-digested and re-analyzed for mercury.** *Action: If the LCS is outside of the control limit, qualify all positive results as "J."* *If the LCS results are higher than control limits and the sample results are below the detection limit, the results are acceptable.* *If the LCS result is below the lower control limit, qualify all results below the detection limit as "UJ."*	

Section 5.0
Characteristic Tests

5.1 TCLP Preparation and TCLP Spike Recovery
Toxicity Characteristic Leaching Procedure The toxicity characteristic leaching procedure (TCLP) is used to determine whether wastes exhibit the toxicity characteristic or whether Land Disposal Restrictions have been met. The TCLP test is specified in OAC 3745-51-24 and defined in SW-846, Method 1311. TCLP data validation requires specific data concerning extraction preparation in addition to the usual data submitted for organic and inorganic analytical methods. In most cases, a laboratory will have to supply bench sheet data to complete data validation. The validator should consult the Tier I Data Validation Guidance Manual for specific information and examples.

5.1 TCLP Preparation and TCLP Spike Recovery	
5.1.1 Did the laboratory calculate TCLP filterable solids? Based on the percent solid calculations, were the correct analytical procedures followed? **Note: TCLP requires that solid waste, semi-solid waste and liquid wastes be prepared based upon the amount of solids in the waste. For waste that has greater than 99.5% solids, the waste is considered solid and a 100 grams of material is extracted with 20 times this weight of extraction fluid. For waste that is equal to or less than 0.5% solids, the waste is considered a liquid and the liquid itself is considered the extract (no additional extraction fluid or tumbling is necessary). If the waste contains both solids and liquids, the solid portion, trapped by filtering, is extracted with 20 times it's weight of extraction fluid and then analyzed. In addition, an aliquot of the liquid is analyzed. The results are then mathematically combined.** *Action: If percent solids were not calculated contact the facility for the proper information.* *If, based on the percent solids calculations, the appropriate preparation methods were not used, qualify analytical results using the following criteria:* *All positive results above the regulatory level should not be qualified.* *All positive results above the detection limits but below the regulatory level should be qualified based on professional judgement and the specific circumstances. You may want to speak with your Tier II validator.* *All non-detected results should be qualified based on professional judgement and the specific circumstances.*	

5.1 TCLP Preparation and TCLP Spike Recovery	
5.1.2 Was the proper amount of material extracted? **Note: For waste samples to be analyzed for metals or SVOCs (in the solid portion), a minimum of 100 grams is required. For waste samples to be analyzed for volatile compounds, approximately 20-25 grams of sample is required.** **Note: Liquid samples are directly analyzed as the TCLP extract, no extraction fluid is added to the sample.** *Action: If improper sample mass is used, qualify analytical results using the following criteria:* *All positive results above the regulatory level should not be qualified.* *All positive results above the detection limits, but below the regulatory level should initially be qualified as "J" estimated. Based on professional judgement, qualification of data as "R" may be warranted.* *Based on professional judgement, all non-detected results should be qualified as "J" estimated or "R."*	List sample IDs and sample mass(es) used for the extraction:
5.1.3 Was the correct extraction fluid used? **Notes:** **Fluid # 1 is <u>always</u> used for VOC analysis.** **Fluid #1 should be used if the final pH of the pre-test sample is below 5.0.** **If the pH is above 5.0, hydrochloric acid should be added to the pre-test sample (refer to the method for specifics).** **Re-analyze for pH.** **Fluid #1 should be used if the final pH of the pre-test sample is below 5.0.** **Fluid #2 should be used if the final pH of the pre-test is above 5.0.** *Action: Consult with the facility and have the extraction fluid information submitted. If the improper fluid is used, qualify analytical results using the following criteria:* *All positive results above the regulatory level should not be qualified.* *All positive results above the detection limits, but below the regulatory level, should initially be qualified as "J." Rejection of data may be warranted if other preparatory procedures are outside of criteria.* *All non-detected results should be qualified as "R."*	List sample IDs and fluid type(s) used for the extraction:

5.1 TCLP Preparation and TCLP Spike Recovery	
5.1.4 Did the extraction fluid have the proper pH? Fluid #1 has a pH range of 4.88 to 4.98 Fluid #2 has a pH range of 2.83 to 2.93. *Action: If an improperly prepared extraction fluid is used, qualify analytical results using the following criteria:* *All positive results above the regulatory level should not be qualified.* *All positive results above the detection limits, but below the regulatory level, should initially be qualified as "J." Rejection of data may be warranted if other preparatory procedures are outside of criteria.* *All negative results should be qualified as "R."*	List incorrect fluid pH(s):
5.1.5 Was the correct weight of extraction fluid used? Laboratory bench sheets may be needed to complete this section. **Note: For waste that has greater than 99.5% solids, the waste is considered solid, and 100 grams of material are extracted with fluid 20 times this weight. For waste that is equal to or less than 0.5% solids, the waste is considered a liquid, and the liquid itself is considered the extract (no additional extraction fluid or tumbling is necessary). If the waste contains both solids and liquids, the solid portion, trapped by filtering, is extracted with fluid 20 times its weight. This extract can either be physically recombined with the liquid portion for analysis, or the estract and liquid portions can be analyzed separately and those results conbined mathematically.** *Action: The extraction fluid weight should be within 85 - 115% of the correct value (2000 grams for metals; 500 grams for VOCs). These values may be re-qualified if additional problems with TCLP preparation exist.* *If the extraction fluid weight is within 70 - 85% or 115 - 130% of the correct value, qualify all results as "J."* *If the extraction fluid weight is 0 - 70% of the proper weight, qualify all results as "R."* *If the extraction fluid weight is greater than 130% of the proper weight, qualify all non-detected compounds, and positive results below the regulatory level, as "R." All positive results above the regulatory limit should not be qualified.*	

5.1 TCLP Preparation and TCLP Spike Recovery	
5.1.6 Was a TCLP blank analyzed with every batch of samples? **Note: TCLP blanks should be prepared using the same extraction fluid as is used for the associated sample's extraction.** *Action: Contact the facility for submittal of missing data. If no blank was analyzed, qualify all positive results as "R." If data is available, qualify TCLP data as designated in Section 4.0 Blank Data Summary Review*	List IDs of affected samples:
5.1.7 Was the tumbling time within 18 +/- 2 hours? **Note: Tumbling time (evaluated based on the day and time tumbling begins/is completed) should be noted on the bench sheets. The laboratory should be contacted if this information isn't present.** *Action: If the tumbling time is not within 18 +/- 2 hours, qualify all data as "J."*	
5.1.8 Was the tumbler speed within 30 +/-2 RPM? **Note: Tumbler speed should be noted on the bench sheets. The laboratory should be contacted if this information isn't present.** *Action: If the tumbler speed is not within 30 +/-2 RPM, qualify all data as "J."*	

VOC, SVOC and Metal results from the TCLP test should meet the sample QA/QC criteria outlined in Sections 1.0 through 4.0.

5.2 Ignitability
Ignitability **The two testing methods that may be used to determine this hazardous waste characteristic are SW-846 Method 1010 (Pensky-Martens Closed Cup, also ASTM D93-90 or D93-77) and Method 1020 (SETAFlash Closed Cup and ASTM D3828-93). Method 1020A is used for liquids that have lower viscosities and flashpoints between 0 °C and 110 °C.** **Method 1010 is the flashpoint method most often used by DHWM. It is used for "fuel oils, lube oils, suspensions of solids, liquids that tend to form a surface film under test conditions, and other liquids." For us, this includes things like paint wastes, parts cleaners, etc. To test the flash point, "the sample is heated at a slow, constant rate with continual stirring. A small flame is directed into the cup at regular intervals with simultaneous interruption of stirring. The flash point is the lowest temperature at which application of the test flame causes the vapor above the sample to ignite." Method 1010 has two options, termed "A" and "B". Method A, the basic procedure, is used unless the material being tested is a suspension of solids or a highly viscous material. Those materials require the use of Method B. There are specific requirements and apparatus for method 1010 that are not included in this check list. These items include recording of barometric pressure, thermometers, stirrer rates, wind shields and drying of wastes that contain free water. If necessary, specific testing requirements that are used should be discussed with the laboratory and appropriate qualifications of the data should be made.**

5.2 Pensky-Martens (SW-846, Method 1010) - Method A		
5.2.1	Was p-xylene used to calibrate the instrument?	
5.2.2	Was the flashpoint for the calibration standard p-xylene within 81± 6 °F?	Record the p-xylene calibration flashpoint(s):
5.2.3	If the calibration standard was outside of this range (see 6.1.2), was corrective action taken? *Action: If no corrective measures were performed, determine whether a significant bias has been imparted to the samples and qualify the results using professional judgement. If sample is still available, notify the laboratory. Consult Tier II evaluator regarding request re-analysis.*	Record IDs of samples that are qualified:
5.2.4	Based on 6.1.3, if corrective measures were taken, was the p-xylene calibration flashpoint within 81± 2 °F? **Note: Corrective measures should have continued until this flashpoint calibration range was attained.** *Action: If these procedures were not followed and documented, contact the laboratory for an explanation. Lack of an adequate explanation may justify qualifying the data.*	
5.2.5	If a sample has an expected flashpoint, based on field/facility information, measurements should begin at least 30-50° F below the expected flashpoint of the material. If the expected flashpoint is unknown, the initial measurements should begin at the ambient temperature of the laboratory. *Action: If these procedures were not followed and documented, contact the laboratory for an explanation. Lack of an adequate explanation may justify qualifying the data.*	

Attachment A - Comments

The following comments are divided into three categories: comments regarding the RCRA Site Closure Certification Report, Former Holding Pit Unit (Certification); comments regarding the Revised Closure Plan Approval Letter dated August 1, 2002; and comments regarding the Residual Risk Calculation in the Certification.

The following comments concern the RCRA Site Closure Certification Report, Former Holding Pit Unit (Certification).

1 **General.** To facilitate Ohio Environmental Protection Agency's (Ohio EPA) review of the Certification, Campbell Soup Company (CSC) shall address all of Ohio EPA's comments contained in this letter and submit the revised document, in its entirety, to Ohio EPA. This document shall follow the editorial protocol outlined in the preceding letter.

