Plant Manager – Napoleon Plant

From: Kara Reynolds
To: mkovacich@geotransinc.com
Date: 6/10/03 12:37PM
Subject: Campbell Soup Napoleon Certification Report

Mike,

As stated yesterday in our phone conversation, on May 15, 2003 the offsite disposal to Henry County Landfill was completed. Ohio EPA recognizes May 15, 2003 as the last day of field work. According to the Closure Plan, a certification report will be submitted to Ohio EPA 60 days after the completion of the field work. Therefore, the Certification Report is due to Ohio EPA on July 14, 2003.

The Certification Report will include everything outlined in the Closure Plan along with the Investigative Results from Soil and Groundwater that were in question.

If you have other questions, please feel free to contact me.

Sincerely,

Kara Reynolds

Subject: Campbell Soup Napoleon Certification Report Update

Kara,

Per our conversation earlier today we are seeking clarification from the district regarding the definition of field work which defines the due date for the certification report. The Closure Plan states that the certification report will be submitted to the Ohio EPA 60 days after the completion of the field work. The key field work activities were completed on the following dates:

April 16, 2003, completed clean and treated soil backfill.

April 18, 2003, completed grading of the backfill.

May 15, 2003, completed offsite disposal to Henry County Landfill.

We believe that the May 15, 2003 date represents an appropriate date for completion of field work since documentation of all offsite disposal of soil is required in the certification report.

We appreciate your assistance with this matter and look forward to your response.

Sincerely,

Michael Kovacich

Subject: Re: Questions

Kara,

Per our conversation today, we have completed a rough version of the text, figures and appendixes. The document will be reviewed internally within GeoTrans this week and will be reviewed by Campbell's next week.

Since backfill was completed on April 16, 2003, we plan to submit the report to you by June 16, 2003. Soil transportation to the Henry County Landfill was complete on May 15, 2003, but this date has not been confirmed with Mike Maringer in Napoleon. Mike has been out sick for the last week or so.

Please give me call in you have any questions

Sincerely,

Michael Kovacich

Dear Mr. Kovacich,
I received your voice mail concerning some questions about the certification report. I wasn't sure if you had received my message and
was wondering how the closure/certification report is coming along. Please call or email me any questions that you have and update me on activities.

Thank you,
Kara Reynolds

James,

Dr. Aly and Michael Maringer will be available for a conference call on Friday at 10:30 AM. Tesha and I will coordinate the call from our office. Please let me know what number we should use to reach you on Friday. We will provide a meeting agenda for your review on Thursday prior to the meeting.

Please give me a call if you have any questions,

Mike

Re: Follow-up Report
Discharge at Campbell Soup WWTP, Napoleon Facility

Dear Mr. Poffenbarger:

Discharge of field generated wastewater to the Campbell Soup Napoleon WWTP occurred during implementation of the *RCRA Site Closure Plan, Former Holding Pit Unit,* (Closure Plan) dated May 24, 2002. The following correspondence documents the discharge plan and the Ohio Environmental Protection Agency's (Ohio EPA) approval of the discharge:

- *Request for Permission to Discharge,* November 11, 2002, submitted by GeoTrans, Inc.
- *Addendum to November 11, 2002, Request for Permission to Discharge*, November 14, 2002, submitted by GeoTrans, Inc.
- Approval of Discharge Plan per Ohio EPA correspondence dated November 18, 2002.
- *Request to Change Discharge Procedures,* March 19, 2003, submitted by GeoTrans, Inc.
- Approval of Change in Discharge Procedures per Ohio EPA correspondence dated March 25, 2003.

This letter formally documents the discharges to the Campbell Soup Napoleon WWTP that occurred during implementation of the Closure Plan.

Per the approved discharge plan, perched water encountered during excavation activities was collected within the excavation and pumped to an on-site frac tank. Perched water within the excavation was pumped to the on-site frac tank (capacity 6,500 gallons) on February 28, 2002. Per the approved discharge plan one composite sample was collected from the frac tank.

The discharge plan was modified per the above correspondence, allowing Campbell to discharge perched water from the excavation directly to the head of the WWTP. As stated in GeoTrans *Request to Change Discharge Procedures* approximately 15,000 gallons of perched water was contained within the excavation. This water was pumped directly to a manhole located upstream of the head of the WWTP on March 25, 2003. On March 27, 2003, the water within the frac tank was discharged to a manhole located upstream of the head of the WWTP. Following de-watering activities additional perched water and runoff accumulated within the excavation. Therefore, a

final discharge event from the excavation to a manhole prior to the head of the WWTP occurred on April 7, 2003.

Table 1 contains the analytical data, which summarizes all perched water samples taken during investigation and remediation activities. Appendix A documents the laboratory report and chain of custody for the sample obtained from the frac tank, the laboratory report and chain of custody for the investigation samples are included in the Closure Plan. A summary of discharge durations is provided in Table 2. All discharge events were regulated at 40 gallons per minute. The total estimated volume of water discharged to the WWTP is approximately 29,000 gallons.

If you have any further questions or concerns, please call me at 734-213-5024.

Sincerely,

Michael Kovacich

Re: Request to Change Discharge Procedures
RCRA Closure Plan Implementation
Campbell Soup WWTP, Napoleon Facility

Dear Mr. Poffenbarger:

In follow-up to our phone conversation on March 14, 2003, we are formally requesting permission to discharge wastewater generated during implementation of the *RCRA Site Closure Plan, Former Holding Pit Unit,* (Closure Plan) directly to the Campbell Napoleon Wastewater Treatment Plant (WWTP)

BACKGROUND

In a November 18, 2002 correspondence, the Ohio Environmental Protection Agency (Ohio EPA) approved Campbell Soup to discharge field generated wastewater to the Napoleon WWTP during implementation of the Closure Plan. The approved plan for discharge required collection of all field generated wastewater in a frac tank on-site and confirmation sampling of the water prior to discharge. The approved plan requires discharge of the field generated wastewater to the head of the WWTP to obtain mixing with the WWTP influent and to subject the field generated wastewater to all treatment processes.

Approval of the analytical concentrations was based on a mass balance concentration between the field generated wastewater (not expected to exceed 56,000 gallons during field activities) and the influent wastewater (approximately 4 million gallons per day). Based on all investigation and confirmation samples of the perched water within the mound, the concentrations of the chemicals of concerns in the WWTP influent are estimated to be orders of magnitude lower than the outside mixing zone maximum (OMZM) values during discharge of the field generated wastewater.

Five samples from the perched water within the mound were collected during the investigation. During implementation of the Closure Plan one sample of the perched water was collected. Concentrations of the chemicals of concern in the perched water are shown in Table 1. The analytical data has demonstrated consistent detection of approximately 14 chemicals of concern, with consistent concentrations throughout the sample set. In addition, the concentrations of the select chemicals of concern have consistently remained orders of magnitude below the approved discharge values (Table 1).

CURRENT STATUS

Excavation activities were completed at the site on February 28, 2003. During the last phase of investigation approximately 15,000 gallons of perched water was encountered, and is currently contained within the excavation. A portion of this water was pumped to the on-site frac tank (6,500 gallons). This correspondence serves as formal notification, per the approved discharge plan, that the water in the frac tank will be discharged to the WWTP.

Due to the thawing weather conditions there is additional water contained in low spots within the mound from rainwater and snow melt. To expedite closing this site, which requires backfilling the excavation, Campbell wishes to discharge the water within the mound directly to the WWTP. This will expedite dewatering of the mound by avoiding mobing of a vacuum truck to transport the water from the tank to the head of the WWTP and time delays to collect and receive analytical results. The perched water has consistently demonstrated compliance with the approved discharge values (Table 1). Therefore, we request permission to discharge the field generated wastewater directly to the head of the WWTP.

If you have any further questions or concerns, please call me at 734-213-5024.

Sincerely,

Michael Kovacich
Senior Hydrogeologist

Re: Minor Change to Approved Closure Plan
Campbell Soup Company
Former Holding Pit
USEPA ID# OHD005419171

Dear Dr. Aly:

On March 7, 2003, Ohio EPA received a request for modification to an approved closure plan for Campbell Soup Company located at 1273 State Route 110, Napoleon, Ohio. The original closure plan was approved on August 1, 2002. The requested modification meets the criteria for submission and approval of an amended closure plan as detailed in Ohio Administrative Code rule 3745-66-12 (C)(3).

The requested amendment to the approved closure plan is as follows:

- The third paragraph on Page 20 of the approved closure plan is hereby amended to add the following at the end of the paragraph: "On-site treatment using medium temperature thermal desorption will be used to treat up to 3,300 cubic yards (5,000 tons)."

- The first paragraph on page 22 continued from page 21 of the approved closure plan is hereby amended to add the following at the end of the paragraph: "A total of 3,300 yards (approximately 5,000 tons) will be treated using medium temperature thermal desorption. If additional contaminated soils are encountered during the site excavation, these soils will be removed and properly disposed off-site at a licensed solid waste landfill."

- Section 9.2 of the approved closure plan is hereby amended to add the following at the end of the section: "A non-hazardous waste manifest, a bill of lading, or other appropriate documentation will be generated for all soil removed from the site."

Printed on Recycled Paper

- The second sentence of the last paragraph on page 29 of the approved closure plan is hereby replaced with the following: "The general strategy for meeting the cleanup numbers at the site involves removal through excavation and on-site treatment using medium temperature thermal desorption and offsite disposal of contaminated soil encountered above 3,300 yards (approximately 5000 tons) or any treated soil that does not meet the cleanup criteria following one pass through the treatment system."

With this letter, Ohio EPA approves the above referenced modification to the approved closure plan, submitted pursuant to Ohio Administrative Code Chapter 3745-66-12.

If you have any questions concerning this action, please contact James Moseley at Ohio EPA's Northwest District Office by telephone at (419) 373-3015.

Sincerely,

Edwin J. Hammett
District Chief

Re: Minor Modification to RCRA Site Closure Plan
Former Holding Pit, Campbell Soup, Napoleon, Ohio

Dear Mr. Moseley:

Campbell Soup Supply Company (Campbell) has prepared this minor modification to the *RCRA Site Closure Plan (Closure Plan)* for the former holding pit unit in Napoleon, Ohio. A change in the closure plan activities has become necessary, due to changing site conditions. We have provided this document to explain the additional proposed activities to close this site and our proposed minor changes to the *Closure Plan*, dated May 24, 2002.

BACKGROUND

As outlined in Section 7.0 of the Closure Plan, thermal desorption treatment was chosen to remediate this site. Since beginning thermal treatment of the soils on December 12, 2002, the process has effectively destroyed VOCs in the soil. However, the thermal process did not completely destroy all of the SVOCs. For some portions of the elevated area, treated soil does not meet the unrestricted use criteria (clean-up criteria) established for the site.

Verification samples VR-03-04 and VR-03-05 collected from post treatment stockpiles #4 and #5, respectively, exhibit the highest concentrations of SVOCs and exceed the cleanup criteria established for the site. A potential source of the elevated SVOCs is roofing material (felts, flashing, and tar) that was encountered in the western portion of the excavation. Partially combusted pieces of roofing material were identified in post treatment stockpiles #4 and #5. Once the roofing material was identified, excavation activities were moved from the western portion of the elevated area, to the east, in the vicinity of the former holding pit. No roofing materials have been identified in this area. SVOC concentrations decreased in each post treatment stockpile sample, once excavation activities were moved to the former holding pit area.

Approximately 3,250 tons of additional contaminated soil has been encountered during excavation activities. The additional contaminated soil is attributable to the presence of contamination at higher elevations then expected, and in areas beyond the extent estimated during the remedial investigation. Approximately 1,000 additional tons of SVOC contaminated soil was encountered at an elevation of 685 feet, 2-feet above the closure plan delineation. The remaining 2,250 additional tons were primarily encountered along the western and southern portions of the elevated area were the ramp was constructed and where the ditch (old access road) is present.

CURRENT PROJECT STATUS

Thermal processing of the soil ceased on February 20, 2003, after approximately 5,750 tons of soil had been processed (approximately 4,950 tons of excavated soil and 800 tons of mixing soil). Thermal treatment was suspended for the following reasons:

- Treated soil containing roofing materials did not meet the clean-up criteria following one pass through the treatment system;
- Increase in the quantity of soil that needs to be removed from the site due to contamination extending beyond the limits of the delineation line;
- Propane use increased significantly during treatment due to high soil moisture content attributable unusually heavy rain and snow melt; and
- Propane costs increased significantly during the project.

Currently, we estimate that 3,000 tons of contaminated soil will be excavated from the elevated area (2,000 tons of SVOC soils and 1000 tons of soil from the former holding pit area). In addition, we estimate that there is approximately 500 tons of soil stockpiled at the thermal plant staging area. Therefore, approximately 3,500 tons of untreated soil still requires treatment or disposal.

Through discussions with the Ohio EPA toxicologist, we have determined that Campbell will use post closure conditions to close the site. As outlined in our consultant's (GeoTrans, Inc.) correspondence dated January 15, 2003, a statistical approach using GCN's will be used to obtain unrestricted closure of this site. When the results from samples collected from post treatment stockpiles #4, #5 and #11 are included in the statistical analysis, the site does not meet the unrestricted use criteria. In order to meet unrestricted criteria, these stockpiles (approximately 1,200 tons) will require additional treatment or disposal.

PROPOSED MINOR MODIFICATION TO CLOSURE PLAN

Campbell proposes disposing the soil offsite at two separate licensed facilities. Approximately 3,500 tons of untreated contaminated soil will be disposed offsite at the Williams County Solid Waste Landfill. The 1,200 tons of treated soil from stockpiles #4, #5 and #11 will disposed of off site, as daily cover at the Henry County Solid Waste Landfill.

In order to receive approval for offsite disposal of contaminated soil from the North West District Office, we request that the following minor modifications be made to the *Closure Plan*:

Page 20, third paragraph, please add the following sentence as the second sentence in that paragraph:

> On site treatment using medium thermal desorption will be used to treat up to 3,300 cubic yards (5,000 tons).

Page 22, first paragraph continued from page 21, please add the following sentences as the third and fourth sentences in that paragraph:

> A total of 3,300 yards (approximately 5,000 tons) will be treated using medium temperature desorption. If additional contaminated soils are encountered during the site excavation, these soils will be disposed offsite at an approved solid waste landfill.

Page 26, please add the following section following Section 9.2:

9.2 Offsite Disposal of Soil
Non hazardous waste manifest, bill of lading or other appropriate documentation will be generated for all soil removed from the site.

Page 29, last paragraph, please replace the second sentence with the following sentence:

The general strategy for meeting the cleanup numbers at this site involves removal through excavation and on-site treatment using medium thermal treatment thermal desorption and offsite disposal of contaminated soil encountered above 3,300 yards (approximately 5000 tons) or any treated soil that does not meet the cleanup criteria following one pass through the treatment system.

SCHEDULE

We are not proposing any changes to the current schedule as presented in our January 13, 2003 and February 10, 2003 letters to the Ohio EPA.

If you have any questions or wish to discuss any aspect regarding this minor modification to the *Closure Plan*, please do not hesitate to call me at 856 968-4423 or Michael Kovacich at 734-213-5024.

Sincerely,

Osman M. Aly, Ph. D.

Re: Closure Period Extension
Campbell Soup Company
Former Holding Pit
USEPA/OEPA ID# OHD005419171

I certify this to be a true and accurate copy of the official document as filed in the records of the Ohio Environmental Protection Agency.
By: Jona L Clemente Date: Feb, 20 03

Dear Dr. Aly:

On January 13, 2003, the Campbell Soup Company (Campbell), located at 1273 State Route 110, Napoleon, Ohio, submitted a request for an extension to the closure period specified in the approved closure plan dated August 8, 2002, of ninety-three days, until May 1, 2003. The extension request was submitted pursuant to Ohio Administrative Code (OAC) rule 3745-66-13(B) as closure will require longer than the 180 day period specified in OAC rule 3745-66-13. Campbell has requested this extension because uncharacteristically warm and wet weather in December has resulted in delays due to the need to construct temporary roads for support of heavy equipment. Several instances of equipment failure have also hampered Campbell's ability to meet the deadlines in the closure plan.

My staff reviewed your request for an extension to the closure period and recommends that the extension be granted per OAC rule 3745-66-13(B). I concur and am therefore granting this extension request. This extension is being granted for the above referenced closure plan and expires on May 1, 2003.

Campbell shall continue to take all steps to prevent a threat to human health and the environment from the unclosed, but inactive waste management unit per OAC rule 3745-66-13(B)(2).

Please be advised that approval of this closure extension request does not release Campbell from any responsibilities as required under the Hazardous and Solid Waste Amendments of

1984 regarding corrective action for all releases of hazardous waste or constituents from any solid waste management unit, regardless of the time at which waste was placed in the unit.

You are hereby notified that this action of the Director of Environmental Protection is final and may be appealed to the Environmental Review Appeals Commission pursuant to Ohio Revised Code section 3745.04. The appeal must be in writing and set forth the action complained of and the grounds upon which the appeal is based. The appeal must be filed with the commission within 30 days after notice of the director's action. Notice of the filing of the appeal shall be filed with the director within three days after the appeal is filed with the commission. An appeal may be filed with the commission at the following address:

Environmental Review Appeals Commission
236 East Town Street
Room 300
Columbus, Ohio 43215

When closure is completed, OAC rule 3745-66-15 requires the owner or operator of a facility to submit to the director of Ohio EPA, certification by the owner or operator and an independent, registered professional engineer that the facility has been closed in accordance with the specifications in the approved closure plan. The certification shall follow the format specified in OAC rule 3745-50-42(D), and should be submitted to: Ohio Environmental Protection Agency, Division of Hazardous Waste Management, Attn: Pamela Allen, Regulatory and Information Services Section, P.O. Box 1049, Columbus, Ohio 43216-1049.

Sincerely,

Christopher Jones

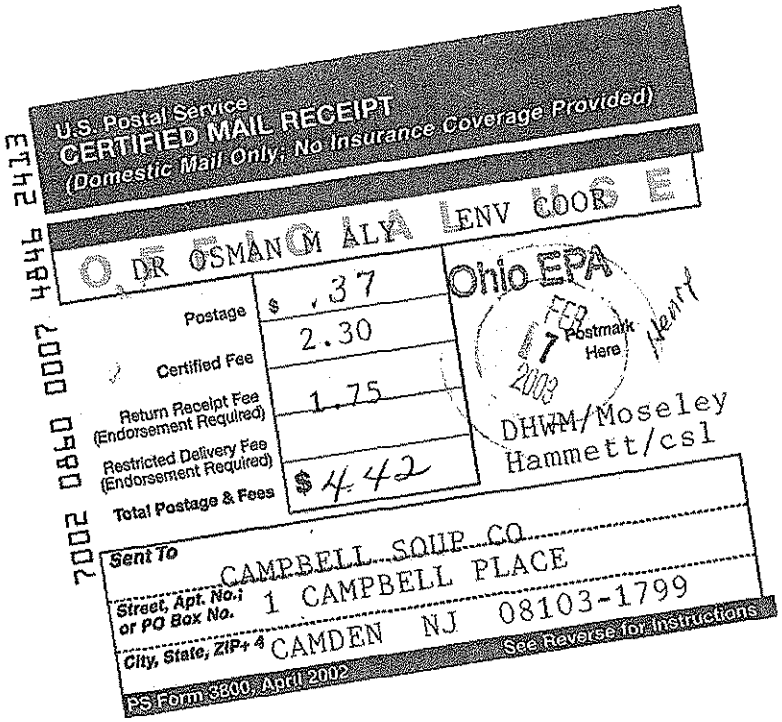
RE: Campbell Soup Company, Napoleon Site
Amendment - Revision to RCRA Schedule to Closure

Dear Mr. Moseley:

This letter is intended as an amendment to our January 13, 2003, letter regarding a revision to RCRA schedule for closure at the Napoleon Site. In the letter, we revised the last four dates listed in the RCRA closure plan. February 18, 2003 was listed for completion of soil excavation and treatment as well as collection of verification samples. February 18, 2003 was not our intended date. To better coincide with the schedule presented in the RCRA closure plan and the subsequent activities presented in the January 13, 2003 correspondence, we are requesting the following revision to the schedule:

Complete Excavation and Soil Treatment and Collect Closure Verification Samples	March 17, 2003

If you have any questions regarding this request, please do not hesitate to call me at 856 968-4423, or contact Mr. Michael Kovacich at 734 213-5024.