2 **General.** Throughout the Approved Closure Plan (Plan) and Certification, CSC utilizes the word "clean" to describe a portion of the soil at the CSC site. This can be found in the following:

a. Plan, Section 16.1, Final Cover System Construction and Testing Requirements, page 41.
b. Certification, Section 3.3, Initial Soil Excavation, page 10.
c. Certification, Table 3a, Summary of VOC Composite Clean Soil Stockpile Samples.
d. Certification, Table 3b, Summary of SVOC Composite Clean Soil Stockpile Samples.

Ohio EPA believes that this wording is inaccurate. Ohio EPA defines "clean" soil as soil that has not been impacted by any unit or site operations. CSC shall revise the Certification to clarify that CSC's definition of "clean" soil is soil that meets risk-based clean closure levels.

3 **Certification Section 2.8, Surface Water Sampling, Page 6-7.** CSC states that "Surface water was not observed to seep out of the elevated area at any time during site investigation nor during the soil remediation. Therefore, surface water samples were not collected as outlined in Section 14.2 of the Closure Plan." However, in the Plan, Section 14.2, Surface Water Sampling Plan, page 33, it states that "If no water is observed during field work, surface water samples will be collected from the on-site ditch, north of the mounded area. Ditch samples will be collected at the nearest point to the unit, at a location 100 yards up-stream from this point, and at a location 100 yards down-stream from this point." CSC shall follow Section 14.2 of the Plan, sample the on-site ditch as outlined, and submit the laboratory data to Ohio EPA within 30 days of receipt of this letter. CSC shall also revise the Certification to include the additional sampling and all corresponding information/data from the sampling.

4 **Certification Section 3.2, Soil Sampling Methods, Page 10.** CSC explains that the labels of the sample containers included "sample identification, sample date and time, parameter(s) for analysis, and person collecting the sample." However, the Plan states in Section 14.8, Sample Handling and Analysis, page 39, that each sample "will have a label to record... sample depth,..." CSC shall revise the Certification to include an explanation as to why sample depth was not included on the labels and will include each sample depth on all samples taken.

5 **Certification Section 3.3, Initial Soil Excavation, Page 10.** CSC explains that only some of the soil, the most heavily contaminated, was treated by the Medium Temperature Thermal Desorption (MTTD). Soil that was labeled "clean" according to the Photo Ionization Detector (PID) readings, was not necessarily treated by the MTTD, even though samples from the "clean" soil contain contamination. In Section 7.0, Removal of Hazardous Wastes and Soil Remediation, page 21 of the Plan, it states that "Soil identified as contaminated will be moved to the pre-remediation staging area for immediate treatment." Also, in Section 14.5, Remediation Verification, page 35 of the Plan, it states that "All contaminated excavated soil will be transported to the on-site MTTD for treatment." CSC shall revise the Certification to explain the reasoning behind the altered methodology in the closure.

6 **Certification Section 3.3, Initial Soil Excavation, Page 10.** The Certification defines the classifications of contaminated soil based on the PID readings. Those classifications are as follows:

a. "Soils that exhibited PID concentrations less than 10 ppm were characterized as 'suspected clean.'"
b. "Soils that exhibited PID concentrations less than 100 but higher than 10 ppm were characterized as 'intermediate.'"
c. "Soils that exhibited PID concentrations greater than 100 ppm were characterized as 'impacted.'"

However, the Certification does not define which classification a PID reading of exactly 10 parts per million (ppm) or exactly 100 ppm would constitute. CSC shall revise the Certification to include the classifications of the PID reading "10 ppm" and "100 ppm." CSC shall also include a list of any samples that exhibited a PID reading of "10 ppm" or "100 ppm" and the fate of such samples.

7 **Certification Section 3.3, Initial Soil Excavation, Page 10-11.** The last paragraph on page 10 is not clear. Ohio EPA believes the units are not consistent. Ohio EPA does not understand the correlation between the 100 cubic yard sample grids and the 100 ton sample grids. CSC shall revise the Certification to clarify the discrepancy in this section.

8 **Certification Section 3.3, Initial Soil Excavation, Page 10 and Certification Section 3.4, Impacted Soil Excavation, Page 11.** The Certification does not include an explanation of the methodologies used to determine the depth of the excavation. Also, the Certification does not provide assurance that the samples found to possess contamination were adequately excavated to the corresponding sample depth. CSC shall revise the Certification to include the methodologies used to determine the depth of the excavation and assurance that the corresponding depth was excavated and treated properly. CSC shall provide proof in the Certification that the samples proposed to be excavated actually were excavated. CSC shall also revise the Certification to include the depths of the excavation relative to the sample depths. For example, if sample X-Y-Z has a sample depth of 12 feet, laboratory analysis shows lead contamination in X-Y-Z, and CSC proposed to excavate and treat sample X-Y-Z, then CSC needs to provide assurance that soil was excavated to at least 12 feet at sample point X-Y-Z.

9 **Certification Section 3.3, Initial Soil Excavation, Page 10 and Certification Section 3.4, Impacted Soil Excavation, Page 11.** The Plan describes in Section 7.0, Removal of Hazardous Wastes and Soil Remediation, page 21, that "All soils within the areas delineated for the second and third stages of excavation will be considered impacted, and immediately transported to the MTTD soil treatment staging area." In the same section CSC defines these stages as "second stage... between 680 and 675 feet MSL...third stage...between 675 and 670 feet..." CSC has shown no proof or given any assurance that this took place during the closure. CSC shall revise the Certification to include assurances that this portion of the Plan was followed. If CSC did not follow the Plan, then a detailed explanation of the methods utilized in place of this section shall be included in the Certification.

10 **Certification Section 4.2, Confirmation Sampling, Page 16.** CSC explains that "Twenty-four confirmation samples were collected from the floor and sidewalls: fourteen were from planned locations, five were repeats of the planned sample locations..., and five others were investigative in nature..." The Plan states in Section 14.6.3, Sampling of Grid, page 37, that "Twenty (20) soil samples will be collected..., ...six (6) samples will be held.

If sampling abnormalities exist... then the held samples will be analyzed..." CSC shall revise the Certification to explain the reason samples were not held as previously outlined in the Plan.

11 **Certification Section 4.7, Vertical Site Delineation, Page 19.** CSC states in the Certification that to complete the vertical delineation of Volatile Organic Compounds (VOCs), "...four locations were chosen within the excavations where the floor confirmation samples reported non-detectable concentrations of VOCs. To obtain the second vertical sample, deeper pits were dug at these locations..." The Certification does not explain what was done with the excavated soil for the test pits. CSC shall revise the Certification to explain what happened to this soil.

12 **Certification Section 4.7, Vertical Site Delineation, Page 19.** CSC states in the Certification that to complete the vertical delineation of VOCs, "...four locations were chosen within the excavations where the floor confirmation samples reported non-detectable concentrations of VOCs. To obtain the second vertical sample, deeper pits were dug at these locations..." It is common practice to randomly choose the sites where vertical delineation samples will be taken. CSC will revise the Certification to explain the methodology of picking the non-detectable (ND) samples and not randomly selecting the sample locations.

13 **Certification Section 4.7, Vertical Site Delineation, Page 19.** CSC states in the Certification that to complete the vertical delineation of VOCs, "...four locations were chosen within the excavations where the floor confirmation samples reported non-detectable concentrations of VOCs. To obtain the second vertical sample, deeper pits were dug at these locations..." This does not follow the sampling plan outlined in the Plan, Section 14.7, Site Delineation Sampling Plan, page 38, which states that "Geoprobe borings will be advanced in a minimum of four locations throughout the site excavation. At each boring location a minimum of two consecutive vertical soil samples will be collected." CSC shall revise the Certification to explain the reason the Plan was not followed.

14 **Certification Section 4.7, Vertical Site Delineation, Page 19 and Certification Figure 6, Final Confirmation Samples and Final Extent of Excavation.** In this section, CSC lists the floor samples and corresponding test pit samples used for the VOC vertical site delineation of contamination. In Figure 6, it appears that the floor samples and test pit samples are not positioned in the same area. For example, Test Pit #1 (TP-1) corresponds with Floor Sample #18 (FL-18), which appears to be approximately 30 feet away. CSC shall revise the Certification to include an explanation for the horizontal distance between the test pit samples and floor samples.

15 **Certification Tables.** The following tables do not include the depth of the sample.

a. Table 4a, Summary of VOC Intermediate Soil Stockpile Samples.
b. Table 7a, Summary of VOC Confirmation Floor Samples.
c. Table 7b, Summary of SVOC Confirmation Floor Samples.
d. Table 8a, Summary of VOC Confirmation Sidewall Samples.
e. Table 8b, Summary of SVOC Confirmation Sidewall Samples.

CSC shall revise the Certification to include the depth of each sample in each table listed and any other part of the Certification where the depth of samples or of the excavation may be needed.

16 **Certification Table 6a, Summary of VOC Verification of Remediation Samples and Certification Table 6b, Summary of SVOC Verification of Remediation Samples.** According to these tables, the depth of the samples has a range of 100-5600 feet. This does not coincide with other site data. CSC shall revise the Certification to display the correct depths of the samples.

17 **Certification Table 9, Statistical Analysis of Confirmation Samples.** There is a discrepancy between the lab reports in Appendix B-4, Floor and Sidewall Confirmation Samples, and Table 9. CSC records 1,3,5-trimethylbenzene as ND in sample FL-35 of Table 9. However, the lab reports in Appendix B show that 1,3,5-trimethylbenzene was found at 3.2 µg/kg in sample FL-35. CSC shall revise the Certification to include the correct value in Table 9 and shall change all other values in all other areas of the Certification to reflect the correct values.

18 **Certification Table 9, Statistical Analysis of Confirmation Samples.** The coefficient of variation is not accepted by Ohio EPA. CSC shall explain the reasoning for using this test on confirmation samples. The Closure Plan Review Guidance (CPRG) describes how to determine the normality of a data set in Part I, Section 3.12, Guidance for Statistical Evaluation of Hazardous Waste Constituent Levels in Soils, page 48. Ohio EPA is not aware of any agreement made with CSC to allow the coefficient of variation to be used on the confirmation samples. If such an agreement was made, CSC shall revise the Certification to include documentation of this arrangement.

19 **Certification Figure 2, Napoleon Facility Plan View.** This figure lacks a label for the power generation plant. The power generation plant is referenced in Certification Section 1.2, Site Location and Description, page 1 of the Certification. CSC shall revise the Certification to include the label of the power generation plant as discussed on page 1.

20 **Certification Figure 6, Final Confirmation Samples and Final Extent of Excavation.** Ohio EPA believes that SW-46(5) was left out of this figure because SW-46(4) and SW-46(6') are clearly labeled on Figure 6. CSC shall revise the Certification to include all information on sample SW-46(5). If CSC did not take a sample at SW-46(5), then CSC shall revise the Certification to include an explanation of the method for labeling samples and why SW-46(5) was omitted.

21 **Certification Appendix A, Correspondence.** Appendix A is not complete. The following is a list of items that could not be found in Appendix A.

a. Ohio EPA required CSC to "complete and submit a health and safety plan to Ohio EPA, NWDO within 30 days of receipt of a notice of approval by Ohio EPA of the closure plan," in the Revised Closure Plan Approval Letter (RCPAL) dated August 1, 2002.
b. Certification Table 5, Inventory of Soil Removed or Closed in Place, shows that 100 tons of treated soil was taken to the Williams County Landfill. ML Chartier Weight Tickets are listed as the method for determining the quantity of the soil taken to Williams County Landfill. Comment 11 of the RCPAL states "copies of manifests and receipts will be sent to Ohio EPA, NWDO for any waste disposed off-site." These weight tickets were not found in either Appendix D, Williams County Waste Manifests; Appendix E, Henry County Load Tickets & Bill Of Lading; or Appendix A, Correspondence.
c. A letter addressed to James Moseley, Ohio EPA, dated October 23, 2002, from Michael Kovacich (for Craig Savage), requested that Ohio EPA consider the delineation of the horizontal extent of volatile organic compounds complete. Appendix A does not include any documentation from Ohio EPA that confirms or denies the completion of the VOC delineation.

The CPRG, Part I, Section 3.18, Certification, page 87, requires that "all correspondence regarding closure activity after Ohio EPA approval" be included in the certification report. CSC shall include all correspondence mentioned above and all other missing correspondence in the revised Certification.

22 **Certification Appendix B, Laboratory Reports and Chain of Custody.** Appendix B is incomplete. The following is a list of items that could not be found in Appendix B.

a. Certification Table 2, Summary of Test Pit Samples, lists vinyl acetate as ND for Test Pit #1, Test Pit #2, Test Pit #3, and Test Pit #4. However, the lab reports for these samples, located in Appendix B-1, Test Pit Samples, do not list vinyl acetate as a parameter.
b. Certification Table 3a, Summary of VOC Composite Clean Soil Stockpile Samples, lists 1,2,4-trimethylbenzene as ND for all clean soil stockpile samples. However, the lab reports for these samples, located in Appendix B-2, Clean and Intermediate Soil Stockpile Samples, do not list 1,2,4-trimethylbenzene as a parameter.
c. Certification Appendix B-2, Clean and Intermediate Soil Stockpile Samples, does not list 4-chlorotoluene as a parameter on samples taken December 6, 2002.
d. Certification Table 7a, Summary of VOC Confirmation Floor Samples, lists sample FL-2 vinyl acetate as ND. But, vinyl acetate is not listed as a parameter in the lab reports found in Appendix B-4, Floor and Sidewall Confirmation Samples.
e. Appendix B-4, Floor and Sidewall Confirmation Samples, does not contain all lab reports for samples SW-46(4) or SW-46-6'.
f. Certification Table 6a, Summary of VOC Verification of Remediation Samples, has vinyl acetate listed as ND, but vinyl acetate is not listed as a parameter on the lab reports in samples such as VR-03-04.

CSC shall revise the Certification to include complete lab reports, for all samples taken, that include all parameters during the investigation and remediation.

23 **Certification Appendix B, Laboratory Reports and Chain of Custody.** The Certification does not include complete laboratory packages from either lab that analyzed samples during the closure. Complete lab packages include, at a minimum, the following information for VOCs and Semi-Volatile Organic Constituents (SVOC): cover page signed by laboratory manager; chain of custody forms; case narrative; presence of field and sample identifications; holding times; preservation and cooler receipt; surrogate recoveries; laboratory blank data; spike data; laboratory control samples; initial calibration; continuing calibration; internal standards; and target compounds. CSC shall revise the Certification to include complete laboratory packages from each lab on separate compact disks.

Ohio EPA requires that the information needed to complete these documents be submitted with the Certification to ensure that the closure performance standards are met. To this end, Ohio EPA strongly suggests that the enclosed document, Data Validation Plan Review Form (Section 1.0, Report Completeness and Technical Holding Times, Section 2.0, VOC Data Validation, and Section 3.0, SVOC Data Validation) should be completed by CSC and submitted as an appendix to the Certification.

24 **Certification Appendix B-3, Verification of Remediation Samples.** The lab reports in the Verification of Remediation section have some "doubles" of samples such as VR-02-01 and VR-02-01(2). These samples are not included in the Certification tables. CSC shall revise the Certification to include an explanation for these samples and other samples listed in this fashion that do not follow CSC's labeling method.

25 **Certification Appendix B-3, Verification of Remediation Samples.** The lab reports in the Verification of Remediation section list VR-03-09 as "unscreened." The Certification does not explain the reason for this. CSC shall revise the Certification to include an explanation as to why this sample was not screened.

The following comments concern the Revised Closure Plan Approval Letter (RCPAL) from Ohio Environmental Protection Agency (Ohio EPA) to Dr. Osman Aly of Campbell Soup Company (CSC), dated August 1, 2002.

26 **Revised Closure Plan Approval Letter, Comment 9.** According to the chains of custody included in RCRA Site Closure Certification Report, Former Holding Pit Unit (Certification) Appendix B-6, Chain of Custody Forms, CSC has collected five (5) field blanks during the closure of the former holding pit unit. This does not meet the requirement found in Comment 9 of the RCPAL. Comment 9 states "For sampling and analysis involving waste delineation and confirmation, Campbell shall collect field blanks at a frequency of 10% of the total number of samples sent to the laboratory at a minimum of one field blank per day." Samples were taken on more than twenty (20) different days. Therefore, more than twenty (20) field blanks should have been collected. CSC shall include, in the revised Certification, all information relating to the missing field blanks. If CSC cannot provide this information, then CSC will provide an explanation as to why the RCPAL was not followed and any correspondence with Ohio EPA that agrees with this deviation from the RCPAL. For further explanation of how to correct this deficiency, please refer to Comment # 23.

27 **Revised Closure Plan Approval Letter, Comment 12.** The Certification contains several topographic maps of the former holding pit unit and surrounding areas. However, these maps do not include descriptions and locations of topographic features. This does not meet the requirement found in Comment 12 of the RCPAL. Comment 12 states "...Campbell shall include a topographic map depicting the ground surface elevations of the mound and natural grade with a scale no greater than 1 inch equals 30 feet and a contour interval no greater than 5 feet. It shall also include detailed descriptions and locations of the topographic features in the vicinity of the mound and at Campbell's plant which may affect conditions at the mound (i.e., buildings, rivers, ditches, etc...)." CSC shall revise the Certification to include a topographic map that meets the standards in Comment 12 of the RCPAL and does not include the excavation area, sampling points, etc.

28 **Revised Closure Plan Approval Letter, Comment 13.** The Certification does not include a separate appendix for the data generated during the ground water investigation. Comment 13 of the RCPAL states "...Campbell shall include a separate appendix in the closure certification report which contains all the data generated during the ground water investigation." CSC shall revise the Certification to include the aforementioned appendix.

The following comments concern Section 5.2.3, Residual Risk Calculation; Table 11, Estimates of Residual Risk; and general risk assessment in the RCRA Site Closure Certification Report, Former Holding Pit Unit (Certification).

29 **Certification, General Risk Assessment.** Throughout the Approved Closure Plan (Plan), Campbell Soup Company (CSC) consistently states that they will be closing the site using the Multiple Chemical Adjusted Risk-Based Generic Clean-up Numbers (MCAGCNs). This can be found in the following references:

a. Plan, Section 13.0, Risk-Based Remediation Standards, page 30, states "Risk-based residential direct contact cleanup numbers adjusted for multiple chemicals, as provided by OEPA risk assessors on May 20, 2002, will be used as the basis of this site closure."
b. Plan, Section 14.6.1, Determination of the Number of Samples, page 35, states "Samples will be collected...to confirm that the maximum remaining soil concentrations for each remaining chemical of concern is below the OEPA calculated multiple chemical adjusted direct contact standards."

c. Plan, Section 16.0, Specifics for Waste-In-Place Closures, page 41, states, "Soils impacted by releases from the former holding pit will remain in place only at concentrations below the site-specific risk based cleanup numbers..."

However, the Certification does not demonstrate the use of MCAGCNs. The Certification demonstrates the use of Risk-Based Generic Clean-up Numbers (GCNs) that were not adjusted for multiple chemicals. Although the way that CSC has used the GCNs is defensible, it is not consistent with the Plan. CSC shall revise the Certification to include an explanation for the deviation from the Plan.

30 **Certification, General Risk Assessment.** The Certification does not include:

a. An explanation of tests used to determine whether the analytical data is normally distributed.
b. Whether the data was found to be normally distributed.
c. If the data was not normally distributed, which type of transformation was applied to it.

CSC shall follow the Closure Plan Review Guidance (CPRG), Part I, Section 3.12, Guidance for Statistical Evaluation of Hazardous Waste Constituent Levels in Soils, page 48, and CPRG, Part II, Section 3.2.4.1, Exposure Point Concentration for Soil, page 18, to determine the normality and concentration term used in the risk assessment. CSC shall revise the Certification to include this information for all chemicals of concern.

31 **Certification Section 5.2.3, Residual Risk Calculation, Page 23.** The first sentence in the section is unclear. Ohio Environmental Protection Agency (Ohio EPA) understands the first sentence to mean that residual risk was calculated at the site by determining the maximum concentration for each chemical of concern (COC). This maximum concentration was determined from the post-closure samples and was then divided by the corresponding GCN for that COC. If this is not what CSC meant, CSC shall revise the Certification to clarify this section.