Sincerely,

CAMPBELL SOUP COMPANY

Re: Minor Change to Approved Closure Plan
Campbell Soup Company
Former Holding Pit
USEPA ID# OHD005419171

Dear Dr. Aly:

On January 29, 2003, Ohio EPA received a request for modification(s) to an approved closure plan for Campbell Soup Company located at 1273 State Route 110, Napoleon, Ohio. The original closure plan was approved on August 1, 2002. The requested modification meets the criteria for submission and approval of an amended closure plan as detailed in Ohio Administrative Code rule 3745-66-12 (C)(3).

The requested amendment to the approved closure plan is as follows:

> Page 21 of the approved closure plan is hereby modified to state: "Small amounts of rejected material that cannot be adequately treated shall be taken to a licensed solid waste landfill and be properly disposed. Documentation shall be provided in the form of bills of lading or other equivalent documentation and shall be included in the certification report required by the approved closure plan."

With this letter, Ohio EPA approves the above referenced modification to the approved closure plan, submitted pursuant to Ohio Administrative Code Chapter 3745-66-12.

If you have any questions concerning this action, please contact James Moseley at Ohio EPA's Northwest District Office by telephone at 419-373-3015.

Sincerely,

Edwin J Hammett
Chief Northwest District Office

INTER-OFFICE COMMUNICATION

TO: Ed Hammet, District Chief, NWDO

FROM: James Moseley through Michael Terpinski, DHWM, NWDO

SUBJECT: *Approval of minor modification to closure plan*

DATE: February 5, 2003

On January 29, 2003, Campbell Soup Company submitted a request to modify their closure plan to allow small amounts of reject material to be taken to a licensed solid waste landfill. The approved closure plan states that all soil material above the levels specified in the closure plan would be treated on site. This has proved to be problematic for a small amount of the material which is mixed with other solid waste debris. The presence of this debris prevents the material from being screened and treated and further separation is not practical. The rejected material is not a listed material and is not characteristically hazardous. Please contact me and/or James Moseley if you would like additional information.

The Division of Hazardous Waste Management (DHWM) has reviewed this closure plan modification request and recommends it be approved.

James Moseley - Update on Campbell Napoleon RCRA Site

From: "Tesha Yielding" <tyielding@geotransinc.com>
To: <James.Moseley@epa.state.oh.us>
Date: 01/28/2003 5:57 PM
Subject: Update on Campbell Napoleon RCRA Site
CC: "Michael Kovacich" <mkovacich@geotransinc.com>

James,

I just wanted to give you a quick update on the activities at the Campbell RCRA site in Napoleon - Due to low temperatures the plant was shut down at the end of last week, we did not treat any soil on Thurs, Fri (1/23&1/24) or Monday of this week. The plant is up and running today - however, I am not on site today. I will be on-site tomorrow afternoon at the earliest, possibly not until Thurs morning - but I should be on-site Thurs for most of the day and Friday morning.

As of this afternoon we have treated approximately 2500 tons on-site, ½ of the estimated 5000 tons within our delineation line.

We now have a roll-off box on site to collect all the metal debris generated during the excavation activities. We would like to dispose of this debris at a non-hazardous landfill. We believe a non-haz landfill is appropriate for all debris generated at the site, and any soil excavated on-site that is not thermally treated. At this time we are not planning on sending any soil to a landfill, we would like to treat it all, however, some of the reject material may have to go to a landfill. From earlier discussions with you we are under the impression we can send waste to a landfill as long as it is not a large percentage of the 5000 tons of material we expect to excavate at this site. Also, we would need a waste manifest for all material taken off-site. Implementation of the waste characterization sampling plan (Sec 14.4 of the Closure Plan) determined the soils at this site are non-hazardous (analytical results from the TCLP analysis were sent to you in two separate correspondences, dated 8/21/2002 and 8/30/2002). Therefore, we believe we can take this waste to a non-haz landfill. Are you in agreement with this, and if we take it (metal debris and possibly soils from the site) to a non-haz landfill would a bill of lading be acceptable to the Ohio EPA in place of a waste manifest?

Thanks for your input,
Tesha

RE: Campbell Soup Company, Napoleon Site
Estimates of Residual Risk

Dear Ms. Shaskus,

As we discussed on January 9, 2003, GeoTrans, Inc., intends to reevaluate the remedial action cleanup criteria by calculating risk associated with exposure to treated and untreated soils using GCNs. The maximum detected concentrations of each chemical will be divided by its GCN and the ratios will be summed to determine if the risks and hazard indices are acceptable. If the sum of the ratios exceeds 1.0, then the upper 95th confidence limit of the arithmetic mean will be calculated and the ratios will be recomputed. If the ratios still exceed 1.0, other methods will be used to calculate risk at the site.

It is our understanding that you concur with this approach, and that new criteria established using these methods will be acceptable to the Ohio EPA. If this is not the case, please contact us at your earliest convenience. We will forward the revised risk numbers to you for review when we are confident that the maximum concentrations for each residual chemical of concern are known.

If you have any questions regarding these matters please do not hesitate to give me a call at 734-213-5024.

Sincerely,

Michael Kovacich

RE: Campbell Soup Company, Napoleon Site
Revision to RCRA Schedule to Closure

Dear Mr. Moseley:

Campbell Soup Company initiated RCRA closure and excavation activities at the Napoleon, Ohio Plant (former holding pit unit) during the week of December 9, 2002. This was in advance of the schedule presented in our OEPA approved RCRA Closure Plan. However, the uncharacteristically warm weather we have experienced over the past three weeks and the on-set of wet weather has resulted in the need to construct a temporary road capable of supporting heavy equipment, and the need to obtain sand to reduce the moisture content of the soil prior to treatment. These conditions and several minor equipment repairs have resulted in the excavation and treatment proceeding at a pace slower than anticipated. Therefore, we are requesting a modification to the approved RCRA Closure Plan schedule.

According to the approved RCRA Closure Plan, the soil excavation and collection of the soil corrective action verification samples were to be completed by January 18, 2003. It now appears we will not be able to meet that schedule. We request that the OEPA amend our approved schedule to reflect completion of this task by February 18, 2003 and change the scheduled completion date for all subsequent activities dependent on this task as follows:

Receive results of closure verification	March 31, 2003
Conduct engineer inspection and certification of site closure	April 15, 2003
Complete excavation backfill and regarding	May 1, 2003

I would appreciate your approval at your earliest convenience. If you have any questions regarding this request, please do not hesitate to call me at 856 968-4423, or contact Mr. Craig Savage at 734 213-5042.

Sincerely,

Dear Mr. Maringer:

Thank you for your December 8, 2003, response to Ohio EPA's November 14, 2003, Notice of Violation letter. You submitted documentation including: a copy of the manifest for the video jet ink waste, a photo of the container label for this waste, a copy of the manifest for mercury thermometers and a photograph of the closed container of thermometers.

My review of this documentation reveals that Campbell Soup Company's Main Plant has adequately demonstrated abatement of the violation and adequate response to our general concern discovered during my October 29 and November 10, 2003, inspection.

If you have any questions, please contact me at (419) 373-3074.

Sincerely,

Don North

Date: 12/15/03 4:46PM
Subject: Long Lost Campbells

Well, I just received this from Mike K. They have some questions and they propose another statistical evaluation. I was wondering if this statistical evaluation was ok or not.

Specifically the following (right out of the e-mail)-I'm not 100% sure that this is what they proposed? Is the Wilcoxon Rank Sum the same thing as the Wilcoxon Signed Rank test?:

It is our understanding that the Ohio EPA and Campbell agree on the following statistical evaluation to determine the upper confidence limit for the chemicals of concern:

All samples within the closure unit will be used in the statistical evaluation. Because the sample concentration data do not follow a normal or log-normal distribution, Campbell has proposed the Wilcoxon Signed Rank nonparametric test of the median to calculate the confidence interval and 90th percentile upper confidence limit.

AND:

Question for Option a) Presented in the Ohio EPA December 8, 2003, Letter:

Campbell proposes using the detection limit as the data point for all non-detect samples in the risk assessment and statistical evaluation. Using the detection limit, instead of ½ the detection limit, will create an exposure point concentration in the detectable range. The exposure point calculation of the chemicals of concern will be calculated with the Wilcoxon Signed Rank Test and 90th percentile confidence as described above. Does the Ohio EPA approve the use of the detection limit for non-detect sample results in the risk assessment and statistical evaluation for this site?

Just and FYI-I spoke with Dr. Aly the day this was sent and as soon as I mentioned deed restriction, he got a little excited. I notice there are no questions from them concerning the deed restriction option, so I am assuming that they will not be pursuing this option under any circumstances.

Let me know when you get a chance to look at this and we can all talk.
Thanks,
Kara

Subject: Questions Regarding Ohio EPA's 12-08-03 Letter

Kara,

We received a copy of your letter dated December 8, 2003. We are currently reviewing the options presented in the letter. Please clarify the following items:

Proposed Risk Assessment and Statistical Evaluation

It is our understanding that the Ohio EPA and Campbell Soup Company (Campbell) have agreed on the following risk assessment methodology:

The maximum detected concentration or upper confidence limit (UCL) of each chemical of concern will be divided by its GCN and the ratios will be summed to determine if the risks and hazard indices are acceptable. A sum of the ratios less than 1.0 indicates that environment risk at the site is less than the Ohio EPA action level of 1E-5 and that the site will be closed with unrestricted use.

It is our understanding that the Ohio EPA and Campbell agree on the following statistical evaluation to determine the upper confidence limit for the chemicals of concern:

All samples within the closure unit will be used in the statistical evaluation. Because the sample concentration data do not follow a normal or log-normal distribution, Campbell has proposed the Wilcoxon Signed Rank nonparametric test of the median to calculate the confidence interval and 90th percentile upper confidence limit.

It is our understanding that you concur with this approach. Please let us know if the methods for risk assessment and statistical evaluation described above are acceptable to the Ohio EPA.

Question for Option a) Presented in the Ohio EPA December 8, 2003, Letter:

Campbell proposes using the detection limit as the data point for all non-detect samples in the risk assessment and statistical evaluation. Using the detection limit, instead of ½ the detection limit, will create an exposure point concentration in the detectable range. The exposure point calculation of the chemicals of concern will be calculated with the Wilcoxon Signed Rank Test and 90th percentile confidence as described above. Does the Ohio EPA approve the use of the detection limit for non-detect sample results in the risk assessment and statistical evaluation for this site?

Question for Option c) as Presented in the Ohio EPA December 8, 2003, Letter:

In general, how would the proposed core samples in the existing backfill be used to determine the validity of the present data? It is our understanding that the current data will be validated as follows:

Campbell proposes substituting the samples that have been currently used to represent the backfill (CS-02-01 through CS-02-17, IS-02-01 through IS-02-03, and VR-02-01 through VR-02-3, VR-03-06 and VR-03-08 through VR-03-14) with the results collected from the proposed core samples for use in future risk assessments. Therefore, future risk assessments will include all of the samples from the investigation that remain following remediation, the confirmation samples (excavation floor and sidewalls) and the new samples collected from the backfill. Following the substitution, we will use the risk assessment methods described above to determine if the site meets the conditions for unrestricted closure. Does the Ohio EPA agree with our understanding of option c)?

We appreciate your answers to these questions as soon as possible, so we can have a conference call to discuss our plans. Please feel free to propose some dates for a conference call.

Sincerely,

Michael Kovacich, CPG

Re: Former Holding Pit
RCRA Site Closure Certification Report
Campbell Soup Supply Company, Napoleon
OHD 005 419 171

Dear Dr. Aly:

On September 4, 2003, the Ohio Environmental Protection Agency (Ohio EPA) sent a Notice of Deficiency (NOD) to Campbell Soup Supply Company (CSC) for the *RCRA Site Closure Certification Report, Former Holding Pit Unit*. Comment 30 in the NOD requested that CSC perform statistical evaluations on the site data before completing the human health risk assessment. In response to our comment, CSC has submitted several documents and e-mails regarding a proposed statistical evaluation.

For risk purposes, CSC has chosen to use one-half the detection limit in the statistical determination of the exposure point concentration for certain chemicals. The facility used the Wilcoxon signed rank test and determined a 95% Upper Confidence Limit exposure point concentration that was well below the detection limit of the test. Even though the use of this procedure differs from Ohio EPA guidance, Ohio EPA does not disagree with the use of this statistical approach. However, Ohio EPA does not agree with the use of one half the detection limit with such highly censored data. According to U.S. EPA guidance, the use of one-half the detection limit is valid for statistical determinations, except in the case of highly censored datasets (see U.S. EPA, Guidance for Data Quality Assessment, 1998, section 4.73). Any statistical test using this type of data will determine an exposure point concentration that is biased to one half the detection limit value. This was indeed the case of the statistical evaluation submitted to Ohio EPA.

Ohio EPA cannot ignore the significance or the concentrations of samples with detections for a facility that is proposing a clean closure. In cases such as Campbell's, at other RCRA facilities, Ohio EPA requires either removal of impacted material or additional sampling to confirm the magnitude of contamination. However, the Campbell's facility presents something of a unique case because of the manipulation of soils after treatment activities had ceased. Therefore, Ohio EPA is willing to forego its normal procedure of having additional soil removed, if limited verification sampling is conducted to confirm that the soils will not pose a health risk now or in the future.

Ohio EPA is giving CSC the following options to choose from for determining the appropriate exposure and risk that contaminated media poses to human health and the environment.

a) CSC will be required to select a percentile, approved by Ohio EPA, of the highly censored data in the detectable range and use this value as the exposure point concentration in the risk assessment.

Printed on Recycled Paper

Ohio EPA has suggested the 90th percentile in the past; or

b) CSC will be required to sample the existing top layers of soil, using a Sampling and Analysis Plan (SAP) approved by Ohio EPA, to determine the existing exposure point concentrations for all chemicals of concern (COC). These concentrations will be used in place of the existing closure data to show the residential human health risk posed by the top layers of soil through direct contact pathways including ingestion, inhalation, and dermal exposure. This risk assessment will not include the entire unit and will leave out the undisturbed, contaminated soils below the top layers. If CSC passes the human health risk assessment, a deed restriction will be required that prohibits the soils in this area to be disturbed by CSC or any other owner/operator. This will be used to protect against future exposure from the undisturbed, impacted soils below the top layers. If CSC does not pass the risk assessment, then CSC will need to work with Ohio EPA to determine other options for closure (e.g., closing as a landfill per the approved closure plan letter); or

c) CSC will be required to take several core samples in the existing backfilled area, using a SAP subject to approval by Ohio EPA, to determine the validity of the present data. If the data is similar in both the new samples and the closure samples, then CSC will proceed with the proposed statistical evaluation and human health risk assessment as agreed upon by Ohio EPA. If the data indicates that it is not similar to the closure samples, then CSC will work with Ohio EPA to determine options for closure.

Ohio EPA would like to schedule a conference call with CSC to discuss these closure options. Please contact Kara Reynolds at (419) 373-3065 at your earliest convenience.

Sincerely,

Kara Reynolds

Subject: Re: Kara, We have prepared this e-mail to define our understanding of the telephone discussion we had ye

Tesha,

I believe your understanding of the December 8, 2003 letter is correct.

As for the elements of the SAP, there are still some items that have not been finalized yet. As Michael K. and I found out yesterday, we were not able to pinpoint sampling locations at the site. I believe the best way to proceed is to send Ohio EPA a letter letting us know which option from the December 8 letter you have chosen. As I discussed with Michael, an outline or draft of the SAP may be included. Then we can schedule a conference call to discuss all of the details that need to be included in the final SAP, including but not limited to, number of samples, depth of samples, sample locations, etc.

The elements that you listed in the December 30, 2003 e-mail seem like a good start to the SAP.

As always, let me know if you have any questions.

Have a safe and happy New Year!

Subject: Kara, We have prepared this e-mail to define our understandingof the telephone discussion we had ye

Kara, We have prepared this e-mail to define our understanding of the telephone discussion we had yesterday, December 29, 2003. Our understanding of Ohio EPA Option a) is to perform statistical analysis with only those samples exhibiting concentrations of the chemicals of concern above the method detection limit. The Ohio EPA would consider an exposure point concentration based on a percentile less than 90 on a case by case basis. The Ohio EPA would have to review a least one worked example of the calculation prior to approving this option. Our understanding of Ohio EPA Option c) is to develop a Sampling and Analysis Plan (SAP) to collect soil samples to validate the existing data currently used to characterize the backfill (the CS, IS and VR sample series). If the new data is consistent with the previous data, then Campbells will proceed with the statistical and risk assessment methods as discussed previously with the Ohio EPA. The following is our understanding of the elements of the SAP: A minimum of four soil borings will be completed in the backfill
2 soil samples will be collected from each boring (shallow and deep)
The new analytical results will be evaluated by the Ohio EPA to determine whether the backfill sample series are representative of current conditions.
If the data is consistent all samples within the closure unit (including the eight new samples from the backfill, the previous samples from the backfill, and all other remaining samples) will be used to perform a risk assessment. Samples that do not exhibit a concentration above the detection limit will be included in the assessment at ½ of the detection limit.
The specifics of the statistical analysis and risk assessment methods will be included in the SAP for the Ohio EPAs approval.
Campbells would like to proceed with the preparation of a draft SAP for your review provided that our understandings presented above are accurate.

Campbell Soup 2003 Oct-Dec File

Campbell Soup Supply Company File Henry Co Napoleon, OH

From: Kara Reynolds
To: mkovacich@geotransinc.com
Date: 12/23/03 8:31AM
Subject: CSC Questions

Michael,

Here are answers to your questions from the December 15, 2003 e-mail. Ohio EPA changes/comments/corrections are in bold.

Risk Assessment
The procedure that you included in the e-mail is accepted by Ohio EPA as long as the following changes are incorporated.

The maximum detected concentration or **95% Upper Confidence Limit** (UCL) **(unless otherwise agreed upon by Ohio EPA)** of each chemical of concern will be divided by its **Cancerous and Non-Cancerous GCNs** and the ratios will be summed to determine if the risks and hazard indices are acceptable. A sum of the **Non-Cancerous** ratios **that is 1.0 or** less **and a sum of the Cancerous ratios that, when multiplied by 10^-5, is 1E^-5 or less,** indicates that environmental risk at the site is less than the Ohio EPA action level and that the site will be closed with unrestricted use.

Statistical Evaluation Proposed by CSC
All samples within the closure unit will be used in the statistical evaluation. **TRUE.**

Because the sample concentration data do not follow a normal or log-normal distribution, Campbell has proposed the Wilcoxon Signed Rank nonparametric test of the median to calculate the confidence interval and 90th percentile upper confidence limit.

Ohio EPA does not agree that the Wilcoxon Sign Rank Test is an appropriate statistical procedure for calculating an exposure point concentration. Ohio EPA does not agree that this is the best, or even a valid statistical approach. However, Ohio EPA did demonstrate that similar results can be obtained with the test of proportions and the signed rank test. But, Ohio EPA believes that the similarity may be a consequence of the highly censored nature of the data. With this being said, Ohio EPA will allow CSC to use this test, but only in this instance. This is not a proper statistical procedure for other sites or other scenarios.