32 **Certification Section 5.2.3, Residual Risk Calculation, Page 23.** CSC has used the maximum concentration of each COC in the post-closure samples to determine the residual risk. This method does not determine the total risk related to the entire unit, but the risk related to the soil in the post-closure samples. Ohio EPA does not accept this method used by CSC to determine the maximum concentration of each COC, and in turn, risk related to the entire unit. CSC will determine the maximum concentration of each COC from this unit by following the method described below.

CSC shall consider all soil samples taken, from the very first investigative sampling, completed in December 1999, through the last closure samples taken, in determining the maximum concentration of each COC. The only samples that should not be considered when determining the maximum concentration are samples that can be proven to be completely remediated to non-detectable levels for all COCs or proven to be excavated and disposed off-site. For example: All samples that fall within the former holding pit unit that were not treated or excavated must be included in the calculation for maximum concentration for each COC. This includes but is not limited to such samples as PB-02-52 , PB-02-53, PB-02-54, MW-1, MW-2, MW-3, PB-01-36, PB-01-40, PB-01-31, etc.

CSC shall list all samples that are not being taken into consideration for this calculation of the maximum concentration for COCs. CSC must provide adequate documentation to Ohio EPA that the samples that were left out were in fact treated to non-detect levels or shipped off-site.

33 **Certification Table 11, Estimates of Residual Risk.** The GCNs used in this table are not all correct. Please use the approved GCNs that are listed as Attachment A in the Revised Closure Plan Approval Letter (RCPAL). If a value is not given on Attachment A, please refer to Column 2, Single Chemical Non-cancer Direct Contact, and Column 3, Single Chemical Cancer Direct Contact, on the enclosed table titled "Table 1-Residual Generic Cleanup Numbers (GCNs) for Ohio Hazardous Waste Closures." If a value is needed for a chemical of concern and is not on either list, please contact Ohio EPA for that GCN value.

34 **Certification Table 11, Estimates of Residual Risk.** Ohio EPA cannot replicate the 95% Upper Confidence Limit (UCL) calculation used by CSC. To facilitate Ohio EPA's review of the Certification, CSC shall include a table that lists all sample concentrations used to calculate the 95% UCL for each COC and a sample calculation for one of the COCs.

35 **Certification Table 11, Estimates of Residual Risk.** Table 11 does not include carbazole in the cancer risk calculation. Ohio EPA recognizes that carbazole exhibits a cancer risk. CSC shall revise the Certification to include carbazole in the cancer risk calculation.

36 **Certification Table 11, Estimates of Residual Risk.** To facilitate in Ohio EPA's review of the Certification, CSC shall include in the Certification a summary table that lists all samples and the concentrations of the COCs that were not excavated or treated and were used in the risk calculation.

37 **Supplemental Letter to the Certification, Received by Ohio EPA on August 6, 2003; Certification Figure 3, Soil Boring Locations and Initial Extent of Excavation; and Certification Figure 6, Final Confirmation Samples and Final Extent of Excavation.** Figure 3 and Figure 6 show that some of the samples that had contamination from one or more of the 26 COCs, were left out of the residual risk calculation and not excavated. These sample point locations include but are not limited to PB-01-30, PB-01-36, PB-01-39, PB-01-44, PB-01-46, and PB-01-50. CSC shall revise the Certification to show the following modifications:

a. Acenaphthene shall be left out of the residual risk calculation if, and only if, CSC can revise the Certification to provide Ohio EPA assurance that the depth of the excavation, at the sampling points where this chemical was found, is at or below the depth of the sample.

b. Because of the low frequency of detection for 1,1-dichloropropene, 1,2-dibromo-3-chloropropane, hexachlorobutadiene, and, bromobenzene, these COCs may be left out of the residual risk calculation even though not all sampling points that contained these COCs have been excavated and treated to non-detectable (ND) levels, or disposed off site.

c. The 21 other COCs in the supplemental letter that were left out of the residual risk calculation, must be included in the risk calculation in the revised Certification. It appears that CSC is trying to screen these remaining 21 chemicals out of the risk calculation. According to the CPRG, Part II, Appendix D, Section 3.4, Potential Problems, page 9, CSC cannot use the GCNs "as screening values to eliminate chemicals from further consideration in a... risk assessment." Therefore, these COCs shall be included in the residual risk calculation and the maximum concentrations will be calculated from all samples that cannot be proven to be excavated and treated to ND levels or removed off-site.

Table 1 - Residential Generic Cleanup Numbers (GCNs) for Ohio Hazardous Waste Closures

CONTAMINANT	1 Calculated Soil Saturation Limit (SAT) (mg/kg)	2 Single Chemical Noncancer Direct Contact (mg/kg)	3 Single Chemical Cancer Direct Contact (mg/kg)	4 Single Chemical Cleanup No. GCN Direct Contact Soil (mg/kg)		5 Single Chemical Noncancer Protective Of Ground Water (1DAF)(mg/kg)	6 Single Chemical Cancer Protective Of Ground Water (1DAF)(mg/kg)	7 Single Chemical Cleanup No. GCN Protective Of Ground Water (1 DAF)(mg/kg)		8 Single Chemical Noncancer Protective Of Ground Water (20 DAF)(mg/kg)	9 Single Chemical Cancer Protective Of Ground Water (20 DAF)(mg/kg)	10 Single Chemical Cleanup No. GCN Protective Of Ground Water (20 DAF)(mg/kg)		11 Solubility (mg/L)	12 Maximum Contaminant Level MCL (mg/l)	13 Single Chemical Noncancer Ground Water Concentration (mg/l)	14 Single Chemical Cancer Ground Water Concentration (mg/l)	15 Single Chemical Cleanup No. Ground Water Concentration (mg/l)

** Cadmium- As suggested by IRIS, RfDo=1.0E-03 and OAF=0.03 for soil (food) were used in calculations.

"-" This value is not applicable or is not appropriate for this column.

Footnotes:

1 - Calculated soil saturation limit (using method from Soil Screening Guidance: Technical Background Document, U.S. EPA, 1996, equation #9).

2 - Risk-based standard for noncarcinogens for soil, based on a child resident (considers ingestion of soil, inhalation of volatiles and particulates from soil, and dermal contact with soil.)

3 - Risk-based standard for carcinogens for soil, based on an age-adjusted resident (adult + child) (considers ingestion of soil, inhalation of volatiles and particulates from soil, and dermal contact with soil.)

4 - Single chemical cleanup number for ingestion of soil, inhalation of volatiles and particulates for soil, and dermal contact with soil (calculated soil saturation limit is the default value when less than the carcinogen and noncarcinogen standards.)

5 - Risk-based standard for noncarcinogens for soil protective of ground water, based on a child resident (considers ingestion of soil and ground water, inhalation of volatiles and particulates from soil and ground water, and dermal contact with soil and ground water, with a dilution-attenuation factor of one (1 DAF). (See discussion on DAFs in section 2.5.5 of Soil Screening Guidance: Technical Background Document, U.S. EPA, 1996).

6 - Risk-based standard for carcinogens for soil protective of ground water, based on an age-adjusted resident (adult + child) (considers ingestion of soil and ground water, inhalation of volatiles and particulates from soil and ground water, and dermal contact with soil and ground water, with a dilution-attenuation factor of one (1 DAF). (See discussion on DAFs in section 2.5.5 of Soil Screening Guidance: Technical Background Document, U.S. EPA, 1996).

* - Single chemical cleanup number for ingestion of soil and ground water, inhalation of volatiles and particulates from soil and ground water, and dermal contact with soil and ground water (the direct contact with soil standard from column 4 is the default value when less than the 1 DAF carcinogenic and non-carcinogenic standards.)

- Risk-based standard for noncarcinogens for soil protective of ground water, based on a child resident (considers ingestion of soil and ground water, inhalation of volatiles and particulates from soil and ground water, and dermal contact with soil and ground water, with a dilution-attenuation factor of twenty (20 DAF). (See discussion on DAFs in section 2.5.5 of Soil Screening Guidance: Technical Background Document, U.S. EPA, 1996).

9 - Risk-based standard for carcinogens for soil protective of ground water, based on an age-adjusted resident (adult + child) (considers ingestion of soil and ground water, inhalation of volatiles and particulates from soil and ground water, and dermal contact with soil and ground water, with a dilution-attenuation factor of twenty (20 DAF). (See discussion on DAFs in section 2.5.5 of Soil Screening Guidance: Technical Background Document, U.S. EPA, 1996).

10 - Single chemical cleanup number for ingestion of soil and ground water, inhalation of volatiles and particulates from soil and ground water, and dermal contact with soil and ground water (the direct contact with soil standard from column 4 is the default value when less than the 20 DAF carcinogenic and non-carcinogenic standards.)

11- Sources include: Soil Screening Guidance: Technical Background Document, Table 36 (U.S. EPA, 1996), Hazardous Substances Data Base, Syracuse Research Corporation's Environmental Science Data Base, Physical Properties of Organic Chemicals (Howard and Meylan), CRC Handbook of Chemistry and Physics, and U.S. EPA Region IX table of physical properties.

12 - Maximum contaminant levels (MCLs) based on federal primary drinking water standards (OAC 3745-81-11 and 3745-81-12).

13 - Risk-based standard for noncarcinogens for ground water, based on a child resident (considers ingestion of ground water, inhalation of volatiles from ground water while showering, and dermal contact with ground water while showering.)

14 - Risk-based standard for carcinogens for ground water, based on an age-adjusted resident (adult + child) (considers ingestion of ground water, inhalation of volatiles from ground water while showering, and dermal contact with ground water while showering.)

15 - Single chemical cleanup number for ingestion of ground water, inhalation of volatiles from ground water while showering, and dermal contact with ground water while showering. Maximum Contaminant Level is the default standard when less than the risk-based standard.

Osman M. Aly
Campbell Soup Company
1 Campbell Soup Company
Camden, New Jersey 08103

Dear Mr. Aly:

On August 22, 2003, Ohio EPA conducted a review of the financial assurance and liability coverage documentation on file for the Campbell Soup Company. I evaluated the facility for compliance with closure/post-closure cost estimate, closure/post-closure care and liability coverage requirements as set forth in Ohio Administrative Code (OAC) rules 3745-66-42 through 3745-66-47 and the August 2001 Amended Director's Final Findings and Orders (Orders).

Orders were issued on October 18, 2000, and amended on August 22,2001, for the Campbell Soup Company. The Order, Section V.1.b, requires that Campbell Soup establish financial assurance for closure and liability coverage.

Documentation submitted July 23 and August 2, 2002, to demonstrate financial assurance for closure/post-closure care and liability requirements included a July 18, 2002 Letter of Credit (LOC) No. P-226892, and July 15, 2002 standby trust agreement for closure care issued by JP Morgan Chase Bank and a July 15, 2002 LOC No. P-226893, and a July 18, 2002 standby trust agreement for liability coverage respectively.

General concerns noted in a letter to you on October 4, 2002, indicated the wording of the LOC and Standby Trust Agreement were deficient and needed to be corrected. Documentation received November 1, 2002, from you via a telefax met the accompanying letter requirement as required by OAC rule 3745-66-43(C)(4) .

Upon review of the above documentation, **Campbell Soup is in violation of OAC rules:**

- **3745-66-42, because the cost estimate has not been updated for inflation.**
- **3745-66-43, because the financial assurance LOC mechanism has not increased to reflect an inflationary increase, and the loc and standby trust agreement has not been corrected to reflect the correct wording.**
- **3745-66-47, because the LOC and Standby Trust Agreement for third party**

- **3745-66-47, because the LOC and Standby Trust Agreement for third party liability coverage has not been corrected to reflect the correct wording.**

To demonstrate compliance with the above violations, Campbell Soup must annually submit updated cost estimates pursuant to OAC rule 3745-66-42 (B), and update the LOC to reflect a current cost estimate pursuant to OAC rule 3745-66-43(D)2 which states the LOC shall be issued for at least the current closure cost estimate. In addition, the LOC and standby trust agreement wording must be identical to wording specified in paragraph (A) and (D) of 3745-55-51 pursuant to OAC rule 3745-66-43(A)2 and 3745-66-43 (D)2. These deficiencies must be corrected immediately. Submit this documentation to me immediately.

If you have any questions you may contact me at (614)644-2951.

Sincerely,

Tina Jennings

RE: Campbell Soup Company, Napoleon Site
Addendum to RCRA Site Closure Certification Report

Dear Ms. Reynolds:

Enclosed please find signed Certification Statement from Campbell Soup Company, as required by Ohio Administrative Code (OAC) 3745-50-42(D). The Certification is an Addendum to the RCRA Site Closure Certification Report that was submitted to your office on July 3, 2003.

Please give me a call at (856) 853-1876 if any additional information is needed.

Sincerely,

CAMPBELL SOUP COMPANY

Subject: Re: CSC

hmm. these aren't super common lab contaminants, & some of them could be related to activities at the pit. did anything show up from the water samples they took from the mound(the ones where they were trying to see if GW was a concern)? I don't recognize all the names, but would suggest we have them include the 4 chems that were found 3 or 4 times & the one above the GCN.

>>> Kara Reynolds 08/20/03 12:17PM >>>
I took this straight from the tables that they recently sent me. I threw in the 3's and 4's because with the number of samples that they took, 4 would be on the border line (4.5% frequency, a good number is ususally 5%) for being screened out. So, let me know what you think I should do. Most of these hits were low hits. But then again, some of them were pretty high. The one with the asterisk was above the unadjusted GCN so it technically can't be screened out. They are all found in samples that were not excavated and should be included in the RA.

Dr. Aly,

I received the certification statement from Campbell Soup Company. However, I still have a few questions. I am unable to read the signature on the statement and I was wondering if you could give me the name of the person that actually signed the document. Also, I need to know if Global Engineering Systems is a part of Campbell Soup Company or not.

Please e-mail your response at your earliest convenience.

From: Michael Terpinski
To: Kara Reynolds
Date: 8/14/03 3:17PM
Subject: Re: One more for the road.

I'd use 5/15 as the last day of field activity. I seem to remember knowing they might go a bit over & saying "just get it off-site as soon as ppossible b/c we won't have time to process an extension approval by the time the stuff is gone." so, I wouldn't cite it as a comment or violation.

>>> Kara Reynolds 08/14/03 02:50PM >>>
So they had a modification for an extension for closure to May 1. they had all the backfill and regrading done in April. They didn't get all the soil and debris shipped off-site until May 15. They are calling May 15 their last day of field activities. I know that Getz and I talked to Jeremy Carroll about this while you were gone. I don't think it was about the actual time they went over closure, but the date that should be used for the certification report (60 days after). So do I call them on it or not? And if I do, is it a comment or a violation b/c they are in enforcement already?

Subject: Closure Certification

Dr. Aly,

Good Afternoon. I wanted to make sure that you received my last email that included the Ohio Administrative Code 3745-50-42(D) paragraph that I needed you to sign and send to me in addendum to the Campbell Soup Company Closure Certification for the Former Holding Pit.

If you did not receive this, please let me know. This paragraph and your signature are needed before a decision can be made on this document.

If you have any questions please contact me at your earliest convenience.

Re: Additional Information for Certification Report
Former Holding Pit, Campbell Soup, Napoleon, Ohio

Dear Ms. Reynolds:

GeoTrans, Inc. (GeoTrans) has prepared this document to provide the Ohio Environmental Protection Agency (Ohio EPA) with additional information to aid in your review of the *RCRA Site Closure Certification Report* (Certification Report) dated June 27, 2003, submitted by Campbell Soup Company (Campbell) on July 3, 2003. This letter addresses the requests outlined in your e-mail correspondence, dated July 24, 2003.

Section 5.2 of the Certification Report states "Due to successful treatment and remediation of the impacted soils at the site, 26 of the original chemicals of concern were eliminated during the remediation of the site". The 26 parameters that were detected in the investigation but were not detected during remediation activities are shown in the attached tables. Table 1 identifies the boring locations and sample depths where these 26 parameters were detected in the May 2001 investigation. The maximum and minimum concentrations of the 26 parameters and the number of detections during the investigation are shown in Table 2. We have made the following observations regarding these 26 parameters detected during the investigation:

- 25 out of 26 of the parameters are volatile organic compounds (VOCs), which were successfully treated by the thermal desorption unit.

- Acenaphthene was the only semi-volatile organic compound (SVOC) eliminated following remediation. Acenaphthene was detected in 3 locations in the investigation (PB-01-32, PB-01-34, and PB-01-41). The location and depths of these samples are clearly within the limits of the excavation, and were removed during remediation activities. PB-01-32 and PB-01-34 were disposed of off-site at the Williams County Landfill during remediation activities. PB-01-41 was excavated during remediation activities and treated by the thermal desorption unit.

- None of the maximum concentration of the 26 parameters exceeded the Single Chemical Generic Cleanup Numbers (GCNs) (Table 1 of Appendix D, Closure Plan Review Guidance for RCRA Facilities, Part II, Ohio EPA, March 1999).

Table 3 illustrates that these 26 parameters were not detected in the clean and intermediate soil stockpiles samples collected during remediation activities.

Tables 4 and 5 outline the detections of these 26 parameters in the verification of remediation samples (the treated soil stockpiles) and the confirmation of remediation samples (excavation floor and sidewall).

The laboratory used during the investigation included additional analytes, which are not typically analyzed by EPA 8260B, as listed below:

- 1,1-dichloropropene
- bromobenzene
- 2-chlorotoluene
- 4-chlorotoluene
- tert-butylbenzene
- sec-butylbenzene
- 1,2-dibromo-3-chloropropane
- hexachlorobutadiene

During the remediation activities another laboratory was used to improve turn around times. Therefore, these eight parameters were not analyzed in 11 of 53 samples used to the close the site (8 verification of remediation samples, 2 sidewall samples, and 1 floor sample). Although these parameters were not analyzed in all closure samples, the closure strategy was not revised for the following reasons:

- Non-detect results for the above listed 8 VOCs were reported for 42 of 53 samples used to close the site.

- The thermal desorption unit reached in excess of 550 deg. F throughout the project. Laboratory analysis confirmed that VOCs were destroyed during treatment. Therefore, these additional 8 VOCs, if present, would have been destroyed during treatment.

- When these eight parameters were detected in the investigation phase, they were detected 70 times with J-values, leaving only 7 detections above the laboratory reporting limit. All detections above the laboratory reporting limit were for two parameters, sec-butylbenzene and tert-butylbenzene. All detections were below the GCNs.

- The borings in which sec-butylbenzene and tert-butylbenzene were detected, above the laboratory reporting limit (PB-01, PB-01-32, PB-01-34, and PB-01-45), were within the limits of the excavation. This soil was removed during remediation activities and disposed of off-site at the Williams County Landfill.

- The 2 sidewall samples and the floor sample for which the 8 parameters were not analyzed were non-detect for all other VOCs.

In summary, the 26 parameters shown on the attached tables were excluded from the residual risk calculations used to close the site because they were successfully remediated by the thermal desorption unit or by off-site disposal.

Please call us at (734) 213-4068 with any questions or concerns.

Sincerely,

Tesha Humphriss

Subject: Re: Statistics

Kara,

No, you're right. There are times that a normality test is not needed. Your case, Campbells, looks like one to me. However, there are also times when you need to have an ideal of the data distribution. For example, when comparing an on-site data distribution to a background distribution using a T-test. I guess the real evaluation is whether 1) you need to apply statistics and 2) is a normal distribution an underlying assumption in that statistical test.

Let me know if you'd like to talk about this issue further. It is important. In addition, let me know if you have anymore questions on statsitics; I maybe can't answer them, but if I can't, Dan Lukovic probably can.

Regards,
Erik

>>> Kara Reynolds 08/01/03 09:25AM >>>
Thanks Erik,

That really cleared up some questions that I had about the CV. I still am a little confused though. When it comes to sampling, should a company always use a normality test, no matter what they are planning to do with the data or why they are sampling, just to find the distribution? I guess I was under the impression that a normality test was only needed when another statistic was used, such as the 95%UCL.