Option A
Question for Option a) Presented in the Ohio EPA December 8, 2003, Letter:

Campbell proposes using the detection limit as the data point for all non-detect samples in the risk assessment and statistical evaluation. Using the detection limit, instead of ½ the detection limit, will create an exposure point concentration in the detectable range. The exposure point calculation of the chemicals of concern will be calculated with the Wilcoxon Signed Rank Test and 90th percentile confidence as described above. Does the Ohio EPA approve the use of the detection limit for non-detect sample results in the risk assessment and statistical evaluation for this site?

Ohio EPA believes that using the detection limit, instead of ½ the detection limit, is a favorable procedure as there is more of an opportunity to have exposure concentrations in the detectable range. However, this may not be the case. Ohio EPA will need to know which detection limit CSC wishes to use since there were several detection limits used in the closure. In addition, Ohio EPA would need to have a presentation of at least one worked example of the procedures and data manipulations for our own evaluation purposes. Finally, Ohio EPA has consistently advocated (according to EPA QA/9) that an exposure point concentration be determined from the detected concentrations in the data set. It is not clear as to whether the statistical procedure proposed by CSC will generate an exposure point concentration in the detectable range other than the

detection limit.

Option C
Question for Option c) as Presented in the Ohio EPA December 8, 2003, Letter:

In general, how would the proposed core samples in the existing backfill be used to determine the validity of the present data? It is our understanding that the current data will be validated as follows:

Campbell proposes substituting the samples that have been currently used to represent the backfill (CS-02-01 through CS-02-17, IS-02-01 through IS-02-03, and VR-02-01 through VR-02-3, VR-03-06 and VR-03-08 through VR-03-14) with the results collected from the proposed core samples for use in future risk assessments. Therefore, future risk assessments will include all of the samples from the investigation that remain following remediation, the confirmation samples (excavation floor and sidewalls) and the new samples collected from the backfill. Following the substitution, we will use the risk assessment methods described above to determine if the site meets the conditions for unrestricted closure. Does the Ohio EPA agree with our understanding of option c)?

Ohio EPA does not agree with CSC's proposal of option c.

Ohio EPA proposes using more of an examination procedure, at least initially, than a strict statistical procedure. Ohio EPA would evaluate the results from the core samples and see if any constituents of concern are present. If present, Ohio EPA would examine the results to see if they are in the range of concentrations found in the previous sampling results. If they are commensurate with the majority of the results in the past (basically at or near the detection limit), then Ohio EPA would agree with CSC's exposure concentration approach and CSC could derive a statistical exposure point concentration. If, on the other hand, results are found to be near the upper range of concentrations, Ohio EPA would reserve the right to have additional characterization samples taken. This may involve extensive resampling of the soil in the pit area.

As far as substituting sample results, Ohio EPA is opposed to this approach. Ohio EPA must use all available (valid) results in expressing an exposure point concentration. If Campbells feels that these samples are non-representative, Ohio EPA needs to know now, so that a new sampling program can be instituted to determine an exposure point concentration.

Please call if you need more clarification.

"Campbell Soup 2003 Oct-Dec" File

Campbells Soup Supply Company Napoleon - Henry Co

From: Erik Hagen
To: Kara Reynolds
Date: 12/19/03 11:57AM
Subject: Re: Long Lost Campbells

Kara,

I wanted to give you my impressions on Campbells proposals, since we may not meet up before the holidays. I talked to Stephanie Beak too, so this response is something amalgamation of our impressions.

1. I can live with Campbells using the Wilcoxon Signed Rank test. However, the assertion that we agree with the Wilcoxon Sign Rank Test as a appropriate statistical procedure for calculating an exposure point concentration is not correct. We have never agreed that this is the best or even a valid approach. We did demonstrate that similar results can be obtained with the test of proportions and the signed rank test. However, the similarity may be a consequence of the highly censored nature of the data that were examining.

2. Campbells has proposed to use the detection limit instead of one-half the detection limit in the statistical procedures for the exposure point concentration. This procedure is favorable as there is more of a opportunity to have exposure concentrations in the detectable range. However, The Ohio EPA will need to know which detection limit (there were several) that the facility wishes to use. In addition, I believe that we would have to have a presentation (at least one worked example) of the procedures and data manipulations for our own evaluation purposes. Finally, we have consistently advocated (according to EPA QA/9) that a an exposure point concentration be determined from the detected concentrations in the data set. It remains to be seen that the statistical procedures used by Campbells will generate a exposure point concentration in the detectable range other than the detection limit.

3. The question about option c is valid. I would propose using more of an examination procedure, at least initially, than a strict statistical procedure. I would evaluate the results from the cores and see if the any constituents of concern are present. If present, I would examine the results to see if they are in the range of concentrations found in the previous sampling results. If they are commensurate with the majority of the results in the past (basically at or near the detection limit), then we would agree with their exposure concentration approach and they could derive a statistical exposure point concentration. If, on the other hand, results are found to be near the upper range of concentrations, we would reserve the right to have additional characterization samples taken. This may involve extensive resampling of the soil in the pit area.

As far as substituting sample results. We would be opposed to this approach. We must use all available (valid) results in expressing an exposure point concentration. If Campbells feels that these samples are non-representative, we need to know now, so that a new sampling program can be instituted to determine an exposure point concentration.

Happy Holidays!

Erik

>>> Kara Reynolds 12/15/03 04:46PM >>>
Well, I just received this from Mike K. They have some questions and they propose another statistical evaluation. I was wondering if this statistical evaluation was ok or not.

Specifically the following (right out of the e-mail)-I'm not 100% sure that this is what they proposed? Is the Wilcoxon Rank Sum the same thing as the Wilcoxon Signed Rank test?:

It is our understanding that the Ohio EPA and Campbell agree on the
following statistical evaluation to determine the upper confidence limit
for the chemicals of concern:

All samples within the closure unit will be used in the statistical evaluation. Because the sample concentration data do not follow a normal or log-normal distribution, Campbell has proposed the Wilcoxon Signed Rank nonparametric test of the median to calculate the confidence interval and 90th percentile upper confidence limit.

AND:

Question for Option a) Presented in the Ohio EPA December 8, 2003, Letter:

Campbell proposes using the detection limit as the data point for all non-detect samples in the risk assessment and statistical evaluation. Using the detection limit, instead of ½ the detection limit, will create an exposure point concentration in the detectable range. The exposure point calculation of the chemicals of concern will be calculated with the Wilcoxon Signed Rank Test and 90th percentile confidence as described above. Does the Ohio EPA approve the use of the detection limit for non-detect sample results in the risk assessment and statistical evaluation for this site?

Just and FYI-I spoke with Dr. Aly the day this was sent and as soon as I mentioned deed restriction, he got a little excited. I notice there are no questions from them concerning the deed restriction option, so I am assuming that they will not be pursuing this option under any circumstances.

Let me know when you get a chance to look at this and we can all talk.
Thanks,
Kara

Don North – District Representative

Dear Mr. North,

December 8, 2003

To correct the measures as stated in your letter dated November 14, 2003, to Campbell Soup Supply Company (OHD 005419171), the following items have been completed.

Beverage Plant

The Video Ink Jet Waste (F005), A telephone call was made to Heritage Environmental Services to correct the determination of this waste from D001 to F005. On November 21, 2003, Heritage removed the two waste ink drums from the Main Plant and Beverage Plant (see Manifest Attached). To further clarify this determination, a F005 sticker was placed on the new accumulation drums.

Waste Thermometers (D009) The thermometers observed during the inspection were removed by Heritage Environmental Services (see attachment) on November 1, 2003. To provide better awareness on open lids, a sticker was placed on the accumulation drum stating "Keep Lid Closed". Also, personnel were instructed to call my extension when the drum is three quarters full to prevent raised lids.

Please contact me if you have any additional questions.

16. **GENERATOR'S CERTIFICATION:** I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

Date: 11/18/03 5:10PM
Subject: Detailed Explanation of Proposed Statistics for the CSCNapoleon Risk Assessment

Kara,

We have prepared a explanation and example hand calculation detailing the Wilcoxon Rank Sum method. We plan to use this method to determine the 95 percentile for the four PAHs of concern.

Please review the attached file in preparation of our next conference call.

Thank you,

Michael Kovacich, CPG

Calculating the 1-Sample Wilcoxon Rank Sum Confidence Interval

The Wilcoxon Rank Sum (WRS), also known as Wilcoxon Signed Rank, nonparametric test is used when the data do not follow a normal or lognormal population distribution. EPA Guidance for Data Quality Assessment indicates the Wilcoxon Rank Sum is the preferred nonparametric test for data that are heavily censored (containing a high percentage of non-detect values).

Nonparametric tests do not assume a specific mathematical form for the underlying population distribution. As a result, they perform well for a wide variety of distributions, and outliers do not unduly affect the test's performance. WRS is robust with respect to outliers because the analysis is conducted in terms of ranks of the data. This limits the influence of outliers because a given data point can be no more extreme than the first or last rank.

WRS assumptions:

1. The sample is random
2. The variable is continuous
3. The measurement scale is at least interval.

Example Calculation: For ease of the following hand calculations, a relatively small data set was selected for the example calculation. The selected data set is the Benzo(a)pyrene (BaP) analytical results from 34 samples collected from the excavation backfill. The 34 continuous variables are presented in the attached excel spreadsheet.

Step 1: Calculate $W(i) = (X_i+X_j)/2$ = all pairwise averages for $i \leq j$.

For BaP, this calculation results in 595 pairwise averages. This creates an approximate normal distribution from which a median value Confidence Interval is estimated.

Step 2: Sort the pairwise averages in numerical order from lowest to highest.

Step 3: Calculate the endpoints of the $(1-\alpha)*100\%$ confidence interval by solving for $Z_{(1-\alpha/2)}$. In this case, Z for the 95% Confidence Interval is 1.9600.

Step 4: Calculate d.

$$d \approx \frac{n+1}{4} - 0.5 - Z \qquad \sqrt{n\frac{(n+1)(2n+1)}{24}}$$

For BaP:

$$d \approx \frac{34\times 35}{4} - 0.5 - 1.9600 \sqrt{34\frac{(35)(69)}{24}}$$

$d \approx 183$

Step 5: Using the notation above, the lower endpoint of the confidence interval is W(d+1) and the upper endpoint is $W(n_w\text{-}d)$, where n_w is the number of pairwise averages.

W(d+1) = W(183+1) = The 184^{th} pairwise average = 165
$W(n_w\text{-}d)$ = W(595-183) = The 412^{th} pairwise average = 323

Henry County
CESQG/TSD
Notice of Violation

November 14, 2003

Mr. Michael Maringer
Manager, Services & Utilities
Campbell Soup Company
12-773 St. Rt. 110
Napoleon, Ohio 43545

Dear Mr. Maringer:

Thank you for accompanying me during Ohio EPA's October 29 and November 10, 2003, inspection of Campbell Soup Company's (CSC-MP) Main Plant (OHD 005419171) at 12-773 St. Rt. 110 in Napoleon, Ohio. We were also accompanied by Kara Reynolds and Dawn Pleiman of Ohio EPA on both days and Mr. Jim Koskan of CSC on November 10, 2003. I inspected CSC-MP to determine its compliance with Ohio's hazardous waste laws as found in Chapter 3734. of the Ohio Revised Code (ORC) and Chapter 3745. of the Ohio Administrative Code (OAC). During the inspection we also discussed ways to prevent pollution by reducing waste. This letter will explain the violation I found, what you need to do to correct the violation, a general concern that I have and what you need to do to respond to my general concern.

CSC-MP produces heat processed food products including soups. The general process involves the following steps: ingredients to receiving → preparation areas (vegetables are pealed and diced) → tram system moves holding bins to kettles → filler bowls → cans closed → coded (video jet) → cookers → labeling → boxed→ warehouse. Very little hazardous waste is generated since most of the materials used in the plant must be food grade materials. Kettles are cleaned with food grade cleaners and the wastewaters go to the on-site wastewater treatment plant.

The following hazardous wastes are generated in CSC-MP:

Main Plant **OHD 005419171** / CESQG-TSD

1. Video Ink Jet Waste (F005) This waste is generated from cleaning the video ink jet machines. When the ink runs out the machine is programed for cleaning mode. The cleaner is 68% MEK (Methyl Ethyl Ketone). Approximately two 55-gallons drums of this waste is generated each year.

2. Waste Thermometers (D009) When mercury thermometers do not operate properly or are broken they are discarded.

3. Waste Paint (D001) This waste is generated from cleaning painting equipment and left over paint. The plant paints walls, stripes and rails, etc.

Printed on Recycled Paper

4. Used Oil (Non-hazardous) Used oil is generated in the main plant, water treatment plant, power plant and Maintenance Construction Area (Building N-24). It is accumulated in 55-gallon drums and stored in a curbed and fenced area outside the main plant. It is recycled by Midwest Environmental.

I found the following violation of Ohio's hazardous waste laws. In order to correct this violation you must do the following and send me the required information **within 30 days** of your receipt of this letter:

1. **Waste Evaluation**
   OAC Rule 3745-52-11

   A person who generates a waste must determine if the waste is listed as a hazardous waste in rules 3745-51-30 to 3745-51-35. CSC-MP had failed to determine that its video ink jet waste was listed as an F005 hazardous waste. CSC-MP had characterized the waste as ignitable (D001) waste only. The Make Up (cleaning) solvent contains 68% MEK and, therefore, should have been designated as an F005 waste.

   In order to correct this violation, CSC-MP must record the hazardous waste number F005 on all future manifests for the video ink jet waste from the Main Plant and submit to me either a copy of the next completed manifest, or a revised copy of a manifest, as an example, if the waste will not be shipped off-site within 30 days. CSC-MP must also submit to me a photograph documenting that the hazardous waste label is marked with the hazardous waste number F005.

During the inspection, I observed that unuseable mercury thermometers were being accumulated in one 55-gallon drum and two 5-gallon pails. A few of the thermometers were broken, but the containers were not closed. Because of the potential for exposure to mercury vapor from the broken thermometers, I strongly recommend that you keep all containers of unuseable thermometers closed, except when it is necessary to add more. Please send me a photograph of the closed container used to accumulate the unuseable mercury thermometers, **within 30 days** of your receipt of this letter.

We discussed annual training that you participate in and you indicated an interest in hazardous waste management training provided by the University of Findlay. Here is the web site for the program: http://seem.findlay.edu/ESH/default.asp.

For your information, I have enclosed a copy of the following fact sheets and lists: The Regulation of Used Oil: An Overview for Ohio Businesses - Used Oil Generators, Commercial Used Oil Marketers and Recyclers, Fluorescent Lamps Fact Sheet, Computer, Fluorescent Lamp and Ballast Recyclers and Management of Electronic Waste From Business.

As we discussed during the inspection, you may be able to reduce the waste your company generates. If you find ways to recycle, reduce or altogether eliminate the amount of waste that your company generates you may be able to reduce your treatment and disposal costs and you may possibly reduce your regulatory requirements. If you would like more information about pollution prevention, or if you would like to be considered for an in depth, on site pollution prevention assessment, please contact me at (419) 373-3074 or Ohio EPA's Office of Pollution Prevention (OPP) at (614) 644-3469.

The Division of Hazardous Waste Management has created an electronic news service to provide you with quick and timely updates on events and news related to hazardous waste activities in Ohio. If you haven't already, we encourage you to sign-up for this free service. You can find more information at the following Web link http://www.epa.state.oh.us/dhwm/listserv.html. Please feel free to share this information with your colleagues.

Enclosed you will find a copy of the checklists that I completed during the inspection of the Main Plant. Should you have any questions, please feel free to contact me at (419) 373-3074. You can find copies of the rules and other information on the division's web page at http://www.epa.state.oh.us/dhwm. Ohio EPA also has helpful information about pollution prevention at the following web address: http://www.epa.state.oh.us/opp.

Sincerely,

Don North
District Representative
Division of Hazardous Waste Management

USED OIL MANAGEMENT ACTIVITY

✓ Generator/Collection Center/Aggregation	____ Marketer
____ Transporter/Transfer Facility	____ Off-Spec Burner
____ Processor/Re-Refiner	____ Other (specify)
____ No Generation	

PROHIBITIONS

1. Is used oil being managed in a surface impoundment or waste pile? If so: — Yes___No ✓ N/A ___RMK#___

   Is the surface impoundment or waste pile being regulated under OAC 3745-54 to 3745-57 or 3745-65 to 3745-69? [3745-279-12(A)] — Yes ___ No ❑ N/A ✓ RMK#___

2. Is used oil being used as a dust suppressant? [3745-279-12(B)] — Yes ❑ No ✓ N/A ___RMK#___

3. Is off-specification used oil fuel burned for energy recovery only in devices specified in 3745-279-12(C)? — Yes ___ No ❑ N/A ✓ RMK# 1.

Campbell's no longer burns

USED OIL GENERATOR STANDARDS

4. Does the generator mix hazardous waste with used oil only as provided in 3745-279-10(B)? [2745-279-21(A)] — Yes ___ No ❑ N/A ✓ RMK#___

5. Does the generator of a used oil containing greater than 1,000 ppm total halogens manage the used oil as a hazardous waste unless the presumption is rebutted successfully? [3745-279-21(B)] — Yes ___ No ❑ N/A ✓ RMK#___

6. Does the generator only store used oil in tanks, containers, or units subject to OAC 3745-54 to 3745-57 or 3745-65 to 3745-69? [3745-279-22(A)] — Yes ✓ No ❑ N/A ___RMK# 2.

Stored in 55-gal drums

7. Are containers and aboveground tanks used to store used oil in good condition with no visible leaks? [3745-279-22(B)] — Yes ✓ No ❑ N/A ___RMK#___

8. Are containers, above ground tanks, and fill pipes used for underground tanks clearly labeled or marked "Used Oil?" [3745-279-22(C)] — Yes ✓ No ❑ N/A ___RMK#___

9. Has the generator, upon detection of a release of used oil, done the following: [3745-279-22(D)]

   a. Stopped the release? — Yes ___ No ❑ N/A ✓ RMK#___

   b. Contained the release? — Yes ___ No ❑ N/A ___RMK#___

   c. Cleaned up and properly managed the used oil and other materials? — Yes ___ No ❑ N/A ___RMK#___

   d. Repaired or replaced the containers or tanks prior to returning them to service, if necessary? — Yes ___ No ❑ N/A ___RMK#___

10. Does the generator burn used oil in used fired space heaters? [3745-279-23] If so: — Yes___No ✓ N/A ___RMK#___

Used oil stored in curbed, fenced area outside main plant.

a. Does the heater burn only used oil that owner/operator generates or used oil received from household do-it-yourself (DIY) used oil generators? — Yes ___ No ☐ N/A ✓ RMK#___

b. Is the heater designed to have a maximum capacity of not more that 0.5 million BTU per hour? — Yes ___ No ☐ N/A ___ RMK#___

c. Are the combustion gases from heater vented to the ambient air? — Yes ___ No ☐ N/A ___ RMK#___

11. Does the generator have the used oil hauled only by transporters that have obtained an EPA ID#, unless the generator qualifies for an exemption pursuant to 3745-279-24 (self transportation or tolling agreements)? [3745-279-24] — Yes ✓ No ☐ N/A ___ RMK# 4.

4. Midwest Environmental

USED OIL COLLECTION CENTERS AND AGGREGATION POINTS

12. Is the DIY used oil collection center in compliance with the generator standards in 3745-279-20 to 3745-279-24? [3745-279-30] — Yes ___ No ☐ N/A ✓ RMK#___

13. Is the non-DIY used oil collection center registered with Ohio EPA? [3745-279-31] — Yes ___ No ☐ N/A ___ RMK#___

14. Is the used oil aggregation point in compliance with the generator standards in 3745-279-20 to 3745-279-24? [3745-279-32] — Yes ___ No ☐ N/A ___ RMK#___

WASTE EVALUATION

15. Have all wastes generated at the facility been evaluated? [3745-52-11] — Yes ___ No ☑ N/A ___ RMK# 3.

SQG: Between 100 and 1,000 Kg. (about 25 to under 300 gallons) of waste in a calendar month

LQG: >1,000 Kg. (~300 gallons) of waste in a calendar month or > 1 Kg. of acutely hazardous waste in a calendar month

NOTE: *To convert from gallons to pounds: Amount in gallons x Specific Gravity x 8.345 = Amounts in pounds*

POLLUTION PREVENTION

Note to the Inspector: This checklist has been developed to help the division in gathering general information about the pollution prevention (P2) practices that the company may have initiated or attempted to initiate. The checklist is also used to:

- Facilitate P2 discussions;
- Identify barriers to P2;
- Define the P2 universe;
- Identify the need for future P2 initiatives;
- Identify partnership opportunities; and
- Link companies with better P2 resources.

As a prelude to completing this checklist the inspector should use the following list of questions as a way to initiate a dialogue concerning P2:

1. Have you tried to reduce the volume of waste (hazardous and nonhazardous) that you generate?

2. What is the largest waste stream that you generate?

3. How important would it be to you to eliminate that waste stream?

4. Does your company understand the reduced regulatory burden and cost saving benefits that eliminating or reducing a waste stream can have?

5. Could you use better housekeeping practices to reduce the amount of waste that you generate?

If the company responds with one of the answers below, the appropriate box should be checked. If the company's response does not correspond to one of the options below, please record the answer in the space provided in the remarks section.

1. Has the company undertaken any P2 activities to reduce the amount of waste generated? ☑Yes ☐No ☐N/A ___RMK#

   a. If so, what has the company done to minimize waste generation?

   - ☐ A change in the process resulting in less waste.
   - ☐ A change in the product resulting in less waste.
   - ☐ Use of fewer and less toxic hazardous raw materials.
   - ☐ Better operations/improved housekeeping.
   - ☐ On-site recycling/reuse of hazardous materials.
   - ☐ Sending waste off-site for recycling/reuse.
   - ☐ Other activities (specify):

Campbell Soup Company used to be a large quantity generator when it manufactured its own cans. However, this business was sold and is no longer done by Campbells Company is now acting as a conditionally exempt small quantity generator.

b. ***If so,*** what wastes have been addressed?

- ❑ Solvents
- ❑ Paint related wastes
- ❑ Industrial process wastes (sludges, slags, contaminated wastes waters, etc.)
- ❑ Contaminated oils/hydraulic fluids
- ❑ Off-spec chemicals
- ❑ Shop rags
- ❑ Other (specify):
- ❑ Waste water
- ❑ Solid waste (paper, plastic, metal, wood, blasting material)
- ❑ Air emissions
- ❑ Energy use
- ❑ Fluorescent light bulbs
- ❑ Used batteries

c. If they haven't minimized waste are there barriers that are preventing them from doing it?

- ❑ Lack of information about practical alternatives.
- ❑ Lack of capital to make process changes.
- ❑ Lack of internal management support.
- ❑ The company does not generate enough waste to consider P2.
- ❑ Other reason given (specify):

2. Does the company plan to do P2 activities in the future? ☒Yes ❑No ❑N/A ___RMK#
Have a recycling committee

3. Would the company be interested in receiving additional information from Ohio EPA about P2? ❑Yes ❑No ❑N/A ___RMK#
Maybe

4. Did you give the company information about P2 during the inspection? ☒Yes ❑No ❑N/A ___RMK#
See letter

5. Would the company like a P2 assessment? ❑Yes ❑No ❑N/A ___RMK#
Maybe will call back

A. If yes, provide information that makes the company a good candidate for an assessment (i.e., known specific P2 opportunities exist, the company is willing to cooperate and commit resources to the assessment, the company fully understands DHWM's P2 assessment process, etc.)

B. If no, list the reasons the facility representative gave for not wanting an assessment.

Can't recycle/reuse ink since different colors get mixed. Some inks used because change color w/ heat.

If the company would like a P2 assessment done at their facility, the inspector must give the company representative a copy of the <u>Pollution Prevention for Hazardous Waste Generators</u> document and discuss it with them.

Campbells has expanded its by-products process so that non-saleable soup + beverage (canned) is shredded, separated + made into hog food. This keeps thousands of cans of food out of the landfill and provides useful farm food.

REMARKS

Michael Manager does an audit of the plant every 6 months.

Can plant sold to Silgan: Phil Cesen, Plt. Mgr.
Carolyn Oberhouse, Envir. Coord.

Heritage picks up waste video jet ink (CFCs)
They also supply and pick up Crystal Kleen solvent in parts washers throughout plant. This is a continual reuse program.

Process:
Ingredients to receiving → preparation areas (peal in steam pealers, remote eyes on potatoes, dice) → transmoves holding bins to kettles (600/700 gallon) → filler bowls → cans closed → cans coded once filled (video jet process) → cookers (AIB rotary or hydrostatic – 4-6 hours) → labeling → boxed → warehouse.
Very little hazardous waste since most materials used must be food grade materials.

tetrahydrofuran used in one labeling step. Very flammable If discarded would be U213 (I)(T).

Campbell's water treatment plant produces ~ 10 M gallons/day
Site also has large waste water treatment plant.

Spills of chemical → call Napoleon FD and Heritage or ERS

Kettles are cleaned w/ food grade cleaners
Waste water to on-site WWTP. (Soaps: nitric, phosphoric, caustic, bleach) Fluor tubes collected, boxed → Envir. Recycling.

CONDITIONALLY EXEMPT SMALL QUANTITY GENERATOR REQUIREMENTS

WASTE EVALUATION

1. Have all wastes generated at the facility been evaluated? [3745-52-11] — Yes ___ No ☑ N/A ___ RMK# 1

GENERATOR CLASSIFICATION

2. Does the generator produce ≤100 kg. of hazardous waste per month? [conditionally exempt small quantity generator ("CESQG")] — Yes ✓ No ___ N/A ___ RMK# 2

NOTE: *If quantities of hazardous waste accumulated on-site at any one time exceed 1,000 Kg. - or the generator produces between 100 and 1,000 Kg of hazardous waste per month, it is operating as a Small Quantity Generator ("SQG"). **If so,** complete the Small Quantity Generator Requirements checklist.*

NOTE: *To convert from gallons to pounds:*

Amount in gallons x Specific Gravity x 8.345 = Amount in pounds

OFF-SITE SHIPMENT OF HAZARDOUS WASTE

3. Does the CESQG ensure delivery of hazardous waste(s) to an off-site permitted TSD? [3745-51-05(G)(3)] — Yes ✓ No ☐ N/A ___ RMK# ___

REMARKS

1. Campbell's generates a hazardous waste cleaning solvent from its video jet printing process. At the time of the inspection this was designated D001. The cleaning solvent - called Make Up is 68% MEK. Therefore, the waste must be designated F005 and all records must be revised. It has always been handled as a hazardous waste.

2. About 2 drums/year of ink waste (F005) and a very small amount of mercury from thermometers (D009). Occasionally (very) small amounts of paint waste (D001) from painting walls, stripes + nails.

From: Kara Reynolds
To: Kovacich, Michael
Date: 11/13/03 4:47PM
Subject: Re: Napoleon Risk Assessment

Michael,

I believe that a conference call is still required to discuss the statistical evaluation that CSC proposed and any other concerns that may come up before then. I will contact you with potential dates/times for that call ASAP.

Thanks,
Kara

From: "Michael Kovacich" <mkovacich@geotransinc.com>
To: <Kara.Reynolds@epa.state.oh.us>
Date: 11/13/03 12:39PM
Subject: Napoleon Risk Assessment

Kara,

Following our October 28, 2003 conference call, Campbell has provided written responses to all of the Ohio EPA's questions regarding the proposed risk assessment methods. We have sent materials via Fed Ex on 10/28/03 and via e-mail on 10/31/03 and 11/10/03. Provided below is a summary of the current proposed risk assessment methods based on recent input from the Ohio EPA.

PART 1) The closure unit is represented by the bermed area (soil that has been stockpiled above the native grade which is approximately 670 to 674 feet amsl) shown on Figure 7. The bermed area is characterized by all of the soil samples that remain on site (see the excel spreadsheet titled, "Draft Risk Assessment Entire Site.xls"). Per your 11/13/03 e-mail, the soil samples collected from PB-02-52 through PB-02-58 and MW-1 through MW-3 define the extent of the closure unit and will be added to our final risk calculation.

PART 2) The chemicals of concern (COCs) are presented in the June 27, 2003 Certification Report and Attachment A of the Notice of Deficiency.

PART 3) The risk assessment will consist of the following: The maximum concentrations of each COC, except for benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene and indeno(1,2,3-cd)pyrene (PAHs of concern), will be divided by their respective GCNs. The maximum concentrations of the four PAHs of concern will be substituted by the 95 percentile as calculated by the non-parametric Wilcoxon Signed Rank test. The Wilcoxon Signed Rank test will be performed for each of the PAHs of concern using all of the soil samples presented in PART 1 of this e-mail. Non-detect concentrations will be represented as 1/2 the laboratory reporting limit. The resulting ratios and 95 percentiles will be summed. A sum less than 1 indicates that the site will not pose an unacceptable risk to human health under residential exposure assumptions and that the site will be closed with no restrictions.

Campbell will provide any additional information requested by the Ohio EPA to help facilitate a decision regarding the proposed risk assessment methods.

We would appreciate approval or additional comments from the Ohio EPA regarding the proposed risk assesment methods, so we can complete the RCRA Closure Certification Report. If you feel a conference call is still needed please let us know.

Sincerely,

Michael Kovacich, CPG

From: Kara Reynolds
To: mkovacich@geotransinc.com; thumphriss@geotransinc.com
Date: 11/12/03 9:54AM
Subject: Raw Data

Michael,

Thank you, I was able to locate the document *Limited Subsurface Investigation, Former Holding Pit Area*.

I read over the e-mail that you sent to Erik. As far as the last comment concerning the berm area, the samples PB 02-52 through PB 02-58 and MW-1 through MW-3 should be included in the risk assessment. The CPRG requires the delineation of contamination from the unit to be completely defined. This requires a facility to find a boundary consisting of two consecutive sample points (both vertically and horizontally) with ND results for all COCs. The outermost sampling points (PB 02-52-PB 02-58, MW-1-MW-3) still have detections of COCs, which would require CSC to delineate the contamination outside of these points. However, OEPA has agreed to let these sampling points be considered the boundaries of the unit. Therefore, these samples shall be included in the risk assessment.

Please let me know if you have questions regarding this.

Thank you,

Kara Reynolds

To: <erik.hagen@epa.state.oh.us>
Date: 11/10/03 7:25PM
Subject: Fwd: Napoleon Preliminary Risk Assessment Calculations

Erik,

You should have received a Fed Ex package from GeoTrans on October 29th or 30th. The figures included in the transmittal are current. However, a revised risk assessment spreadsheet was sent to the Ohio EPA, via e-mail, on October 31, 2003 (please see below). Please disregard the tables (Subset 1 and Subset 2) included in the Fed Ex package and review the October 31, 2003 e-mail and attachments.

The attached draft risk assessment spreadsheet includes all of the data used in our recent calculations. There are some data quality issues (minor data entry errors) with this sheet, we are currently reviewing the data and plan to issue a revised spreadsheet later this week. The data entry errors do not effect the calculations since the max concentrations were used for those parameters.

With regards to your recent question regarding the distribution of the four PAHs of concern, this spreadsheet will not address that question since 1/2 the detection limit is posted. The intent of the spreadsheet is to present values used to determine the 95 th percentiles for the four PAHs. You could look at the distribution of naphthalene to get an idea of the general distribution of the remaining SVOCs.

Please note: Investigative borings (PB-1 through PB-22 and PB-01-23 through PB-01-51) in the bermed area at this site identified several VOCs and SVOCs (chemicals of concern). All soil that was above a GCN was remediated, either by thermal treatment or off site disposal. The thermal plant effectively destroyed all VOCs, and reduced the SVOC concentrations. For example: Sample PB-01-34 from 8-9 feet below grade (approximately 679.5 feet amsl) exhibited the following concentrations of three PAHs: benzo(a)anthracene @ 16,000 ug/L, benzo(a)pyrene @ 14,000 ug/L, and benzo(b)fluoranthene @ 14,000 ug/L. Whereas our treated soil stockpile samples (VR samples) reported concentrations in the 500 ppb to 2000 ppb range for these COCs. A preliminary risk assessment was performed in Spring 2003 to determine if treated soil stockpiles could be returned to the excavation. The results from the preliminary risk assessment indicated that if three stockpiles with the highest PAH concentrations were disposed off site the remaining treated soil could be combined with the overburden soils and placed back into the excavation. Please see our Draft October 21, 2003 letter to Kara Reynolds for additional site history information.

I have responded to your specific questions below. I am out of the office until Thursday. Please contact Tesha Humphriss at (734) 213-4068 with any questions in my absence. I understand that you will be traveling this week and will not be able to attend a conference call until Friday, 11/14/03. I will check with Kara and Campbells to see if we can set up a conference call for Friday afternoon.

Sincerely,

Michael Kovacich, CPG
Senior Hydrogeologist

phone: 734.213.5024
fax:734.213.5008

>>> "Kara Reynolds" <Kara.Reynolds@epa.state.oh.us> 11/10/03 07:51AM >>>
Michael,

Here are some of the questions that I have gotten from Central Office. These are questions that we would like to be answered prior to a conference call.

1. The statistical evaluation that was sent to me had little detail. I'd like to see the dataset that was used and have an explanation of equations used to assign confidence intervals.

Please refer to the October 31, 2003, e-mail below. The data set that was used in the statistical software (Minitab) for the four PAHs is shown in the attached spreadsheet. If the PAH was not detected, 1/2 the detection limit is posted and was used for the statistical evaluation of the 4 PAHs. In general, an actual detection is greater than 330 ppb, and 1/2 the detection limit is less than 250 ppb.

2. Since I'm not as close to the project as most involved, I'd like to know what is the difference between subset 1 and subset 2. I did read the footnotes provide in the tables. It seems from these notes that these are the two subsets for risk that the facility had proposed. Is this true?

As described above, please disregard the tables sent to you via fed-ex that present Subset 1 and Subset 2. It is our understanding that the Ohio EPA and Campbell have agreed that one population will be used to represent the closure unit. The closure unit is the bermed area and all of the samples presented in the attached spreadsheet will be used to represent this population. Subset 1 and Subset 2 were combined to make this spreadsheet.

3. PAHs were detected in two side wall samples. At what depth were these samples taken?

In general, sidewall samples were taken between 2-feet and 5-feet below surface grade.

4. Did side wall samples contain PAH compounds that were not originally included by the facility in their risk assessment?

No, all parameters detected in the sidewall samples were identified during the initial site investigation, and were included in the risk assessment proposed in the Closure Plan.

5. Are the side wall samples included in the berm area?

Yes, please see explanation below.

A big question that seems to come up quite a lot is the "berm" area; which samples are you including in the "berm" area, etc.

Currently, the closure unit is defined as the bermed area (soil that has been stockpiled above the native grade which is approximately 670 to 674 feet amsl). Please refer to Figures 6 and 7 sent to you via fed ex. PB-02-52 through PB-02-58 and MW-1 through MW-3 were installed outside of the limits of the bermed area, and are not included in the risk assessment. The bermed area includes all samples that remain on-site within the limits defined by PB-02-52 through PB-02-58 and MW-1 through MW-3.

Please let me know if you have any questions.

Thanks,
Kara

We have evaluated the One Sample Test For Proportion as it is presented in the EPA document: Guidance for Data Quality Assessment: Practical Methods for Data Analysis. EPA QA/G-P QA97 Version. The test is mathematically the same as a Sign Confidence Interval Test.

The Sign Confidence Interval Test can be easily calculated using Minitab Release 13 for Windows (Minitab). We have completed the calculation for benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene and indeno(1,2,3-cd)pyrene (the four PAHs). In the calculation we used 119 samples that currently represent the entire closure unit (remaining investigative samples, excavation floor and sidewalls, and the cover and treated soil backfill). Non detectable concentrations were included in the calculation at one half the reported detection limit. Please note, there are 141 samples representing the closure unit (the elevated area). However, only 119 of these samples were analyzed for SVOCs, and therefore only 119 were included in the Minitab calculation.

The EPA Guidance for Data Quality Assessment indicates that the Wilcoxon Rank Sum is the preferred method. We have included the results from that test using the same input listed above. The output from Minitab for both tests is attached. We have also attached our recent DRAFT risk assessment calculation. The spreadsheet combines the data in the two subsets sent previously and our recent calculation. Blank spaces represent either non-dectected parameters or parameters that were not tested. This will be resolved in the final spreadsheet. The calculation includes max concentrations for all compounds detected in samples that remain on site except the four PAHs where the 95 percentile as calculated by the Wilcoxon Rank Sum Test has been substituted.

Please review these attachments in preparation for our second conference next week. I am available on Friday possibly Thursday. If you should have any questions please give Tesha Humphriss a call in my absence at 734.213.4068.

Subject: Questions

Michael,

Here are some of the questions that I have gotten from Central Office. These are questions that we would like to be answered prior to a conference call.

1. The statistical evaluation that was sent to me had little detail. I'd like to see the dataset that was used and have an explanation of equations used to assign confidence intervals.

2. Since I'm not as close to the project as most involved, I'd like to know what is the difference between subset 1 and subset 2. I did read the footnotes provide in the tables. It seems from these notes that these are the two subsets for risk that the facility had proposed. Is this true?

3. PAHs were detected in two side wall samples. At what depth were these samples taken?

4. Did side wall samples contain PAH compounds that were not originally included by the facility in their risk assessment?

5. Are the side wall samples included in the berm area?

A big question that seems to come up quite a lot is the "berm" area; which samples are you including in the "berm" area, etc.

Please let me know if you have any questions.

Thanks,
Kara

Subject: Re: Draft Spreadsheet

Kara,

I have provided answers to your questions below.

Mike
>>> "Kara Reynolds" <Kara.Reynolds@epa.state.oh.us> 11/07/03 09:24AM
>>>
Michael,

I looked over the raw data in the closure plan and found some errors in the draft risk spreadsheet. I have attached a list of the errors that need to be changed in the spreadsheet. I also could not find the results for the following samples in the closure plan. Will you please send the following raw data sheets to me? We need to have a complete set for the closure plan.

We are performing a validation check on the data presented in the draft risk spreadsheet. Most of the errors that you listed have been identified during our recent check. I plan to have the updated risk spreadsheet to you by early next week.

All of the raw data from the samples analyzed from PB-1 through PB-22 for the depths listed below, were presented in our February 16, 2000, report titled, Limit Subsurface Investigation, Former Holding Pit Area. The analytical work was performed by BEC Laboratories in Toledo, Ohio and did not include analysis for SVOC. The presence of naphthalene in some of these samples prompted the inclusion of a full SVOC scan in subsequent investigations. Please let me know if you do not have that report and need copies of the raw analytical data sent to you. Is regular mail ok?

For VOCs:
PB 01 through PB 01-21 for the depth of 9.5-10 February 16, 2000, report
PB 15 (6-7) February 16, 2000, report
PB 20 (6-7) February 16, 2000, report
PB 01-21 (8-9) February 16, 2000, report
PB 01-22 (7-8) February 16, 2000, report
PB 01-48 (5-6) (11-12) (15-16) Presented in Appendix A of the Closure Plan on pages 121,122 & 123 of the New Age/Landmark Laboratory Analytical Report

For SVOCs:
PB 01 through PB 01-21 for the depth of 9.5-10 Not Analyzed
PB 01 (15-16) Not Analyzed
PB 15 (6-7) Not Analyzed
PB 20 (6-7) Not Analyzed
PB 21 (8-9) Not Analyzed
PB 22 (7-8) Not Analyzed
PB 47 (15-16) Not Analyzed

Please let me know if you have any questions.
Thank you,
Kara

Subject: Campbell's

Kara,

I've looked at the diagrams and tables that GeoTrans sent to us. My review has not been very detailed because of some time constraints that I didn't know about last week.