My thinking, and it is very possible that I am wrong, is that there is no need for a normality test for this data because it is only part of what is being used in the calculation of the 95%UCL (and in turn the risk assessment). The data set being used for the 95%UCL (which includes this data) should have a normality test. I guess I figure that doing a normality test for only part of the data set used in the 95%UCL isn't a good representation and in my mind I wouldn't bother to do it unless I used the entire data set. Am I making sense?

Could you clear this up? Should I always make the company do a normality test?

Thanks for your help,
Kara

To: Kara Reynolds
Date: 8/1/03 8:54AM
Subject: Re: Statistics

Kara,

The short answer to your question is: The coefficent of variation is not an adequate measurement for normality.

The reason is that there is no strict definition of what CV represents a normal population or when it does not. In addition, CVs are usually not expressed with confidence intervals, it is hard to judge whether sampling is sufficient to support a determination of normality from a CV without a measure of its variation. Finally, I've never seen a discussion on how to factor in non-dected data and what bias non-detected data may impart to a CV and its use for a normality determination.

For these reasons, DHWM uses standard and accepted measures of normality such as the Shapiro-Wilks test. To calculate a 95% UCL, the consultant would have to verify the underlying data distribution (ie. lognormal 95% UCL or normal 95% UCL). We really do need to have a standard measure to determine that the calculation method of the 95% UCL is using the correct data distribution.

The CV is useful. It does give you a feel about the heterogeneity or dispersion of a dataset. In addition, U.S. EPA's Soil Screening Guidance (attached, see pages 12 through 20.) uses it to calculate the appropriate number of composite samples for determination of soil screening levels (SSL). However, this approach is not valid for RCRA closure (ie. we're past the screening level stage and we don't determine risk levels as the CERCLA program). I mention this because Campbells may be trying to use a variant of this approach.

Let me know if you need any additional information. I'll be here until 3:30 today.

Regards,
Erik

>>> Kara Reynolds 08/01/03 07:57AM >>>
Hello Erik,

I don't believe we have met, but I have heard a lot of good things about you. So I hope you can help me. I am one of the new risk assessors up in NWDO. I have been here almost 6 months and am looking forward to being off probation.

Right now I am looking at a sight that James Mosely had before he left. It was supposed to be a "simple certification" and has turned out to be anything but that.

I noticed that Mylynda CCd you on my email so the following paragraph is pretty much a repeat with a few minor changes. Mylynda has been working with me on some things for this sight so she has an idea of what's going on. If I'm not making things clear, please let me know.

I am looking at the Campbell Soup Company (CSC) Certification. They have taken 19 samples (after they excavated) from the floor and sidewalls of this holding pit. They then ran Coefficient of Variation tests on each COC found in these 19 samples. They say this test is to "ensure a representative set of samples is obtained." 1. Is this needed if the samples are only being used to show the concentrations left in the soil after excavation ? These samples are used in the risk assessment but along with approximately 50 other

samples. So I am under the impression that they did this to try and show the samples were normal even though it may not be needed.

2. I was told that we don't accept the Coefficient of Variation to show normality anymore. That Shapiro-Wilks and others of the like should be used. Is this true?

Please let me know if you need any other information.

Thanks,

Kara

Subject: Re: Statistics

Kara,

Erik would be the best person to answer the questions in your first paragraph. I don't know enough about confirmation sampling or statistics to address those questions with certainty.

The last paragraph in your email is correct. Their approach is fine, and they should do a normality test on data sets where they are calculating a 95% UCL.

Mylynda

>>> Kara Reynolds 07/31/03 04:36PM >>>
Mylynda,

Hope you day is going well. I have a few questions about the statistics needed during a Closure/RA.

I am looking at the Campbell Soup Company (CSC) Certification. They have taken 19 samples (after they excavated) from the floor and sidewalls of this holding pit. They then ran Coefficient of Variation tests on each COC found in these 19 samples. They say this test is to "ensure a representative set of samples is obtained." 1. Is this needed if the samples are used to show the concentrations left in the soil after excavation ? In the end they are using GCN's with a different set of data. So I am under the impression that they did this to try and show the samples were normal even though it is not needed. But in the end, they use a data set for the risk that, although includes these samples, uses a larger data set. 2. I was told that we don't accept the Coefficient of Variation to show normality anymore. That Shapiro-Wilks and others of the like should be used. Is this true?

For the RA, they are taking the maximum concentration or the 95% UCL and dividing it by the GCN and adding them together to show they passed (or didn't pass) risk. They are using the 95%UCL's for 8 of the COCs and the max concentration for the rest. They did not use a normality test for any of the COCs in the set of samples used in the RA. 3. They need to show normality for the COCs that they use a 95% UCL for, Right? 4. But if they are using the max concentration, they don't need to show normality, Right?

I guess that is it. Let me know what you think.
Thanks in advance for all the help!

Kara

INTER-OFFICE COMMUNICATION

TO: Kara Reynolds, Remediation Group, DHWM-NWDO

FROM: John Weaver through Geoff Leking, Geologist 4, DDAGW-NWDO

DATE: August 1, 2003

SUBJECT: Campbell Soup Company, Henry County, OHD 005 419 171.

RCRA Site Closure Certification Report - Former Holding Pit, document dated June 27, 2003; GeoTrans, Inc. Received by Ohio EPA (NWDO) on July 7, 2003.

Introduction:

The Division of Hazardous Waste Management (DHWM) has requested that the Division of Drinking and Ground Waters (DDAGW) perform a review of the above referenced document.

The Campbell Soup Company (Campbells) is located in north-central Henry County at 1273 State Route 110, Napoleon, Ohio. Campbells occupies approximately 63 acres at the above address and produces, packages, and distributes food goods.

Campbells produced containers (cans) for food goods in an onsite manufacturing facility until July 1998. The steel cans were coated with a two-phase material to act as a rust inhibitor and to increase the durability of the cans. Excess and waste coating material, existing in a semi-solid state, and also spent solvents were periodically dumped into two onsite holding pits at Campbells from 1981 to 1983. These holding pits were constructed on top of an elevated area from onsite dirt obtained from excavation activities performed throughout the Campbells site. The holding pits were reportedly lined with natural clay and compacted prior to emplacing the wastes. The total dimensions of the holding pits were approximately 20 feet by 35 feet by 2-3 feet deep. Wastes contained in the pits were excavated in 1983, mixed with sand, and disposed of offsite at the Evergreen Landfill. Constituents of concern (COCs) associated with the holding pits are volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs).

Ohio EPA identified the former holding pits as an unpermitted treatment, storage, and disposal unit subject to RCRA closure and was subsequently issued a Notice of Violation letter on May 16, 2000. Director's Final Findings and Orders were issued to Campbells on October 18, 2000 and again on July 25, 2001 and required the facility in part, to close the former holding pits in accordance with OAC Rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20. Campbells subsequently submitted a RCRA

closure plan for the former holding pits on October 31, 2001 and May 28, 2002. The closure plan was ultimately approved with modifications via letter to Campbells dated August 1, 2002. As part of the approved closure plan, Campbells was directed to install three monitoring wells around the periphery of the former holding pits to determine the extent of any impacts to the natural shallow unconsolidated soil and ground water zones. Monitoring well installation took place on August 26 and 27, 2002 and ground water sampling was conducted on September 9, 2002. The certification report dated June 27, 2003 for the former holding pit is the subject of this review.

Compliance Issues:

There are no compliance issues associated with this review.

Conclusions:

1. The Campbell Soup Company has adequately demonstrated that the mound/former holding pit area has not impacted the shallow saturated subsurface in the natural unconsolidated zone for the purpose of demonstrating clean closure of the ground water pathway at the RCRA unit per OAC Rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20.

Comments:

1. The following comment is provided for historical reference.

   The Campbell Soup Company (Campbells) was directed via an Ohio EPA Notice of Deficiency (NOD) dated April 23, 2002 and a closure plan approval letter dated August 1, 2002 to install a ground water monitoring network around the periphery of the mound/former holding pit area [RCRA unit]. The installation of three shallow monitoring wells was deemed warranted to adequately characterize any affects the mound/former holding pit area may have had on shallow ground water within the natural unconsolidated zone in support of closure of the RCRA unit. Campbell's contracted consultant, GeoTrans, Inc. (GeoTrans), installed monitoring wells MW-1, MW-2, and MW-3 with Ohio EPA oversight on August 26-27, 2002 at agreed upon locations and per Ohio EPA specifications as detailed in a May 24, 2002 [Revised] RCRA Site Closure Plan.

   GeoTrans collected water level measurements from wells MW-1, MW-2, and MW-3 on August 28, 2002 following installation and observed that all three wells had limited amounts of ground water. As such, monitoring well development activities consisted of bailing well MW-1 dry while wells MW-2 and MW-3 were

not developed and simply allowed to recharge further. All three monitoring wells were sampled by GeoTrans on September 9, 2002 for analysis of volatile organic compounds (VOCs) per Method 8260B and semi-volatile organic compounds (SVOCs) per Method 8270. Analytical results and a complete discussion of the monitoring well installation effort were submitted to Ohio EPA by GeoTrans in a September 25, 2002 document entitled, 'Shallow Groundwater Report - Former Holding Pit.' The aforementioned document is included in Appendix A of the closure certification report. Per Ohio EPA request, GeoTrans submitted a quality assurance/quality control (QA/QC) report from their contracted laboratory (Brighton Analytical, Inc.) on September 30, 2002. The QA/QC report indicated that the ground water analytical results from wells MW-1, MW-2, and MW-3 were representative of shallow ground water quality beneath and adjacent to the mound/former holding pit area. Ohio EPA reviewed the documents referenced above and deemed them adequate to support closure of the mound/former holding pit area per OAC Rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20.

2. As noted in the April 23, 2003 NOD and the August 1, 2002 closure plan approval letter, if no organic constituents of concern (COCs) are detected in the shallow monitoring well network above corresponding practical quantitation limits (PQLs) [or an alternate limit acceptable to the director] which provide the lowest limit of detection for the corresponding analytical method as specified in USEPA SW-846 Methods, then it can be concluded that no COCs have leached from the mound/former holding pit area and impacted shallow ground water in the natural unconsolidated zone for the purpose of demonstrating clean closure of the unit.

   Based upon a review of the closure certification report, there were no detections of any VOCs or SVOCs above reporting limits at wells MW-1, MW-2, and MW-3 for the September 9, 2002 sampling event. All reporting limits were below corresponding maximum contaminant levels (MCLs). As such, Ohio EPA concludes that no COCs have leached from the mound/former holding pit area and impacted shallow ground water in the natural unconsolidated zone for the purpose of demonstrating clean closure of the ground pathway at the RCRA unit.

For questions, please contact John Weaver, Division of Drinking and Ground Waters, Northwest District Office, Ohio EPA, at (419) 373-3098. Any written correspondence should be sent to Kara Reynolds, Division of Hazardous Waste Management, Northwest District Office, Ohio EPA, 347 North Dunbridge Road, Bowling Green, OH, 43402.

Subject: Closure Certification

Dr. Aly,

As per our phone conversation earlier this morning, the Ohio EPA Closure Plan Review Guidance requires that the owner/operator must sign the certification statement located in Ohio Administrative Code (OAC) 3745-50-42(D). Please send the exact wording found in OAC 3745-50-42(D) with your signature, title, etc. in addendum form to the address listed below.

If you have any other questions, please contact me at your earliest convenience.

OAC 3745-50-42(D)
"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

Thanks,

Kara Reynolds

Attachments: CampbellsMCAGCNs.xls; CampbellGCNsCS.xls; CampbellIndGCNs.xls; CampbellGCNs
.xls; VaporIntrusion10_19_01.wpd

Amber & James,

Here are the spreadsheets I used for Campbell's. CampbellsMCAGCNs are the multiple chemical adjusted residential GCNs that take into account soil sat levels. CampbellGCNsCS is the spreadsheet I sent to Craig Savage (the consultant who called for help). CampbellIndGCNs is the spreadsheet I used to calculate the industrial GCNs. CampbellGCNs is the spreadsheet I used to calculate the residential GCNs (the sheet is displaying only from cell AU on, just pull out the rest of the cells to see the calculations).

This is how the help went. Craig asked me to generate GCNs for the chemicals at the unit for which there aren't GCNs in Table 1 of the CPRG. I did. Then he asked me what the numbers would be once they are multiple chemical adjusted. So I sent him that too. Then he asked me what the difference would be for industrial numbers. So I told him that (I don't think I sent him the spreadsheet). I also cautioned him that industrial numbers would require a deed restriction that NWDO may or may not approve.

Let me know if you need anything else.

Mylynda

>>> Amber Hicks 02/22/02 02:25PM >>>
Hi Mylynda
I have a guestion for you. Did you work on developing risk based concentrations for Campbell's ?
I remember you asking me if I had directed a facility to talk with you about developing numbers, but I wasn't sure if it was Campbell's.
I hadn't directed them at that time, but now James Moseley is reviewing their closure plan.
If you did work on Campbell's could you email me your spreadsheets on your calculations of these numbers when you get a chance ? James would like to understand how these kind of numbers are developed - specifically the Campbell's numbers to better understand/review their plan.
We would both appreciate it.
Also, could you email your vapor intrusion paper that you developed for the CPRG supplement ?
Thanks for all of your help as always.
Amber

This document is a work-in-progress of the Division of Hazardous Waste Management Staff. This document is subject to change and has not received the final approval of Ohio EPA management. It does not represent either the official position or policy of Ohio EPA. This is a draft.

Vapor Intrusion Guidance

What Vapor Intrusion Is

As defined by the leaching and volatilization assessment (LAVA) workgroup of the Ohio EPA waste management cleanup program subcommittee (WMCUPS), the volatilization to indoor air pathway (or vapor intrusion pathway) may be envisioned as a structure sitting above a zone of contamination, either volatile organic compound (VOC) contaminated soil or ground water. Contaminant vapors move into the soil gas above the contaminated zone by diffusion, and then move through air-filled soil spaces at a rate defined by chemical-specific soil gas diffusivity. Due to a combination of the effects of wind, and stack effects due to building heating and ventilation, the enclosed space of the building is assumed to be underpressurized with respect to soil gas pressure. This underpressurization sets up a convective air movement in the soil surrounding the structure; the area influenced by this convection is called the building's zone of influence. Contaminant vapors that enter the zone of influence of the building may be swept up into the building through cracks in the basement or foundation by convection, or they may diffuse through cracks or building materials (Ohio EPA, 2000).

Why Vapor Intrusion Should Be Assessed

According to the U.S. EPA CA725 form, recent evidence from the Colorado Department of Public Health and Environment, and others, suggests that unacceptable indoor air concentrations are more common in structures above ground water with volatile contaminants than previously believed. Reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above, and adjacent to, ground water and soil with volatile contaminants) does not present unacceptable risks.

When to Assess the Vapor Intrusion Pathway

The vapor intrusion pathway should be considered at any unit where volatile organic compounds (VOCs) are constituents of concern (COCs). Unfortunately, because unit-specific parameters are needed to calculate the risk from this exposure pathway, generic cleanup numbers or screening standards are not feasible. However, the Johnson and Ettinger model spreadsheets for assessing vapor intrusion available from U.S. EPA are easy to use and can be run relatively quickly in order to determine unit-specific risks from indoor air. In addition, the models have two tiers to account for the level of unit-specific data available.

The vapor intrusion pathway needs to be considered for any receptor that will be exposed to indoor air at a closure unit where volatile contaminants of concern exist. This includes indoor industrial workers as well as residents.

To determine whether to evaluate the vapor intrusion pathway at a unit, answer the following questions based on the conceptual site model (CSM):

-Are any of the contaminants of concern in ground water or soil volatile organic compounds?
-Are there any present or potential enclosed structures that may be located above a contaminated area, including possible ground water contaminant plumes?
-Is there a potential receptor that may be exposed to air inside the building?
-Do any of the contaminants meet the criteria of a Henry's law constant less than $1x10^{-5}$ atm-m^3/mol and a molecular weight less than 200 g/mol?

If the answer to all of the previous questions was "yes", then the vapor intrusion to indoor air exposure pathway needs to be evaluated for the unit.

Information that is Critical to Calculating the Risk from Vapor Intrusion

The vapor intrusion pathway is critical to evaluate, especially at units where most other exposure pathways have been ruled out. An example of this is a unit with contamination left in place that is capped with concrete and adjacent to or relatively near a building. In this case, a receptor would not come into contact with the contamination via the routes typically evaluated in a risk assessment (ingestion, inhalation, and dermal exposure to soil). This would leave vapor intrusion as a possible exposure route due to the inability of the vapors to escape through the cap, which may cause the vapors to preferentially enter the building. Another example would be any unit where ground water is or may become contaminated above potable use levels and may be subject to a deed restriction (ingestion, inhalation, and dermal exposure to ground water pathways are not evaluated).

The vapor intrusion pathway is also important to evaluate when the soil type is especially permeable, for example with sandy soils. The risk prediction can change by as much as two orders of magnitude depending on the soil type used in the model calculations. With permeable soils, the risk from vapor intrusion may exceed the risk from the typical exposure pathways used to calculate risk to a receptor. Therefore, it is particularly important to evaluate the boring logs, U.S. Geological Survey information, and any other information pertaining to soil type at the unit before entering a soil type in the models as an input.

Because soil type is a highly sensitive parameter in the Johnson and Ettinger models, the most porous soil type that consists of 30% or more of the soil between the building

or the surface and the contamination should be used in the screening models. The advanced models have the potential to evaluate up to three different soil layers in conjunction, so for advanced modeling the three most common soil types under the unit should be used. The soil types should be considered in the following order based on permeability, with those at the top of the list being most porous:

-S; sand,
-LS; loamy sand,
-SL; sandy loam,
-SCL; sandy clay loam,
-L; loam,
-SIL; silty loam,
-CL; clay loam,
-C or SI; clay or silt,
-SC; sandy clay,
-SICL; silty clay loam,
-SIC; silty clay.

How to Assess the Vapor Intrusion Pathway

The method preferred by Ohio EPA DHWM for evaluating vapor intrusion is the Johnson and Ettinger model for subsurface vapor intrusion into buildings. This model was chosen based on the recommendation of the LAVA workgroup of WMCUPS, and is also recommended in state guidance documents by the Michigan Department of Environmental Quality, the Massachusetts Department of Environmental Protection, and the Colorado Department of Public Health and Environment.

The Johnson and Ettinger models can be found on the U.S. EPA website. These models can be downloaded at:

http://www.epa.gov/superfund/programs/risk/airmodel/johnson_ettinger.htm

The models are available in Excel and Lotus formats. The models are also available through the Central Office Risk Assessment Section. The user's guide for the models can be downloaded as an Adobe Acrobat file from the above website. The assessor should read the guide before using the models for the first time.

Ohio EPA DHWM will consider other vapor intrusion models including but not limited to AIR-3D, VENT-3D, and TOVOC. If using a model other than the Johnson and Ettinger models, the submission should be accompanied by adequate documentation to facilitate a review of the model results.

In performing standard risk calculations at a unit, DHWM assesses the inhalation pathway from both soil and ground water. Soil is evaluated assuming particulate

inhalation and inhalation of volatile contaminants found in the soil. Ground water is evaluated assuming inhalation of volatile contaminants while showering. Because the vapor intrusion pathway has some overlap with these inhalation pathways, it is not appropriate to assess the risk from vapor intrusion additively with these other inhalation pathways. If vapor intrusion is found to be a pathway of concern at a unit, it should be assessed separately from other inhalation pathways. The risk from vapor intrusion should, however, be added to risks from additional pathways (e.g., ingestion, dermal, etc.) to a receptor if other inhalation pathways are not assessed.

Information about the Johnson and Ettinger Models

There are eight separate models available to calculate indoor air exposure to contaminants. The eight versions are: soil screening model, ground water screening model, soil advanced model, ground water advanced model, soil gas screening model, soil gas advanced model, NAPL screening model, and NAPL advanced model. The advanced models require more unit-specific information than the screening models. The assessor should use the screening models when little unit-specific information is available. If enough unit-specific information is available to run the advanced models (see Tables 1 and 2 for which information is needed), the advanced models should be run. Because the advanced models require more unit-specific input, they should give more accurate predictions than the screening models, and therefore are preferred when the appropriate information is available.