I do need some clarification on some points.

1. The statistical evaluation that was sent to me had little detail. I'd like to see the dataset that was used and have an explaination of equations used to assign confidence intervals.

2. Since I'm not as close to the project as most involved, I'd like to know what is the difference between subset 1 and subset 2. I did read the footnotes provide in the tables. It seems from these notes that these are the two subsets for risk that the facility had proposed. Is this true?

3. PAHs were detected in two side wall samples. At what depth were these samples taken?

4. Did side wall samples contain PAH compounds that were not originally included by the facility in their risk assessment?

5. Are the side wall samples included in the berm area?

6. I did not see the draft risk assessment, did the results indicate a benefit of further removal of material along the side wall? In other words would further removal of insitu materials and a limited resampling of remediation cause us to change our perspective on the risk assessment.

I'll look into this data set further and probably have more questions for you.

Give me a call if you'd like to discuss any of the questions.

Regards,
Erik

Subject: Maximum Concentrations at the Campbell Napoleon Site

Kara,
In follow-up to our phone conversation yesterday. You were asking why the maximum concentration shown in Table 11 of the Certification Report was higher, for some parameters, than the maximum concentration shown in DRAFT Table (Risk Assessment Entire Site) sent to you via e-mail last Friday.

I have pulled up the electronic file from which Table 11 in the Certification Report was generated from. Unfortunately, there is a mistake in Table 11 (Estimates of Residual Risk) as presented in the Certification Report. The maximum concentration for each parameter was taken from a spreadsheet which included all 'post closure samples' (FL, SW, VR, CS and IS). The maximum concentration shown in Table 11 includes sample locations VR-03-04, VR-03-05 and VR-03-07. These samples were disposed of off site, and should not be included in the maximum concentration. Therefore, the maximum concentration for the following PNA's in the 'post closure samples' (minus VR-03-04, VR-03-05 and VR-03-07) should be changed in Table 11 as follows:

Anthracene (1300 ppb to 380 ppb)
Benzo (g,h,i) perylene (2500 to 850)
Carbozle (810 to 0)
Dibenzofuran (560 to 0)
Fluoranthene (9100 to 3400)
Fluorene (380 to 0)
Phenanthrene (6500 to 2500)
Pyrene (8000 to 2100)

In addition, the 'post closure samples' that were used to generate the maximum concentration for Table 11 included IS-02-02. This sampled failed the QA/QC for volatiles, and was re-sampled. By eliminating IS-02-02 and including IS-02-02 (2) in the 'post closure sample' set, the following maximum concentrations in Table 11 for VOCs should be changed as follows:

Ethlybenzene (1680 ppb to 270 ppb)
Toluene (35 to 20)
Total Xylenes (13020 to 920)

We are currently completing a check against the lab reports for all samples presented in the DRAFT Table (Risk Assessment Entire Site). We will have the quality check completed by Friday. Will the Ohio EPA be ready for a follow-up conference call on Friday?

Call me at the number below with any questions or concerns.
Thanks,
Tesha

Subject: Napoleon Preliminary Risk Assessment Calculations

We have evaluated the One Sample Test For Proportion as it is presented in the EPA document: Guidance for Data Quality Assessment: Practical Methods for Data Analysis. EPA QA/G-P QA97 Version. The test is mathematically the same as a Sign Confidence Interval Test.

The Sign Confidence Interval Test can be easily calculated using Minitab Release 13 for Windows (Minitab). We have completed the calculation for benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene and indeno(1,2,3-cd)pyrene (the four PAHs). In the calculation we used 119 samples that currently represent the entire closure unit (remaining investigative samples, excavation floor and sidewalls, and the cover and treated soil backfill). Non detectable concentrations were included in the calculation at one half the reported detection limit. Please note, there are 141 samples representing the closure unit (the elevated area). However, only 119 of these samples were analyzed for SVOCs, and therefore only 119 were included in the Minitab calculation.

The EPA Guidance for Data Quality Assessment indicates that the Wilcoxon Rank Sum is the preferred method. We have included the results from that test using the same input listed above. The output from Minitab for both tests is attached. We have also attached our recent DRAFT risk assessment calculation. The spreadsheet combines the data in the two subsets sent previously and our recent calculation. Blank spaces represent either non-dectected parameters or parameters that were not tested. This will be resolved in the final spreadsheet. The calculation includes max concentrations for all compounds detected in samples that remain on site except the four PAHs where the 95 percentile as calculated by the Wilcoxon Rank Sum Test has been substituted.

Please review these attachments in preparation for our second conference next week. I am available on Friday possibly Thursday. If you should have any questions please give Tesha Humphriss a call in my absence at 734.213.4068.

Subject: Re: Questions

Kara,

I have provided answers to your questions below. Please give me call if you would like additional clarification.

Sincerely,
Mike

>>> "Kara Reynolds" <Kara.Reynolds@epa.state.oh.us> 10/30/03 02:11PM >>>
Michael,

I have a few questions concerning the information that you sent to us.

1. Is it correct to assume that PB-01 and PB-1; PB-02 and PB-2; PB-03 and PB-3; etc. are the same thing? They are labeled as one on the figure and the table lists them as the other.

Yes, your assumption is correct.

PB-1 through PB-22 were installed in 1999. PB-1 through PB-9 are presented on Figure 6 as PB-01 through PB-09 and represent the same sample locations. PB-01 and PB-15 were resampled in 2001. I think we will drop the extra "0" for the final figure.

2. After looking over the closure plan and certification, the following samples are not listed on the Fate of Sample table. I was wondering if you could give me the information concerning these samples as well.

Some borings were terminated and samples were not submitted for laboratory analysis when PID readings were detected. During that phase of the project we were trying to find the extent of the contamination. This was the case for PB-01-26, 30 and 33. PB-01-51 was held for analysis in case PB-01-48 was contaminated. PB-01-48 was not contaminated and therefore, PB-01-51 was not needed. Below is specific information regarding each sample:

PB-01-26 Was never submitted for analysis.
PB-01-30 Was never submitted for analysis.
PB-01-33 Was never submitted for analysis.
PB-01-33 (11'-16') Represents a water sample, results are presented in the Closure Plan.
PB-01-34 (11.5'-16.5') Represents a water sample, results are presented in the Closure Plan.
PB-01-35 (11'-16') Represents a water sample, results are presented in the Closure Plan.
PB-01-45 (11'-16') Represents a water sample, results are presented in the Closure Plan.

PB-01-46 (11'-16') Represents a water sample, results are presented in the Closure Plan.
PB-01-51 Was never submitted for analysis.
PB-02-28 PB-01-28 was resampled in 2002 for waste characterization in accordance with Section 14.4 of the closure plan. Hand auger refusal during the May 2002 waste characterization sampling event led to the collection of PB-02-28 with a Geoprobe during the soil and groundwater investigation in late summer 2002.

Thank You,
Kara

Re: Campbell Soup Napoleon RCRA Closure

We are enclosing: Tables and Figures

Remarks:

Kara,

Please find enclosed the revised Figure 6 and an additional Figure 7. Figure 6 includes the final excavation and the location of the samples collected at the site. Per your request Figure 7 presents the pre-excavation topography of the site. Also, enclosed please find two tables: one that presents the fate of every sample collected at the site, and a second that presents the two subsets recently described in our draft October 21, 2003 letter and our October 28, 2003 conference call. Please note, when combined the two subsets represent all of the samples that remain on the site.

Please do not hesitate to give me a call at 734.213.5024 should you have any questions regarding the content of this packet.

Subject: Michael,

Michael,

Here's the information for the GCN values.

All values will be found on the GCN table that was included in the Certification Report NOD.

For 2-hexanone use the GCN values for methyl isobutyl ketone (MIBK).

For acenaphthylene use the GCN vales for acenaphthene.

For chlorodibromomethane use the GCN values for dibromochloromethane.

Please let me know if you have any other questions.

Thanks,
Kara

Subject: Fwd: Re: structures

Kara, We are good to go on using the MIBK values for 2-hexanone. So now we've got all 3 covered I guess. Good luck with them this afternoon!
Jeff

>>> Stephanie Beak 10/28/03 10:59AM >>>
Jeff,

I think that does make sense. It may not be toxicologically exact, but a good conservative approximation (and a viable option for assessing the risk quantitatively). Thanks for your work on this.

Stephanie

>>> Jeff Reynolds 10/28/03 10:21AM >>>
Stephanie, I did some further checking into 2-hexanone as you suggested. It was not in TERA's database or Region IX's (I had checked this one before and didn't remember until I saw the table). So I looked into the structures of other ketones to try to assess which was the closest to 2-hexanone. Out of the ones we have values for MIBK may well be the most similar. It has the same formula with a branched structure (methyl group) instead of a straight chain. MEK and acetone are 2-3 carbons smaller even though they are straight chains.

MIBK is also the one with the lowest RfDo values. MEK is 6.0E-01, acetone is 1.0E-01, and MIBK is 8.0E-02. It seems like using this value as a surrogate would at least be a reasonable one to propose to Campbell's. If they come up with something better in response, we can evaluate that. But at least it's not qualitative. Let me know if you think it makes sense to recommend this approach to Kara.

Thanks!

Subject: 2 down, 1 to go

Kara,
I talked to Stephanie and due to the very similar structures (and the precedent of others using them) of acenaphthene and acenaphthylene we should be okay to use that pair for surrogate compounds (and the GCN values will serve for both).

I'm going to do some more looking on 2-hexanone and will have to get back with you on that one. I'm going to look on a couple more web pages, compare chemical structures, etc. It's good to know they at least looked at it qualitatively but still tough to mix that in with all the quantitative numbers.

And since chlorodibromomethane is just another name for dibromochloromethane, we are all set with the GCN value there.

I'll get back with you soon! Jeff

>>> Kara Reynolds 10/27/03 12:52PM >>>
Jeff,

I told Stephanie that for the original draft for the certification, CSC used a qualitative assessment of some sort on the 2-hexanone. I didn't look into it very well, I just figured that they didn't know the GCN to use and did it that way, but maybe Mylynda already oked it.

As for the other two chemicals, did the surrogates still need to be oked by Stephanie, or did she already ok them? I was a little confused.

Let me know when you get a chance,

Kara

Date: 10/23/03 3:57PM
Subject: soup pits

Kara,

Chlorodibromomethane is a synonym of dibromochloromethane (CAS#124-48-1) - see the below ATSDR site for more info
there is also a synonyms tab on the GCN spreadsheet but it's a little hard to line up the numbers from tab to tab sometimes
http://www.atsdr.cdc.gov/toxprofiles/tp130.html#4
or look at the iris page under dibromochloromethane
http://www.epa.gov/iris/subst/0213.htm
Anyway, the GCN values for the synonym compound can be used.

I think we have used Acenapthene (CAS#83-32-9) as a risk surrogate compound for **acenaphthylene** (CAS#208-96-8)
Acenapthene (C12H10) and acenaphthylene (C12H8) are very similar, just a double bond different, if you care, you can check it out at:
http://webbook.nist.gov/chemistry/cas-ser.html
I was looking to find a source for the use of the surrogate part. I found an old memo (1997) from the "Environmental Assessment Unit" saying that was the one to use? Then I found a paper from Alaska that referred to the NCEA saying that was the surrogate to use (as a footnote to a table in the attached file). But then Florida (see below) uses pyrene Which has 3 benzene rings instead of 2 plus a five carbon ring.

2-hexanone (CAS #591-78-6) has some information on the ATSDR page as well
http://www.atsdr.cdc.gov/toxprofiles/tp44.html
This one isn't on IRIS, so we need to look elsewhere. Erik had a Florida document (also attached - from the University of Florida) that makes reference to an NCEA value for an RfDo for 2-hexanone and then extrapolated the other two values (RfDi and RfDd) from that. The same table used pyrene as a surrogate for acenaphthylene and so gave a value half as big as acenaphthene's.

BUT THEN, I called NCEA and they said the two old papers for 2-hexanone had been withdrawn and they were waiting on two new ones (Rfc and Rfd) and that they would send those when they were finished. Since they are still awaiting internal review and external review that sounds like it will be a while to me. I'll have to check with Stephanie on what to do about not having current values for 2-hexanone (and not having a direct source for the out of date values). I'll also check with her to confirm our preferred surrogate (or other approach) for acenaphthylene. I'll get back with you soon!

Jeff

Subject: Napoleon Revised Risk Assessment Methods

Kara,

We have completed our review of the Ohio EPA's, October 14, 2003 email regarding our proposed risk assessment methods for the Former Holding Pit Unit RCRA Closure. We have revised the risk assessment methods to address the Ohio EPA comments listed in the October 14, 2003 email. Please review the attached draft letter that summarizes the development of the risk assessment methods used at the site and our proposed revisions.

Following your review please give me a call to discuss the revised methods. I can arrange a conference call with our toxicologist if you have any specific questions for her.

Sincerely,

Michael Kovacich, CPG

Re: Revised Risk Assessment Methods
RCRA Site Closure Certification Report Former Holding Pit Unit
Campbell Soup Supply Company, Napoleon, Ohio

Dear Ms. Reynolds:

GeoTrans, Inc. has evaluated all of the Ohio EPA comments regarding our proposed methods for performing a risk assessment for the RCRA closure at the Former Holding Pit, Campbell Soup Supply Company (Campbell) Napoleon, Ohio. GeoTrans has revised the risk assessment methods to address the Ohio EPA concerns. Prior to discussing our recently revised methods we have provided a short summary of our previous work and key Ohio EPA comments.

BACKGROUND

In January 2003, representatives of Campbell and the Ohio EPA worked together to develop a revised closure strategy that would meet Ohio EPA' s closure requirements for unrestricted use at the site. A revised closure strategy was needed, because previously unknown construction demolition debris including concrete, steel reinforcing bars, nails, wood, roofing felt, asphalt and isolated pockets of asphalt tar, was encountered in the excavation. This demolition debris is believed to be the source of elevated PAHs, specifically benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene and indeno (1,2,3-cd) pyrene, reported in the treated soil stockpiles. These elevated PAHs in the treated soil stockpile required a change in the closure strategy. Immediately following the identification of elevated PAHs in the treated soil stockpiles, Campbell began working with the Ohio EPA to revise the closure strategy. Campbell and the Ohio EPA agreed on two revisions to the closure strategy. First, soil that could not be treated, due to the presence of demolition debris, would be disposed offsite at a licensed landfill. Second, a risk assessment would be performed on all of the samples that represented the final closure unit, which consisted of the limit of the excavation, as defined by the closure plan, and the proposed backfill of overburden and treated soil. The specific samples that were used to represent the closure unit were collected from the overburden stockpiles (CS-02-01 through CS-02-17 and IS-02-01 through IS-02-03), the excavation sidewalls and floor (SW and FL samples), and the treated soil stockpiles (VR-02-01 through VR-03-14).

GeoTrans submitted a letter documenting the following risk assessment to the Ohio EPA on January 17, 2003. The maximum concentration of each detected chemical of concern (COC) was determined for the post closure samples, as defined above. The maximum concentration was then divided by its respective generic clean-up number (GCN) and the resulting ratios were summed. Exceptions from the use of the maximum concentration were granted for eight COCs. In place of the maximum concentration, the 95% upper confidence limit based on a student's "t" test (UCL) was substituted for the maximum concentration. Non-detected concentrations of the COCs were added to the data set at one half of the detection limits.

Each treated soil stockpile was tested in accordance with the approved closure plan. Per the closure plan, the treated soil was to be placed in the excavation following treatment. However, elevated concentrations of PAHs required the use of a risk assessment to determine which treated piles could be placed in the excavation and which piles would be disposed off site. Treated soil stockpiles with the highest concentrations of PAHs were removed from the site for offsite disposal and therefore were eliminated from the risk calculation. This process was repeated until the collective risk posed by the remaining treated soil and the rest of the closure unit met the requirements for unrestricted closure (the sum of ratios (UCL/GCN) less than 1). A spreadsheet documenting this calculation was submitted via –email to Mr. James Moseley and Ms. Mylinda Shaska of the Ohio EPA for comment. Mr. Moseley explained that he would defer to Ms. Shaska regarding the approval of this approach. Following Ms. Shaska's review of the spreadsheet, Ms. Shaska provided a verbal approval for this approach to Tesha Yielding on March 31, 2003.

CLOSURE PLAN IMPLEMENTATION

The project proceeded and approximately 1,200 tons of treated soil with the highest concentration of PAHs was transported for offsite disposal at the Henry County Landfill. The remaining treated soil stockpiles were combined with the overburden soils and returned to the excavation. On July 3, 2003, the Certification Report was submitted to the Ohio EPA. Upon review of the risk assessment presented in the certification report, the Ohio EPA requested that all of the samples and all of the COC data observed at every sample location of the bermed area be included in the risk assessment (Comment #32, Attachment A, Notice of Deficiency, September 4, 2003). This request effectively expanded the closure unit from the limits of the excavation to the entire bermed area. During our September 29, 2003 meeting with the Ohio EPA, Campbell agreed with the expansion of the closure unit and that all of the available data from the bermed area would be included in the revised risk assessment.

An analysis was conducted of the data from the investigation borings to determine which samples remained on site following the remediation. Once the fate of each sample was determined, all of the samples that represented soil that currently occupies the bermed area were included in a revised risk assessment. Prior to the use of the student's t test to calculate the UCL for the eight COCs, the Ohio EPA requested (Comment # 30) that the distribution of the data be determined for each parameter's data set. The Ohio EPA was concerned that the appropriate method was used to determine the UCLs. When all of the available data was combined, including one half the detection limit for the non-detectable samples, the distributions for the four PAHs were neither normally nor log-normally distributed. However, when the non-detectable samples were eliminated from the data set, the remaining samples were log-normally distributed. In an e-mail dated October 1, 2003, GeoTrans proposed to determine the distribution of the data from the detectable concentrations only. Following this determination, both the non-detect and the detectable samples would be included in the risk assessment data set and the UCLs would be determined.

On October 14, 2003, the Ohio EPA, indicated by e-mail that the use of samples with non-detectable concentrations would not be appropriate in the determination of the UCL. The Ohio EPA's reason for the exclusion of the non-detectable concentrations from the UCL determination was that the non-detectable samples represent a separate population from the treated soil. The Ohio EPA also stated that if the data was not normally or log normally distributed, non-parametric methods to determine the 90 percentile would be appropriate.

REVISED RISK ASSESSMENT

Upon review of the Ohio EPA's October 14, 2003 comments, Campbell proposes the following methods and assumptions to complete the risk assessment. During the September 29, 2003 meeting,

the Ohio EPA and Campbell agreed that the entire bermed area represents the closure unit and that all of the data that currently represents the bermed area would be included in the risk assessment. Thus, the data from the bermed area represents a single population. Based on the Ohio EPAs October 14, 2003 comments, Campbell proposes that this single population could be divided into the following two subsets:

- Soil that has never been excavated or treated. This subset would be characterized by the investigation samples that remain on the site following remediation, and all samples collected from the excavation sidewalls and floor.

- The excavation backfill. This subset would be characterized by the samples collected from the overburden stockpiles (CS-02-01 through CS-02-17, IS-03-01, IS-03-02 and IS-03-03) and the remaining treated soils (VR-02-01 through VR-02-03, VR-03-06, and VR-03-08 through VR-03-14)) that were combined with the overburden soils and used as backfill in the excavation. Since non-detectable and detectable concentrations of the PAHs were identified in both treated and overburden backfill, this subset is valid.

Separate risk assessment will be completed for each subset of samples. Per the EPA Risk Assessment Guidance for Superfund, Volume 1, Human Health Evaluation Manual (Part A), all validated samples "including non-detectable" concentrations should be used to determine the exposure concentrations. The data representing excavation backfill does not fit a normal or log-normal distribution and therefore must be evaluated using nonparametric techniques. In general, nonparametric techniques rely on ranking the data to determine percentiles. Non-detect data points are typically used in nonparametric calculations. (Source: Ohio EPA Technical Decision Compendium BA30007.03.016). Campbell proposes the Wilcoxon Signed Rank Test of the median to calculate the confidence interval and the 90th percentile upper concentration limit requested in the Ohio EPA email (October 14, 2003). This analysis will be applied to the following COCs in the backfill: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, indeno (1,2,3-cd) pyrene, and chloroform.

We look forward to discussing your comments regarding these methods.

Sincerely,

Michael S. Kovacich, CPG

Subject: Statistical Evaluation

Michael,

I just left a voice mail on your phone, but I decided to e-mail you the majority of the information.

On October 1, 2003, you e-mailed me the following question:

"2) Statistical Evaluation
We wanted to verify with you the following process. We plan to complete a statistical evaluation (i.e. determining if the data is normally distributed) for all parameters in which an UCL, instead of a maximum concentration, is used in the risk assessment. Normal or log-normal distribution will be determined from only the samples with detections (for example, ~120 samples are now being used in the risk assessment. For benzo(a)pyrene there were 15 detections above the MDL out of the ~120 samples. We determined the 15 samples with detections were log- normally distributed.) After determination of normal or log-normal distribution we will reintroduce the non-detect values at ½ the MDL and run the appropriate UCL calculation. We plan to the use the statistical software available on the Michigan Department of Environmental Quality's web page, which can be found at http://www.michigan.gov/deq/0,1607,7-135-3311_4109_9846---,00.html , bottom of the page under Part 201 StatSoft. This software will be used to determine normal or log-normal distribution and to calculate the UCL. Is this process acceptable to the Ohio EPA?"

After reviewing the data, it has been determined that this process deals with combining two different populations; the first is the data set of remediated soil and the second is the data set of soil that has not been remediated. Since there are two different populations, they should not be combined for one part of the statistical test and separated for the other.

Normally, in a situation like this (where there is a very large percentage of non-detects (ND)), our guidance would call for the maximum concentration to be used for all constituents of concern (COCs) in the risk assessment (RA). However, we are deviating from our guidance and giving you the following option. If you do not pass risk when using the maximum concentration for all COCs, then the following may be used.

All COCs that have less than 10 detections must use a maximum concentration in the RA. For the COCs that Campbell Soup Company (CSC) was going to use a 95% Upper Confidence Limit (UCL) in the RA (and have 10 or more detections), first find the distribution of the data using only the detected data (do not use the NDs). If the data is normally distributed or log-normally distributed, then proceed to find the 95% UCL of the detected data only (do not use the NDs). This will be used in the RA. If the data is not normally or log-normally distributed, then a non-parametric test will be used to find the 90th percentile. This 90th percentile will be used in the RA.

Ohio EPA does not have a problem with CSC using the above website to calculate the 95% UCL and to determine the distribution of the data.

Please note that Comment 4 of the Revised Closure Plan Approval Letter, dated August 1, 2002, states that "If Campbell is not able to demonstrate clean closure of the contaminated area at the time of submission of the certification report, Campbell shall either excavate and dispose of all contaminated material off-site or submit an amended closure plan which details the measures necessary to close as a surface impoundment in accordance with OAC rule 3745-67-28. Should the latter alternative be chosen, Campbell shall submit a closure/post-closure care plan pursuant to OAC rules 3745-66-10 through 3745-66-20 and 3745-68-10."

If you have any questions, please contact me at 419-373-3065.

Memorandum

To: Kara Reynolds, DHWM, NWDO

From: Erik Hagen, CO, ERAS

Subject: Statistical Procedure Proposed by Campbell Soup, Napoleon Site.

Date: October 9, 2003

Campbell's Soup of Napoleon, OH. is evaluating the risk posed by contamination left in soil after remediation efforts at the facility. This risk assessment is dependent upon adequately determining an exposure point concentration. Normally, an exposure concentration is based either on an upper 95% confidence interval (95% UCL) of the mean of data measurements or the maximum value from the data set is used. The logic of how to set an exposure point concentration is dependent on the number of samples, the number of non-detected values, and the underlying data distribution. The data set present by Campbell's consultants is highly skewed and biased toward the detection limit (approximately 90% non-detected data). For exposure concentration determinations with data of these characteristics, DHWM advises that nonparametric tests or a maximum value of detected be used (Closure Plan Review Guidance, 1999) in setting the input values for the exposure point concentration.

Consultants for the facility have proposed to determine exposure input values by completing a statistical evaluation (i.e. determining if the data is normally distributed) for all parameters, instead of using a maximum concentration, in the risk assessment. Either a normal or log-normal distribution will be determined only from the samples with detections. After determination of either a normal or log-normal distribution, the consultant proposes to re-introduce the non-detect values at ½ the MDL and run the appropriate UCL calculation. Furthermore, the consultants plan to the use the statistical software available from the Michigan Department of Environmental Quality.

I view this approach as technically unsound. Since active remediation has already taken place, the isolated detections of constituents of concern indicate areas of inadequate remediation analogous to hot spots. Therefore, combining non-detected data with detected data constitutes mixing two populations together and is statistically invalid. In addition, the issues associated with performing statistical procedures on highly censored data (>50%) render the proposed procedure of calculating the 95% UCL as invalid. Therefore, It is inconsequential whether the non-detected data is combined before or after a determination of detected populations distribution is made. The end result is a significant bias toward half the detection limit value. For this reason DHWM has stated in guidance that the maximum detected value is reasonable maximum exposure concentration and should be used to determine the exposure point concentration.

I would propose the following options for the facility to follow.

1. Calculate risk using the maximum detected value. If the calculate risk is above the

risk goals for the project, the facility and Ohio EPA can determine whether a risk management option is available. For example, if concentration of chemicals of concern are below grade where direct contact standards can be met, and where leaching to ground water is not a concern, then a deed restriction can be applied and closure can proceed.

2. Calculate a non-parametric estimate (such as the 90^{th} percentile of the data set) to use as in an exposure point concentration.

3. The exposure point calculation can be made by assessment the distribution of the detected values for each compound and then determining an appropriate (normal or lognormal) 95%UCL.

Subject: Questions for Certification

Mike,

To answer one of your questions:

I do not need the QA/QC packages for the September 2002 soil sampling event.

I would rather have a Level IV package than the Level III package. Also, comment 23 lists things (such as but not limited to holding times, preservation and cooler receipt, etc.) that are not listed under any of the levels of QA/QC packages on the attachment that you sent. I don't know for sure if these are included in the lab packages, but I will need this information, too.

Please send the raw data along with the other QA/QC reports. I would rather the information be on disks. It is easier to handle that way.

I hope that answers your questions. If not, please let me know. As for the statistical evaluation, our statistician has not completed his review of the proposed procedure. As soon as I get any information, I will let you know. And sorry Tesha, I still have not heard anything about the GCN numbers.

Well, if you have any other questions, please let me know.

Thanks,

Kara Reynolds

Subject: Re: Stats question

Kara,

I've read MDEQ's sampling and stat document before, but I've never used their stats program for calculating the 95% UCL. I went back to their internet site and re-read most of the document (before I started to fall asleep!). As a casual observation, it looks like it should be able to produce acceptable results. However, you know that its the assumptions that go with the stats that must also be evaluated when looking at statistical results. The assumptions that are made in MDEQ's program are not transparent (at least to me on a Tuesday morning).

I think the best approach to evaluate the results will be to ask the facility to provide the data set, in an electronic format, along with the output from the MDEQ program. We should evaluate:

1. The number of samples;
2. The sample locations and depths;
3. The number of non-detects (and how the facility treated non-detects);
4. The underlying data distribution (normal or log-normal); and
5. The presence of outliers

This is our normal evaluation procedure and it also reflects the MDEQ process. At this point, we can evaluate using our own programs whether the calculated 95% UCl would be the same or similar to what we ourselves would achieve. I know that this is more work, so you may choose to ignore my advice. I can also help you with the analysis or do the analysis for you if you choose. Y'all are lucky in NWDO in that you have a program called NCSS. It can do all the work for you with a minimal amount of effort. I know Ali has used the program, you may want to ask him to help you if your not familiar with it. I can also help you if you need some help with interpreting the results.

Let me know if you need more information or would like me to help you.

Erik

>>> Kara Reynolds 10/06/03 03:49PM >>>
Hello Erik,

I had a facility send me this link and ask if they could use this to calculate their UCLs. I was wondering if you had any experience with this site and what you thought about it. Mainly if this was ok to use to get UCLs or not. And if you haven't, what do I need to do to make sure it is ok. Any information you can give me will help.

Thanks a lot!!

Attached you will find the table (multiple tabs) which was used on the MDEQ statistic web site to calculate the UCL and distribution of select carcinogens. In addition, are the outputs of the distribution analysis for each compound in .gif format. The .pdf file is the output of the UCL analyses.

If you would like to go to the website to see how it works with actual data the address is http://www.deq.state.mi.us/stats/default.jsp. From this page just click the "Start" button. Next is a file upload page. To upload the data of interest the tab which contains it must be the first in line. Once you upload the file a page open confirming the data, just click the "Confirm Upload" button. The page that opens is where everything can be done. For the distributions, the individual compound tabs need to be used and the UCL (working) tab for the UCL calculations.

When doing anything with I(1,2,3-cd)P choose "Ideno(1" from the pull down. it doesn't like all the numbers and commas. If you have any questions on using the site please do not hesitate to give me call.

From: "Michael Kovacich" <mkovacich@geotransinc.com>
To: <Kara.Reynolds@epa.state.oh.us>
Date: 10/1/03 4:54PM
Subject: Campbell's Questions

Kara,

We would like clarification on 2 issues for the Revised Certification Report:

1) Laboratory QA/QC packages:

We are including QA/QC packages for both labs used during remediation activities (Brighton Analytical and BEC). Should we include QA/QC packages for the September 2002 soil sampling event?

We are having an independent party complete a laboratory validation report by filling out the Ohio EPA Tier I Checklist. Our lab contact and sub consultant suggest that Level III and Level IV on the attached PDF file (laboratory QA/QC) list best represents the level of QA/QC requested in Comment 23 of the Notice of Deficiency. Please review the attached file and let us know if Level III plus a case narrative meets your requirements.

Brighton Analytical has nearly completed their QA/QC package. They have explained that the paper file generated will be nearly 1 foot tall when single sided. They explained to me that in order to meet the requirements listed in Comment 23 of the notice of deficiency they will have to provide the raw data even though you did not specifically request it. We plan to scan both lab packages and include a compact disk(s) with the Revised Certification Report. Will this suffice?

2) Statistical Evaluation

We wanted to verify with you the following process. We plan to complete a statistical evaluation (i.e. determining if the data is normally distributed) for all parameters in which an UCL, instead of a maximum concentration, is used in the risk assessment. Normal or log-normal distribution will be determined from only the samples with detections (for example, ~120 samples are now being used in the risk assessment. For benzo(a)pyrene there were 15 detections above the MDL out of the ~120 samples. We determined the 15 samples with detections were log- normally distributed.) After determination of normal or log-normal distribution we will reintroduce the non-detect values at ½ the MDL and run the appropriate UCL calculation. We plan to the use the statistical software available on the Michigan Department of Environmental Quality's web page, which can be found at http://www.michigan.gov/deq/0,1607,7-135-3311_4109_9846---,00.html , bottom of the page under Part 201 StatSoft. This software will be used to determine normal or log-normal distribution and to calculate the UCL. Is this process acceptable to the Ohio EPA?

Please respond at your earliest convenience.

Thanks,

CC: <osman_aly@campbellsoup.com>, "Tesha Humphriss" <thumphriss@geotransinc.com>, <o.aly@worldnet.att.net>

Re: Campbell Soup Supply Company - Napoleon, OH
Release LOC Nos. P-226893, P-226892 and Standby Trust Funds

Dear Ms. Osborn:

The JP Trust Company, NA established Standby Letters of Credit (LOC) Nos. P-226893, P-226892 and Standby Trust Agreements to demonstrate the Campbell Soup Supply Company's (CSC) compliance with the hazardous waste financial assurance and third party liability requirements for the Napoleon, Ohio facility.

The CSC has since closed the Napoleon, Ohio facility and is no longer subject to financial assurance and liability requirements. I am, therefore, returning LOC Nos. P -226893 and P-226892 and both Trust agreements dated June 15, 2002 to you for termination pursuant to Ohio Administrative Code Rule 3745-66-43 (C)(9)(a).

Please feel free to contact Tina Jennings of the Division of Hazardous Waste Management with any questions you may have. Her telephone number is (614) 644-2951.

Sincerely,

Christopher Jones

Subject: Re: Campbell Soup

I looked over their July 27, 2004, letter/package regarding termination of the F&Os. Looks ok. Not aware of any other issues.

>>> Jeanette Smith 08/19/04 02:14PM >>>
Hi, we had some rain late last night (AM). Need the rain though. Did it rain up your way?

I didn't know that you were assigned to CSC (ID # 005 419 171) so I talked to Mike T. Since I verified that they paid the civil penalty ($80K) & Mike issued a Final Closure Letter we agreed that CSC had satisfied the F&Os & that they should be terminated.

Do you know of any outstanding issues? Please let me know ASAP B/C the orders termination letter is in sign-off.

>>> Don North 08/19/04 12:35PM >>>
Hi Jeanette,

I should be able to look over the letter from Campbells by Tuesday AM. Hope you're staying dry.

RE: Director's Final Finding and Orders of October 18, 2000 and
Amendment of August 22, 2001
Campbell Soup Supply Company, Napoleon, Ohio
Former Holding Pit – OH 005 419 171

- Notice of Satisfaction of All Obligations
- Request for Termination of the Orders

Gentlemen:

Pursuant to Section VI. Termination of the above Orders, this letter is to inform you that Campbell Soup Company and Campbell Soup Supply Company L.L.C. (Campbell) have performed and satisfied all the obligations under these Orders and believe that the Orders can be terminated. The required certification is attached to this letter.

The following is a demonstration that all the obligations under these Orders have been performed:

A. Ohio EPA issued a Final Closure Letter for Non-Permitted Facilities dated June 11, 2004 (copy attached) indicating that Campbell had closed the former holding pit according to the approved closure plan and Ohio Administrative Code (OAC) rules 3745-66-11 through 3745-66-15. The letter also indicated that Campbell is no longer subject to the financial assurance requirements for closure or liability coverage.

B. The following is the demonstration that Campbell performed each of the Orders in Section V:

Order #	Comments
1.	Closure of the pit proceeded as directed. A site closure investigation work report dated November 2, 2000 was submitted to Ohio EPA as required (copy attached in Appendix 1).
2.	Ohio EPA received the closure investigation report and outlined deficiencies in a letter dated April 3, 2001 (copy attached in Appendix 2). Because of the time delay Campbell requested withdrawal of the submitted plan and requested a 90-day delay for submittal of a revised closure plan (copy attached in Appendix 2). Ohio EPA subsequently amended the Orders effective August 22, 2001. Campbell submitted a revised closure plan as directed dated October 29, 2001. Ohio EPA issued a "Notice of Deficiency – Closure Plan" dated April 23, 2002. A revised closure plan was submitted in a letter dated May 23, 2002 (copy attached in Appendix 2).
3.	Ohio EPA approved the revised closure plan in a letter dated August 1, 2002 (copy attached in Appendix 3). Campbell subsequently proceeded with the implementation of the approved closure plan pursuant to the specifications and schedules contained in the plan. Campbell requested minor modification to the site closure plan in a letter dated March 6, 2003 (copy attached in Appendix 3). Ohio EPA approved the minor change to the approved closure plan in a letter dated March 11, 2003 (copy attached in Appendix 3).
4.	Campbell completed the scheduled closure activities and submitted a site closure certification reported dated July 3, 2003 (copy attached in Appendix 4). Ohio EPA issued a Notice of Deficiency for the certification report in a letter dated September 4, 2003 (copy attached in Appendix 4), and a second letter dated September 16, 2003 granting an extension to the Certification revision period (copy attached in Appendix 4).

On December 18, 2004, Ohio EPA issued a letter giving Campbell three options for determination of the appropriate exposure and risk (copy attached in Appendix 4). Campbell chose one of the options as outlined in a letter to Ohio EPA dated January 6, 2004 (copy attached in Appendix 4), and implemented that option and submitted a site closure sampling and analysis plan in a letter dated February 2, 2004. Ohio EPA requested revision of the sampling plan in a letter dated February 19, 2004 (copy attached in Appendix 4). A revised sampling and analysis plan was subsequently submitted on February 24, 2004. Ohio EPA approved the revised sampling and analysis plan in a letter dated March 5, 2004 (copy attached in Appendix 4).

The soil sampling analytical results were submitted to Ohio EPA in a letter dated April 2, 2004. Ohio EPA reviewed the analytical results and agreed with the conclusions and requested a revised certification document in a letter dated April 21, 2004 (copy attached in Appendix 4).

Campbell submitted a revised Certification report as required, in a letter dated May 19, 2004 (copy attached in Appendix 4).

A Final Closure Letter for Non-Permitted Facilities was issued by Ohio EPA in a letter dated June 11, 2004 (copy attached) indicating, as outlined in Section A above, that Campbell closed the former pit as required by the Orders.

5. Campbell submitted to Ohio EPA in a letter dated July 18, 2004 as required, a closure cost estimate and documentation demonstrating the establishment of financial assurance and liability coverage for closure in accordance with OAC rules 3745-55-42/3745-66-42 through 3745-55-47/3745-66-47 (copy attached in Appendix 5).

6. Campbell paid to Ohio EPA the amount of $80,000 in settlement of Ohio EPA's closure for civil penalties. The payment was made by sending a certified check as required. A copy of the transmittal letter with the certified check is attached in Appendix 6.

We would appreciate your approval and termination of these Orders at your earliest convenience. Please contact me at (856) 968-4423 if any additional information is needed.

Sincerely,

CAMPBELL SOUP COMPANY

Camden, New Jersey 08103-1799

Re: Final Closure Letter for Non-Permitted Facilities
Campbell Soup Supply Company, Napoleon
OHD 005 419 171

Dear Dr. Aly:

On August 1, 2002, Ohio EPA approved the closure plan for the former hazardous waste holding pit located at Campbell Soup Supply Company, 1273 State Route 110, Napoleon, Ohio, 43545.

On May 20, 2004, May 25, 2004, and June 1, 2004, the director received final certification documents from Dr. Osman M. Aly, Environmental Coordinator for Campbell Soup Company. C. M. Del Sol and Daniel L. Morgan certified that the former holding pit has been closed according to the specifications in the approved closure plan. The type of closure was clean closure via risk assessment.

To verify Campbell Soup Supply Company's closure activities, Kara Reynolds from Ohio EPA's Northwest District Office, conducted a final inspection of the former holding pit on June 9, 2004. She also reviewed documents pertaining to the closure of the unit and determined that the activities proposed in the closure plan were conducted adequately.

Based on this inspection and review, Ohio EPA has determined that Campbell Soup Supply Company has closed the former holding pit according to the approved closure plan and Ohio Administrative Code (OAC) rules 3745-66-11 through 3745-66-15.

Although Campbell Soup Supply Company has satisfied its closure obligations under Ohio's hazardous waste laws for the former holding pit, Campbell Soup Supply Company is still required to investigate and possibly clean up contamination of hazardous waste or constituents at the facility, despite the time at which the waste was placed in the unit. This obligation to investigate and possibly clean up contamination from past activities is also known as RCRA Corrective Action.

Printed on Recycled Paper

Our records show that Campbell Soup Supply Company used a letter of credit to demonstrate compliance with the state's hazardous waste financial assurance requirements for closure and liability coverage. Because there are no other units at the facility that require closure, Campbell Soup Supply Company is no longer subject to the financial assurance requirements for closure or liability coverage. However, the director will issue a separate letter releasing the financial assurance mechanism.