The soil and ground water models can be used to calculate either a risk-based acceptable soil or ground water concentration or the risk from a currently existing soil or ground water concentration. These models can be used in developing unit-specific cleanup standards that include the vapor intrusion pathway.

The soil gas models can only calculate forward risk from a currently existing soil gas concentration. The soil gas models are therefore only relevant in determining if a risk to human health currently exists at the unit, not to determine risk-based standards for future use of the unit. The soil gas model can be used in lieu of the soil and/or ground water models where soil gas sampling data is available and relevant to calculate forward risk at a unit in order to reduce the uncertainty associated with that portion of the model.

The NAPL models are not suggested for use by Ohio EPA DHWM at this time. The reason for this is that the current policy of DHWM is to not allow free-phase contaminants to remain in the soil, even at levels below risk-based standards. In addition, the models require assumptions to be made about the fate, transport, and attenuation of the NAPL contaminants. The current policy of DHWM is not to accept models that assume attenuation of contaminants.

The information needed to calculate vapor intrusion risk using the Johnson and Ettinger models can be found in Tables 1 and 2.

The models themselves each consist of five Excel worksheets in a workbook. The first sheet, DATENTER, is the sheet where all the inputs listed in Table 1 are to be entered by the user. The second sheet, CHEMPROPS, is the sheet that will list all the toxicological and physical properties of the chemical for which risk is being calculated. This information is drawn from another worksheet, VLOOKUP. The intermediate calculations performed in calculating risk are shown on the INTERCALCS worksheet.

The VLOOKUP sheet is the list, in order of CAS number, of the chemicals available to model. More chemicals can be added to the VLOOKUP table. Instructions on how to add chemicals are given in the user's guide. It should be noted that the values in the VLOOKUP table are not always consistent with the values used by Ohio EPA DHWM. When evaluating a chemical, always check the values in the VLOOKUP table against the values used for other risk assessment calculations within the division. These values can be accessed by contacting the Central Office Risk Unit or, for employees, on the intranet at:

http://www.epa.state.oh.us/agency/hwm/ErasWeb/eras_web_pages/eras_frame.htm

under the "Risk Resources" button.

Soil Gas and Indoor Air Sampling

The Johnson and Ettinger models are considered to be reasonable estimators of risk from vapor intrusion at a unit based on validation studies (Johnson et. al., 2000, Fitzpatrick and Fitzgerald 1996). However, unit-specific conditions may cause the risk from vapor intrusion to be significantly over- or under- estimated by the models. DHWM will consider soil gas sampling data as a method to establish the predictability of the model given unit-specific parameters, or to supplement the information given in the models. Soil gas sampling data can be used directly in the Johnson and Ettinger soil gas models and limits the uncertainty found in the soil and ground water models.

Soil gas sampling should meet the following conditions where possible:

-sampled within 10 meters of the building or potential building,
-collected within one year of ground water and/or indoor air data collection,
-collected between the months of December and February, and
-collected less than 2 meters below the building foundation.

In addition, Ohio EPA DHWM recommends that soil gas sampling should be done using U.S. EPA SOP# 2042 or ASTM method D 5314-92 and U.S. EPA Method TO-14A in conjunction. If methods for soil gas sampling other than these are used, the method and all corresponding documentation including instrument calibration, analytical results, etc. should be included as part of the closure plan.

Ohio EPA DHWM will not accept indoor air sampling data. The reasons for this include the overall difficulty in achieving sampling results that allow Ohio EPA or the facility to

reliably detect constituents of concern and determine what the source(s) of the constituents may be. In addition, indoor air sampling results are difficult to reliably replicate on different days and at different times, which makes determining an exposure point concentration impractical.

Limitations of the Johnson and Ettinger Models

Limitations of the models exist that may result in inaccurate predictions of vapor intrusion. The models assume a concrete foundation with cracks. If the foundation consists, for example, of an earthen floor and fieldstone foundation, the models cannot be used to predict vapor intrusion. Unit-specific measurements or calculations would be necessary. The models also assume no openings, including open sumps, between the building and the contamination. If an open sump is present, specific calculations need to be performed to assess the amount of vapor intrusion from the sump. These calculations cannot be added to the Johnson and Ettinger models at this time. Other problems that may arise include severely cracked concrete floors and/or walls, or pavement being placed entirely above the source and around the building or potential building. Please contact the Central Office Risk Assessment Section for further information or help if the unit has any of the limitations discussed in this section.

In some cases, the Johnson and Ettinger models may also overestimate the risk from vapor intrusion. This can occur if a fresh water lens exists above the contamination, if significant biodegredation is occurring, and if other situations exist that are not accounted for by the model. If the facility suspects that for any reason the models may be overpredicting the risk from vapor intrusion, the facility may establish why and how the overprediction is occurring, and what the more accurate risk assessment should be.

Examples of When to Evaluate Vapor Intrusion in a Risk Assessment

Example 1

A facility has a unit undergoing an industrial closure. Soil is the only contaminated media, and it has been determined that leaching is not a concern. Volatile organic compounds are among the constituents of concern. Although the property will be deed restricted to industrial use only, the unit is large enough to support a building, and there is no deed restriction against enclosed structures or future excavations. Both excavation workers and potential indoor industrial employees are the receptors. For excavation workers, vapor intrusion is not a reasonable exposure pathway because these receptors will be working out of doors. The equations found in Appendix H of Part II of the CPRG should be used to calculate inhalation intake and risk.
For industrial workers, the vapor intrusion pathway should be considered because future use of the land may include a building in which industrial receptors work. First, the risk to indoor workers should be calculated as directed in Appendix H of Part II of the CPRG. In addition, the Johnson and Ettinger vapor intrusion models should be used to calculate the risk for the constituents that meet the volatilization criteria. Both the total risk calculated according to the CPRG and the total risk from the vapor

intrusion pathway should meet the DHWM risk goals of a hazard index of less than 1 and a cancer risk of less than $1x10^{-5}$.

Example 2

A facility has a unit undergoing a closure that must be cleaned to unrestricted residential standards. Volatile organic compounds are among the COCs. Potential receptors include excavation workers, industrial workers, and residents. Because excavation workers primarily work outside, the vapor intrusion pathway does not need to be assessed. The equations found in Appendix H (and the construction worker supplement?) should be used to calculate risk to these receptors. Industrial workers are assumed to work in a building for the duration of the work day, so the vapor intrusion model should be used for these receptors. As in Example 1, the risk to indoor workers should be calculated as directed in Appendix H of Part II of the CPRG. Then, the Johnson and Ettinger vapor intrusion models should be used to calculate the risk for the constituents that meet the volatilization criteria. Both the total risk calculated according to the CPRG and the total risk from the vapor intrusion pathway should meet the DHWM risk goals of a hazard index of less than 1 and a cancer risk of less than $1x10^{-5}$. Risk to the residential receptor should be calculated in the same manner as risk to the indoor worker, using residential exposure assumptions.

Table 1 Parameters Necessary for Soil and Ground Water Model Calculations[1]

Parameter	Soil Screening	Soil Advanced	Ground Water Screening	Ground Water Advanced	Default Available?[4]

Subject: Closure Certification

Michael,

After looking over the closure certification for Campbell's Former Holding Pit, I see that in Section 5.2, Post Treatment Closure Strategy, 26 chemicals of concern (COC) were eliminated during the remediation of the site. Please send me a table of these chemicals that were eliminated. I am also requesting a description of the location, sample ID, depth, concentration, and any other pertinent information about the sample where these 26 COCs were found (or not found) throughout the closure process. If these were not found at all, please state this in a paragraph and list all samples they were not found in (IE, clean soil, intermediate soil, confirmation samples). A narrative paragraph as to why these were left out of the end residual risk calculation would also be appreciated. I'm looking for something that could be as simple as "The chemicals listed in Table X were left out of the residual risk calculation because they were not found in any of the post closure samples and are thought to have been successfully treated"

Please email me a copy and also send a hard copy to the address listed below at your earliest convenience.

Please call me if you have any questions or concerns about this request.

Sincerely,

Kara Reynolds

Subject: Benzo(g,h,i)perylene

Kara,

I calculated a soil sat limit for benzo(g,h,i)perylene of 0.05 mg/kg. However, it being a solid, I don't think it matters in regard to free product.

Mylynda

RCRA Site Closure Certification Report

Dear Ms. Reynolds:

This is to inform you that all the soil remediation and closure activities at Campbell Soup Company's site located at 1273 State Route 110, Napoleon, Ohio, have been completed on May 15, 2003 according to the approved RCRA Closure Work Plan.

Enclosed please find copies of a "Certification Report" prepared by GeoTrans, Inc., an independent registered professional engineer, certifying that the facility has been closed in accordance with the specifications in the approved closure plan. The certification was prepared following the format specified in OAC rule 374-5-50-53(D).

We would appreciate your review and approval of this certification report at your earliest convenience. If you have any questions, please call me at (856) 968-4423, or Michael Kovacich at (734) 213-5024.

Sincerely,

CAMPBELL SOUP COMPANY

Demolition Debris In The Former Holding Pit

Dear Ms. Reynolds:

During recent excavations in the former holding pit area, Campbell Soup representatives confirmed the presence of demolition debris in the northeast corner of the excavation, near monitoring well MW-3. The debris included items such as concrete, rebar, and asphalt and existed as a 6-inch to 1-foot layer along the sidewall in confirmation sample grid cell number 41. An initial confirmation sample was collected in this location and on March 17, 2003, a more representative sample was collected under the supervision of James Moseley of the Ohio EPA. These sampling results will be presented in the project certification report. To the best of our knowledge, this material was the result of construction and/or demolition activity that took place on the property many years ago, possibly during the timeframe of after 1955 and prior to 1970.

If you have any questions regarding this request, please do not hesitate to call me at 419 592-1010, or contact Mr. Michael Kovacich at 734 213-5024.

Sincerely,

CAMPBELL SOUP COMPANY

David Parcher