There are no other units at this facility that require closure. Campbell Soup Supply Company will maintain the status of conditionally exempt small quantity generator of hazardous waste.

If you have any questions concerning the closure process or the status of the facility, please contact Kara Reynolds by phone at (419) 373-3065, or by mailing address at Ohio EPA, Northwest District Office, Attn: Kara Reynolds, 347 North Dunbridge Road, Bowling Green, Ohio 43402.

Sincerely,

Re: Henry County
Campbell's Soup Company
OHD 005419171
Hazardous Waste

April 3, 2001

Mr. Michael Maringer
Manager, Service and Utilities
Campbell's Soup Company
East Maumee Avenue
Napoleon, Ohio 43545

Dear Mr. Maringer:

On October 1, 2000, this office received a report from Campbell's Soup Company (Campbell's) entitled RCRA Site Closure Investigation Work Plan: Former Holding Pit Area. The Ohio Environmental Protection Agency (Ohio EPA) has reviewed the document and offers the following comments:

1. Campbell's has not identified the full horizontal or vertical range of contamination. The sampling points provided to Ohio EPA in Figure 3 are acceptable, although more locations may be necessary if contamination is widespread. Campbell's is directed to sections 3.14 and 3.14.1 of Ohio EPA's Closure Plan Review Guidance for RCRA Facilities, Part I. Of particular importance is the need to sample vertically until 2 to 4 consecutive samples in the vertical direction and 2 samples in the horizontal direction show that concentrations of constituents are below their respective method detection limits (MDLs). Also, vertical sampling should extend at least 3 to 5 feet beyond the last point where a contaminant's concentration was above its detection limit.

2. The closure plan must state that the former sludge-holding pit was used from 1981 through 1983.

3. The closure plan must provide an estimate of the maximum volume of hazardous waste sludge present in the pit during its operation.

4. The closure plan must state that the waste codes associated with the wastes stored in the pit. Ohio EPA believes the appropriate codes to be D001, F003, and F005 based on sampling results, the materials' use as solvents, and MSDS sheets for the solvents provided to Ohio EPA by Campbell's.

Printed on recycled paper
(revised 2/99)

5. The closure plan must specify methods for the removal of waste and contaminated media. Information pertaining to staging, loading, and transportation of this material must also be included, as well as the land disposal restrictions (LDR) status of each waste stream relative to treatment and disposal. Campbell's should consult section 3.6 of Ohio EPA's Closure Plan Review Guidance for RCRA Facilities, Part I for more detail.

6. Campbell's must include a description of how sampling equipment and reusable equipment (such as earth movers) will be decontaminated.

7. Campbell's must provide an estimate of how waste material generated from decontamination will be managed. Campbell's must also supply an estimate of the volume of waste material generated by decontamination efforts in the closure plan.

8. Campbell's may use a mobile laboratory for sample screening purposes only. The mobile laboratory should not be used for confirmation sampling or risk assessment purposes.

9. Campbell's closure plan must state that organic constituents must be below method detection limits in order to determine the full extent of contamination.

10. Campbell's closure plan must describe each step in removing waste and contaminated soil from the property. Campbell's should consult section 3.15 of Ohio EPA's Closure Plan Review Guidance for RCRA Facilities, Part I for more information on this subject.

11. Campbell's closure schedule must begin at the point of the director's approval and should be in the form of a milestone chart. The schedule should contain at least dates for soil removal, dates when a professional engineer will be present, dates for backfilling of soil, etc.

12. The closure plan must state that the Ohio EPA inspector will be notified at least 5 days in advance of all critical activities relating to the closure. These activities would include: initial day field activities begin, sampling of soils or ground water, and removal activities.

13. Campbell's closure certification must contain the exact wording found in Ohio Administrative Code rule 3745-50-42(D). The certification document must contain at least the information listed in section 3.18 of Ohio EPA's Closure Plan Review Guidance for RCRA Facilities, Part I.

This review should not be construed to constitute a complete review of Campbell's closure plan for the former holding pit area. The plan will be addressed in detail in future correspondence. This review did not include joint review by Ohio EPA's Division of Drinking and Ground Waters. If you have any questions, feel free to contact me at (419) 373-3070.

Sincerely,

Michael R. Terpinski

Withdrawal of Earlier Work Plan Submission

Gentlemen:

This is to request withdrawal of our previous submittal of "RCRA Closure Investigation Work Plan – Former Holding Pit Area" dated November 2, 2000. Also, we request your approval of extension of the time required for submittal of RCRA Closure Plan for 90 days from the date of this letter. Pursuant to our discussion with Mr. Mike Terpinski, this extension will allow the completion of sampling activities and to obtain the necessary information for the preparation of an appropriate Closure Plan in accordance with OAC rules.

Please give me a call at 856-968-4423 if you have any questions.

Sincerely,

CAMPBELL SOUP COMPANY

RE: Revised RCRA Closure Plan
Campbell Soup Company
OEPA ID #OHD005419171

Dear Mr. Moseley:

Enclosed please find the revised RCRA closure plan for the former sludge pit unit located at Campbell Soup Company's facility located at 1273 State Route 110, Napoleon, Ohio.

The revised closure plan is submitted as requested in your letter of Notice of Deficiency dated April 23, 2002. The revised closure plan addressed all the areas indicated in the deficiency comments. The revised plan was prepared in accordance with the editorial protocol outlined in your letter.

We would appreciate your review and approval of the closure plan at your earliest convenience. Please call me at 856-968-4423 if you have any questions.

Sincerely,

CAMPBELL SOUP COMPANY

Re: **Revised Closure Plan Approval**
Campbell Soup Company
USEPA/OEPA ID# OHD005419171

Dear Dr. Aly:

On October 31, 2001, GeoTrans Inc., on behalf of Campbell Soup Company (Campbell), submitted to Ohio EPA a closure plan entitled RCRA Site Closure Plan, Former Holding Pit Unit for a sludge pit unit formerly operated on the property. The facility is located at 1273 State Route 110, Napoleon, Ohio 43545. Revisions to the closure plan were received May 28, 2002, and July 15, 2002. The closure plan was submitted pursuant to the revised Director's Final Findings and Orders issued August 22, 2001, and Ohio Administrative Code (OAC) 3745-66-12 in order to demonstrate that Campbell's proposal for closure complies with the requirements of rules OAC 3745-66-11 and 3745-66-12.

The owner and the public were given the opportunity to submit written comments regarding the closure plan in accordance with the hazardous waste rule requirements. The public comment period extended from November 21, 2001, through December 20, 2001. No public comments were received by Ohio EPA.

Based upon review of Campbell's submittal and subsequent revisions, I conclude that the amended closure plan for the hazardous waste facility at 1273 State Route 110, Napoleon, Ohio 43545, as modified herein, meets the performance standard contained in OAC rule 3745-66-11 and complies with the pertinent parts of OAC rule 3745-66-12.

The amended closure plan originally submitted to Ohio EPA on October 31, 2001, and revised on May 28, 2002, and July 15, 2002, by Campbell is hereby approved with the following modifications:

I certify this to be an accurate and complete copy of official documents in the Ohio Environmental Protection Agency

Approval with Modifications to Revised Closure Plan
Campbell Soup Company

Ohio EPA has determined that several site characterization activities must be performed by the facility to meet the general closure standards for hazardous waste facilities and the specific standards for the closure of surface impoundments. These activities must be completed as part of the closure period. Site investigation results will determine whether additional closure activities are needed or whether closure certification can be completed. The nature and extent of post-closure monitoring will also be directed by the results from sampling activities outlined in Section 14.4.

General Modifications to the May 28, 2002, Revised Closure Plan

1 No excavation activities as outlined in this plan shall be undertaken until any and all authorizations necessary to perform the actions contained herein are obtained from Ohio EPA. This includes any permits necessary pursuant to compliance with OAC rules 3745-31-02 and 3745-35-02. Copies of such authorization(s) shall be received by the Division of Hazardous Waste, NWDO prior to beginning any excavation.

2 Campbell shall follow standard industry protocols while investigating the potential for impact to shallow ground water including those activities outlined in Section 14.1. Data that demonstrates appropriate well construction, boring, development, and sampling logs as well as all other pertinent monitoring well information and ground water analytical results shall be generated and compiled during this investigation for submission to Ohio EPA. Standards for such activities can be found in the Ohio EPA guidance document entitle *Technical Guidance Manual for Hydrogeologic Investigations and Ground Water Monitoring* dated February 1995.

3 If analysis of water samples obtained from the ground water investigation show the shallow ground water has been impacted, within 30 days of receipt of the analytical results, Campbell shall submit an amended closure plan which includes a revised schedule for closure and details the measures to be undertaken to delineate and remediate the areas of contamination.

4 If Campbell is not able to demonstrate clean closure of the contaminated area at the time of submission of the certification report, Campbell shall either excavate and dispose of all contaminated material off-site or submit an amended closure plan which details the measures necessary to close as a surface impoundment in accordance with OAC rule 3745-67-28. Should the latter alternative be chosen, Campbell shall submit a closure/post-closure care plan pursuant to OAC rules 3745-66-10 through 3745-66-20 and 3745-68-10.

Specific Modifications to the May 28, 2002, Revised Closure Plan

5 Section 8, Schedule for Closure. The revised closure plan is hereby modified to state that Campbell will complete and submit a site health and safety plan to Ohio EPA, NWDO within 30 days of receipt of a notice of approval by Ohio EPA of the closure plan.

6 Section 8, Schedule for Closure. The revised closure plan is hereby modified to state all information generated during the shallow ground water investigation shall be submitted to Ohio EPA, NWDO within 30 days of the installation of the last monitoring well.

7 Section 8, Schedule for Closure. The revised closure plan is hereby modified to state Campbell will receive the results of closure verification sampling within 180 days of receipt of a notice of approval by Ohio EPA of the closure plan.

8 Section 8, Schedule for Closure. The revised closure plan is hereby modified to state Campbell will conduct the engineer inspection and certification of site closure within 180 days of receipt of a notice of approval by Ohio EPA of the closure plan.

9 Section 11, Decontamination Efforts. For sampling and analysis involving waste delineation and confirmation, Campbell shall collect field blanks at a frequency of 10% of the total number of samples sent to the laboratory at a minimum of one field blank per day. Field blanks shall consist of analyte-free water poured over decontaminated sample collection equipment. They shall be analyzed for each analysis requested for the soil samples being sent to the laboratory for that particular day of sample collection.

10 Section 14.4, Waste Characterization Sampling Plan. The revised closure plan is hereby modified to state material analyzed for the presence of hazardous waste characteristics as required by OAC rule 3745-52-11 shall utilize the Toxicity Characteristic Leaching Procedure (TCLP) extraction method. These samples shall be analyzed for the presence of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and metals using standard SW-846 methods.

11 Section 14.4, Waste Characterization Sampling Plan. The revised closure plan is hereby modified to state copies of manifests and receipts will be sent to Ohio EPA, NWDO for any waste disposed off-site. Campbell shall provide Ohio EPA with an estimate of volume for all wastes treated on-site and disposed off-site as a result of closure activities.

12 Section 17.0, Certification. The revised closure plan is hereby modified to state Campbell shall include a topographic map depicting the ground surface elevations of the mound and natural grade with a scale no greater than 1 inch equals 30 feet and a contour interval no greater than 5 feet. It shall also include detailed descriptions and locations of the topographic features in the vicinity of the mound and at Campbell's plant which may affect conditions at the mound (i.e., buildings, rivers, ditches, etc...).

13 Section 17.0, Certification. The revised closure plan is hereby modified to state that Campbell shall include a separate appendix in the closure certification report which contains all the data generated during the ground water investigation. This may be incorporated by reference if this information has already been submitted in its entirety to Ohio EPA, NWDO in distinct form. Lab data generated as part of this investigation may be placed elsewhere within the report.

14 Table 3 in the revised closure plan which contains the maximum concentrations for the constituents of concern is hereby replaced by the table in Attachment A.

End of Modifications

Compliance with the approved closure plan, especially including the modifications specified herein, is expected. Ohio EPA will monitor such compliance. Ohio EPA expressly reserves the right to take action, pursuant to chapters 3734. and 6111. of the Ohio Revised Code, and other applicable law, to enforce such compliance and to seek appropriate remedies in the event of noncompliance with the provisions and modifications of this approved closure plan. Please be advised that approval of this closure plan does not release Campbell from any responsibilities regarding corrective action for all releases of hazardous waste or constituents from any waste management unit, regardless of the time at which waste was placed in the unit.

You are hereby notified that this action of the Director of Environmental Protection is final and may be appealed to the Environmental Review Appeals Commission pursuant to Ohio Revised Code section 3745.04. The appeal must be in writing and set forth the action complained of and the grounds upon which the appeal is based. The appeal must be filed with the commission within 30 days after notice of the director's action. Notice of the filing of the appeal shall be filed with the director within three days after the appeal is filed with the commission. An appeal may be filed with the commission at the following address:

Environmental Review Appeals Commission
236 East Town Street
Room 300
Columbus, Ohio 43215

When closure is completed, OAC rule 3745-66-15 requires the owner or operator of a facility to submit to the director of Ohio EPA, certification by the owner or operator and an independent, registered professional engineer, that the facility has been closed in accordance with the approved closure plan.

The certification by the owner or operator shall include the statement found in OAC rule 3745-50-42(D). These certifications should be submitted to:

Ohio Environmental Protection Agency
Division of Hazardous Waste Management
Attn: Pamela Allen, Information Technologies and Technical Support Section
P.O. Box 1049, Columbus, Ohio 43216-1049

Ohio EPA, Division of Hazardous Waste Management, strongly encourages you to consider pollution prevention options for any processes at your facility that generate waste. While implementation of pollution prevention options is not required by Ohio laws and regulations, the application of waste minimization practices may help reduce the expense of remedial activities. Additionally, implementation of pollution prevention options may prevent the creation of new units and, as a result, eliminate the requirement to submit a closure plan in the future. For assistance in identifying and implementing pollution prevention options, contact Colleen Weaver at (419) 373-3059.

Sincerely,

Christopher Jones

RE: Campbell Soup Company, Napoleon Site
Revision to RCRA Schedule to Closure

Dear Mr. Moseley:

Campbell Soup Company initiated RCRA closure and excavation activities at the Napoleon, Ohio Plant (former holding pit unit) during the week of December 9, 2002. This was in advance of the schedule presented in our OEPA approved RCRA Closure Plan. However, the uncharacteristically warm weather we have experienced over the past three weeks and the on-set of wet weather has resulted in the need to construct a temporary road capable of supporting heavy equipment, and the need to obtain sand to reduce the moisture content of the soil prior to treatment. These conditions and several minor equipment repairs have resulted in the excavation and treatment proceeding at a pace slower than anticipated. Therefore, we are requesting a modification to the approved RCRA Closure Plan schedule.

According to the approved RCRA Closure Plan, the soil excavation and collection of the soil corrective action verification samples were to be completed by January 18, 2003. It now appears we will not be able to meet that schedule. We request that the OEPA amend our approved schedule to reflect completion of this task by February 18, 2003 and change the scheduled completion date for all subsequent activities dependent on this task as follows:

Receive results of closure verification	March 31, 2003
Conduct engineer inspection and certification of site closure	April 15, 2003
Complete excavation backfill and regarding	May 1, 2003

I would appreciate your approval at your earliest convenience. If you have any questions regarding this request, please do not hesitate to call me at 856 968-4423, or contact Mr. Craig Savage at 734 213-5042.

Sincerely,

CAMPBELL SOUP COMPANY

Re: Closure Period Extension
Campbell Soup Company
Former Holding Pit
USEPA/OEPA ID# OHD005419171

I certify this to be a true and accurate copy of the official document as filed in the Ohio Environmental Protection Agency.
By: Zona L Clemento Date: Feb, 20 03

Dear Dr. Aly:

On January 13, 2003, the Campbell Soup Company (Campbell), located at 1273 State Route 110, Napoleon, Ohio, submitted a request for an extension to the closure period specified in the approved closure plan dated August 8, 2002, of ninety-three days, until May 1, 2003. The extension request was submitted pursuant to Ohio Administrative Code (OAC) rule 3745-66-13(B) as closure will require longer than the 180 day period specified in OAC rule 3745-66-13. Campbell has requested this extension because uncharacteristically warm and wet weather in December has resulted in delays due to the need to construct temporary roads for support of heavy equipment. Several instances of equipment failure have also hampered Campbell's ability to meet the deadlines in the closure plan.

My staff reviewed your request for an extension to the closure period and recommends that the extension be granted per OAC rule 3745-66-13(B). I concur and am therefore granting this extension request. This extension is being granted for the above referenced closure plan and expires on May 1, 2003.

Campbell shall continue to take all steps to prevent a threat to human health and the environment from the unclosed, but inactive waste management unit per OAC rule 3745-66-13(B)(2).

Please be advised that approval of this closure extension request does not release Campbell from any responsibilities as required under the Hazardous and Solid Waste Amendments of

1984 regarding corrective action for all releases of hazardous waste or constituents from any solid waste management unit, regardless of the time at which waste was placed in the unit.

You are hereby notified that this action of the Director of Environmental Protection is final and may be appealed to the Environmental Review Appeals Commission pursuant to Ohio Revised Code section 3745.04. The appeal must be in writing and set forth the action complained of and the grounds upon which the appeal is based. The appeal must be filed with the commission within 30 days after notice of the director's action. Notice of the filing of the appeal shall be filed with the director within three days after the appeal is filed with the commission. An appeal may be filed with the commission at the following address:

Environmental Review Appeals Commission
236 East Town Street
Room 300
Columbus, Ohio 43215

When closure is completed, OAC rule 3745-66-15 requires the owner or operator of a facility to submit to the director of Ohio EPA, certification by the owner or operator and an independent, registered professional engineer that the facility has been closed in accordance with the specifications in the approved closure plan. The certification shall follow the format specified in OAC rule 3745-50-42(D), and should be submitted to: Ohio Environmental Protection Agency, Division of Hazardous Waste Management, Attn: Pamela Allen, Regulatory and Information Services Section, P.O. Box 1049, Columbus, Ohio 43216-1049.

Sincerely,

Christopher Jones
Director

Re: Minor Modification to RCRA Site Closure Plan
Former Holding Pit, Campbell Soup, Napoleon, Ohio

Dear Mr. Moseley:

Campbell Soup Supply Company (Campbell) has prepared this minor modification to the *RCRA Site Closure Plan (Closure Plan)* for the former holding pit unit in Napoleon, Ohio. A change in the closure plan activities has become necessary, due to changing site conditions. We have provided this document to explain the additional proposed activities to close this site and our proposed minor changes to the *Closure Plan*, dated May 24, 2002.

BACKGROUND

As outlined in Section 7.0 of the Closure Plan, thermal desorption treatment was chosen to remediate this site. Since beginning thermal treatment of the soils on December 12, 2002, the process has effectively destroyed VOCs in the soil. However, the thermal process did not completely destroy all of the SVOCs. For some portions of the elevated area, treated soil does not meet the unrestricted use criteria (clean-up criteria) established for the site.

Verification samples VR-03-04 and VR-03-05 collected from post treatment stockpiles #4 and #5, respectively, exhibit the highest concentrations of SVOCs and exceed the cleanup criteria established for the site. A potential source of the elevated SVOCs is roofing material (felts, flashing, and tar) that was encountered in the western portion of the excavation. Partially combusted pieces of roofing material were identified in post treatment stockpiles #4 and #5. Once the roofing material was identified, excavation activities were moved from the western portion of the elevated area, to the east, in the vicinity of the former holding pit. No roofing materials have been identified in this area. SVOC concentrations decreased in each post treatment stockpile sample, once excavation activities were moved to the former holding pit area.

Approximately 3,250 tons of additional contaminated soil has been encountered during excavation activities. The additional contaminated soil is attributable to the presence of contamination at higher elevations then expected, and in areas beyond the extent estimated during the remedial investigation. Approximately 1,000 additional tons of SVOC contaminated soil was encountered at an elevation of 685 feet, 2-feet above the closure plan delineation. The remaining 2,250 additional tons were primarily encountered along the western and southern portions of the elevated area were the ramp was constructed and where the ditch (old access road) is present.

CURRENT PROJECT STATUS

Thermal processing of the soil ceased on February 20, 2003, after approximately 5,750 tons of soil had been processed (approximately 4,950 tons of excavated soil and 800 tons of mixing soil). Thermal treatment was suspended for the following reasons:

- Treated soil containing roofing materials did not meet the clean-up criteria following one pass through the treatment system;
- Increase in the quantity of soil that needs to be removed from the site due to contamination extending beyond the limits of the delineation line;
- Propane use increased significantly during treatment due to high soil moisture content attributable unusually heavy rain and snow melt; and
- Propane costs increased significantly during the project.

Currently, we estimate that 3,000 tons of contaminated soil will be excavated from the elevated area (2,000 tons of SVOC soils and 1000 tons of soil from the former holding pit area). In addition, we estimate that there is approximately 500 tons of soil stockpiled at the thermal plant staging area. Therefore, approximately 3,500 tons of untreated soil still requires treatment or disposal.

Through discussions with the Ohio EPA toxicologist, we have determined that Campbell will use post closure conditions to close the site. As outlined in our consultant's (GeoTrans, Inc.) correspondence dated January 15, 2003, a statistical approach using GCN's will be used to obtain unrestricted closure of this site. When the results from samples collected from post treatment stockpiles #4, #5 and #11 are included in the statistical analysis, the site does not meet the unrestricted use criteria. In order to meet unrestricted criteria, these stockpiles (approximately 1,200 tons) will require additional treatment or disposal.

PROPOSED MINOR MODIFICATION TO CLOSURE PLAN

Campbell proposes disposing the soil offsite at two separate licensed facilities. Approximately 3,500 tons of untreated contaminated soil will be disposed offsite at the Williams County Solid Waste Landfill. The 1,200 tons of treated soil from stockpiles #4, #5 and #11 will disposed of off site, as daily cover at the Henry County Solid Waste Landfill.

In order to receive approval for offsite disposal of contaminated soil from the North West District Office, we request that the following minor modifications be made to the *Closure Plan*:

Page 20, third paragraph, please add the following sentence as the second sentence in that paragraph:

> On site treatment using medium thermal desorption will be used to treat up to 3,300 cubic yards (5,000 tons).

Page 22, first paragraph continued from page 21, please add the following sentences as the third and fourth sentences in that paragraph:

> A total of 3,300 yards (approximately 5,000 tons) will be treated using medium temperature desorption. If additional contaminated soils are encountered during the site excavation, these soils will be disposed offsite at an approved solid waste landfill.

Page 26, please add the following section following Section 9.2:

9.2 Offsite Disposal of Soil
Non hazardous waste manifest, bill of lading or other appropriate documentation will be generated for all soil removed from the site.

Page 29, last paragraph, please replace the second sentence with the following sentence:

The general strategy for meeting the cleanup numbers at this site involves removal through excavation and on-site treatment using medium thermal treatment thermal desorption and offsite disposal of contaminated soil encountered above 3,300 yards (approximately 5000 tons) or any treated soil that does not meet the cleanup criteria following one pass through the treatment system.

SCHEDULE

We are not proposing any changes to the current schedule as presented in our January 13, 2003 and February 10, 2003 letters to the Ohio EPA.

If you have any questions or wish to discuss any aspect regarding this minor modification to the *Closure Plan*, please do not hesitate to call me at 856 968-4423 or Michael Kovacich at 734-213-5024.

Sincerely,

Osman M. Aly, Ph. D.

Re: Minor Change to Approved Closure Plan
Campbell Soup Company
Former Holding Pit
USEPA ID# OHD005419171

Dear Dr. Aly:

On March 7, 2003, Ohio EPA received a request for modification to an approved closure plan for Campbell Soup Company located at 1273 State Route 110, Napoleon, Ohio. The original closure plan was approved on August 1, 2002. The requested modification meets the criteria for submission and approval of an amended closure plan as detailed in Ohio Administrative Code rule 3745-66-12 (C)(3).

The requested amendment to the approved closure plan is as follows:

- The third paragraph on Page 20 of the approved closure plan is hereby amended to add the following at the end of the paragraph: "On-site treatment using medium temperature thermal desorption will be used to treat up to 3,300 cubic yards (5,000 tons)."

- The first paragraph on page 22 continued from page 21 of the approved closure plan is hereby amended to add the following at the end of the paragraph: "A total of 3,300 yards (approximately 5,000 tons) will be treated using medium temperature thermal desorption. If additional contaminated soils are encountered during the site excavation, these soils will be removed and properly disposed off-site at a licensed solid waste landfill."

- Section 9.2 of the approved closure plan is hereby amended to add the following at the end of the section: "A non-hazardous waste manifest, a bill of lading, or other appropriate documentation will be generated for all soil removed from the site."

Printed on Recycled Paper

- The second sentence of the last paragraph on page 29 of the approved closure plan is hereby replaced with the following: "The general strategy for meeting the cleanup numbers at the site involves removal through excavation and on-site treatment using medium temperature thermal desorption and offsite disposal of contaminated soil encountered above 3,300 yards (approximately 5000 tons) or any treated soil that does not meet the cleanup criteria following one pass through the treatment system."

With this letter, Ohio EPA approves the above referenced modification to the approved closure plan, submitted pursuant to Ohio Administrative Code Chapter 3745-66-12.

If you have any questions concerning this action, please contact James Moseley at Ohio EPA's Northwest District Office by telephone at (419) 373-3015.

Sincerely,

Edwin J. Hammett
District Chief

RE: Campbell Soup Company, Napoleon Site
RCRA Site Closure Certification Report

Dear Ms. Reynolds:

This is to inform you that all the soil remediation and closure activities at Campbell Soup Company's site located at 1273 State Route 110, Napoleon, Ohio, have been completed on May 15, 2003 according to the approved RCRA Closure Work Plan.

Enclosed please find copies of a "Certification Report" prepared by GeoTrans, Inc., an independent registered professional engineer, certifying that the facility has been closed in accordance with the specifications in the approved closure plan. The certification was prepared following the format specified in OAC rule 374-5-50-53(D).

We would appreciate your review and approval of this certification report at your earliest convenience. If you have any questions, please call me at (856) 968-4423, or Michael Kovacich at (734) 213-5024.

Sincerely,

Re: Former Holding Pit -Notice of Deficiency (NOD)
RCRA Site Closure Certification Report
Campbell Soup Supply Company, Napoleon
OHD 005 419 171

Dear Dr. Aly:

On July 7, 2003, Ohio EPA received from Campbell Soup Company a closure certification report for the former holding pit unit located at 1273 State Route 110, Napoleon, Ohio. Ohio EPA received subsequent submittals from Campbell's on August 6, 2003 and August 12, 2003. The document is titled *RCRA Site Closure Certification Report, Former Holding Pit Unit.*

Ohio EPA, Division of Hazardous Waste Management (DHWM) has conducted a review of the above referenced certification report, and has determined it to be incomplete and technically inadequate.

We have enclosed, as an attachment to this correspondence, detailed deficiency comments on the certification report. Please provide a revised certification report addressing all areas indicated in the deficiency comments. Ohio Administrative Code (OAC) rule 3745-66-12 requires that such a revised certification report be submitted to the Director of Ohio EPA for approval within thirty (30) days of the receipt of this letter.

The revised certification report shall be prepared in accordance with the following editorial protocol or convention:

1) Old Language is over-struck, but not obliterated.

2) New Language is capitalized.

3) Page headers should indicate date of submission.

4) If significant changes are necessary, pages should be re-numbered, table of contents revised, and complete sections provided as required.

Printed on Recycled Paper

The revised certification report should be submitted to: Ohio Environmental Protection Agency, Division of Hazardous Waste Management, Attn: Pamela Allen, Manager, Regulatory and Information Services Section, P.O. Box 1049, Columbus, Ohio 43216-1049. A copy should also be sent to: Kara Reynolds, Ohio EPA, Northwest District Office, 347 North Dunbridge Road, Bowling Green, Ohio, 43402.

If you wish to arrange a meeting to discuss your responses to this Notice of Deficiency, please contact Kara Reynolds, at (419)-373-3065.

Ohio EPA, DHWM, strongly encourages you to consider pollution prevention options for any processes at your facility that generate waste. While implementation of pollution prevention options is not required by Ohio laws and regulations, the application of waste minimization practices may help reduce the expense of remedial activities. Additionally, implementation of pollution prevention options may prevent the creation of new units and as a result eliminate the requirement to submit a closure plan in the future. For assistance in identifying and implementing pollution prevention options, contact Colleen Weaver at (419)-373-3059.

Sincerely,

Michael R. Terpinski
Supervisor
Division of Hazardous Waste Management

Re: Certification Period
Campbell Soup Supply Company, Napoleon
Former Holding Pit Unit
OHD 005 419 171

Dear Dr. Aly:

On September 12, 2003, Campbell Soup Company (CSC), located at 1273 State Route 110, Napoleon, Ohio, submitted a request, via e-mail, for an extension to the certification revision period specified in the Notice of Deficiency (NOD) dated September 4, 2003. CSC has requested this extension because they would like to meet with the Ohio Environmental Protection Agency (Ohio EPA) to discuss the comments in the NOD before submitting a revised certification report. As stated in the e-mail from Michael Kovacich, CSC "received the Notice of Deficiency on September 8, 2003. The notice states that per OAC rule 3745-66-12, the revised certification report must be submitted to the Director for approval within thirty days of receipt of the letter. Therefore, the revised certification report is due to the Director on October 8, 2003. The earliest available date [to meet with Ohio EPA] September 29, 2003 only allows a maximum of 10 business days to revise and submit the certification report." CSC goes on to request an extension due to the period between the receipt of the NOD and the proposed meeting date.

I have reviewed your request for an extension to the certification revision period, and am granting this extension request. This extension is being granted for the above referenced certification report and expires thirty (30) days after the meeting between CSC and Ohio EPA.

Printed on Recycled Paper

The revised certification shall follow the format specified in the NOD, and should be submitted to: Ohio Environmental Protection Agency, Division of Hazardous Waste Management, Attn: Pamela Allen, Regulatory and Information Services Section, P.O. Box 1049, Columbus, Ohio 43216-1049. A copy should also be sent to my attention at Ohio EPA, Northwest District Office, 347 North Dunbridge Road, Bowling Green, Ohio, 43402.

Sincerely,

Kara Reynolds

Re: Former Holding Pit
RCRA Site Closure Certification Report
Campbell Soup Supply Company, Napoleon
OHD 005 419 171

Dear Dr. Aly:

On September 4, 2003, the Ohio Environmental Protection Agency (Ohio EPA) sent a Notice of Deficiency (NOD) to Campbell Soup Supply Company (CSC) for the *RCRA Site Closure Certification Report, Former Holding Pit Unit.* Comment 30 in the NOD requested that CSC perform statistical evaluations on the site data before completing the human health risk assessment. In response to our comment, CSC has submitted several documents and e-mails regarding a proposed statistical evaluation.

For risk purposes, CSC has chosen to use one-half the detection limit in the statistical determination of the exposure point concentration for certain chemicals. The facility used the Wilcoxon signed rank test and determined a 95% Upper Confidence Limit exposure point concentration that was well below the detection limit of the test. Even though the use of this procedure differs from Ohio EPA guidance, Ohio EPA does not disagree with the use of this statistical approach. However, Ohio EPA does not agree with the use of one half the detection limit with such highly censored data. According to U.S. EPA guidance, the use of one-half the detection limit is valid for statistical determinations, except in the case of highly censored datasets (see U.S. EPA, Guidance for Data Quality Assessment, 1998, section 4.73). Any statistical test using this type of data will determine an exposure point concentration that is biased to one half the detection limit value. This was indeed the case of the statistical evaluation submitted to Ohio EPA.

Ohio EPA cannot ignore the significance or the concentrations of samples with detections for a facility that is proposing a clean closure. In cases such as Campbell's, at other RCRA facilities, Ohio EPA requires either removal of impacted material or additional sampling to confirm the magnitude of contamination. However, the Campbell's facility presents something of a unique case because of the manipulation of soils after treatment activities had ceased. Therefore, Ohio EPA is willing to forego its normal procedure of having additional soil removed, if limited verification sampling is conducted to confirm that the soils will not pose a health risk now or in the future.

Ohio EPA is giving CSC the following options to choose from for determining the appropriate exposure and risk that contaminated media poses to human health and the environment.

a) CSC will be required to select a percentile, approved by Ohio EPA, of the highly censored data in the detectable range and use this value as the exposure point concentration in the risk assessment.

Printed on Recycled Paper

Ohio EPA has suggested the 90th percentile in the past; or

b) CSC will be required to sample the existing top layers of soil, using a Sampling and Analysis Plan (SAP) approved by Ohio EPA, to determine the existing exposure point concentrations for all chemicals of concern (COC). These concentrations will be used in place of the existing closure data to show the residential human health risk posed by the top layers of soil through direct contact pathways including ingestion, inhalation, and dermal exposure. This risk assessment will not include the entire unit and will leave out the undisturbed, contaminated soils below the top layers. If CSC passes the human health risk assessment, a deed restriction will be required that prohibits the soils in this area to be disturbed by CSC or any other owner/operator. This will be used to protect against future exposure from the undisturbed, impacted soils below the top layers. If CSC does not pass the risk assessment, then CSC will need to work with Ohio EPA to determine other options for closure (e.g., closing as a landfill per the approved closure plan letter); or

c) CSC will be required to take several core samples in the existing backfilled area, using a SAP subject to approval by Ohio EPA, to determine the validity of the present data. If the data is similar in both the new samples and the closure samples, then CSC will proceed with the proposed statistical evaluation and human health risk assessment as agreed upon by Ohio EPA. If the data indicates that it is not similar to the closure samples, then CSC will work with Ohio EPA to determine options for closure.

Ohio EPA would like to schedule a conference call with CSC to discuss these closure options. Please contact Kara Reynolds at (419) 373-3065 at your earliest convenience.

Sincerely,

Kara Reynolds

RE: Former Holding Pit
RCRA Site Closure Certification Report
Campbell Soup Supply Company, Napoleon, Ohio
OHD 005 419 171

Dear Ms. Reynolds:

This is in response to your letter of December 8, 2003 concerning the available options proposed by Ohio EPA to choose from for determining the appropriate exposure and risk that the contaminated media at the site poses to human health and the environment.

After review of the three options, Campbell Soup Company decided to proceed with option (c), which requires taking several core samples in the existing backfilled area, using a SAP subject to approval by Ohio EPA to determine the validity of the present data as outlined in your letter. Through e-mail correspondence, conference calls and a site visit, the Ohio EPA and Campbell have come to a general agreement on the elements of the Sampling and Analysis Plan (SAP) as required by option (c). The primary elements of the SAP were outlined in our December 30, 2003 e-mail. Campbell will submit a draft SAP that incorporates these elements to the Ohio EPA for your review and approval.

If you have any questions or concerns, please do not hesitate to call me at 856 968-4423, or contact Mr. Michael Kovacich at 734 213-5024.

Sincerely,

CAMPBELL SOUP COMPANY

Re: Former Holding Pit
RCRA Site Closure Sampling and Analysis Plan
Campbell Soup Supply Company, Napoleon
OHD 005 419 171

Dear Dr. Aly:

On February 2, 2004, this office received a document titled *RCRA Site Closure Sampling and Analysis Plan: Former Holding Pit Unit*. This document described a sampling and analysis plan for a sampling event to aid in the closure at the Napoleon site. Ohio EPA has reviewed the document and offers the following comments:

1. General. Campbell Soup Company (CSC) does not describe quality assurance/quality control (QA/QC) measures to be implemented during this sampling event. The Ohio Environmental Protection Agency (Ohio EPA) would like to remind CSC that Ohio EPA approved QA/QC measures should be followed during this sampling and analysis event to ensure the validity of the data. CSC shall provide Ohio EPA with enough QA/QC information to complete Ohio EPA's Data Validation Plan Review Form included in the September 4, 2003, Notice of Deficiency (NOD) letter as Appendix II, Tier I Checklist. This required information includes, but is not limited to, the following: completed chain of custody forms, signed laboratory statement, date samples received by laboratory, date samples extracted by laboratory, date samples analyzed by laboratory, method blank data, field blank data, laboratory control sample data, matrix spike data, and matrix spike duplicate data. CSC shall revise the Sampling and Analysis Plan (SAP) to include the necessary QA/QC procedures.

   Ohio EPA would also like to specifically request that duplicates be acquired at a rate of one duplicate per 10 samples, one duplicate sample per day, and at least two duplicate samples per the entire sampling event. CSC shall revise the SAP to include this procedure.

2. Section 2.2, Sampling Locations, Page 5. CSC does not propose to collect extra soil samples. Ohio EPA would like to recommend that extra samples be collected and held in case QA/QC or other problems demonstrate the necessity for additional samples.

Printed on Recycled Paper

3. Section 2.3, Sampling Procedure, Page 6. CSC has made several references to utilizing a photoionization detector (PID). A PID does not register the presence of semi-volatile organic compounds (SVOCs) and since the majority of the chemicals of concern (COCs) that are expected to exist in these samples are SVOCs, Ohio EPA does not understand the relevance to using this instrument. CSC shall add language in this section to clearly state that Encore samples for volatile constituents shall be taken first, prior to taking soil for screening purposes.

4. Section 2.3, Sampling Procedure, Page 6. CSC has not described waste handling procedures to be utilized during the sampling event. CSC shall revise the SAP to provide this information. CSC shall also include the process used to handle both the solid and liquid waste from the sampling event, where the waste will be disposed, how the waste will be transported, estimates of the volume of solid/liquid waste that will be generated from the sampling event, etc.

5. Section 2.4, Laboratory Analysis, Page 7. CSC has omitted an important analytical method from this section. CSC shall revise the SAP to include Method 5035 in this section.

6. Section 2.4, Laboratory Analysis, Page 7. It is unclear as to whether constituents will be removed from the list of analysis while using the specified EPA methods. CSC will analyze all samples for the appropriate list of COCs that correspond with the EPA 8260B and 8270 methods, including all 68 site specific COCs. CSC will not remove any COCs from the list of analysis for these methods.

7. Section 2.4, Laboratory Analysis, Page 7. Ohio EPA has found that the definition of "reporting limit" varies depending on the laboratory employed. As such, CSC shall revise the SAP to include a definition for reporting limit in this section.

   Also, CSC shall describe the reporting procedures in more detail. CSC shall include in the revised SAP whether results above the method detection limit will be reported and steps taken if the reporting limit is elevated above the risk level.

8. Section 2.5, Data Evaluation, Page 7. CSC describes the screening criteria as the following: "The minimum screening concentration is equal to the reporting limit. The maximum screening concentration was calculated by multiplying the existing maximum detected concentration by 1.15." CSC shall revise the screening analysis discussion in this section and all subsequent sections to demonstrate that the minimum screening criteria is the minimum detection limit and the maximum screening criteria is the maximum detected concentration. If the results from the sampling event do not correspond with these levels, then alternatives will be proposed. Until then, Ohio EPA requests that the data lists not be manipulated.

9. Section 3.2, Risk Assessment Methodology, Page 9. The first sentence in this section reads "The maximum detected concentration or Upper Confidence Limit (UCL) for each chemical of concern, except the five described below, will be divided by . . . " CSC proceeds to reference Comment 37 of the NOD dated September 4, 2003. Ohio EPA's reasoning behind Comment 37 is based on different criteria including, but not limited to, frequency of detection of these COCs and remediation/removal of the corresponding sampled soil. If these COCs are present in any samples, then these chemicals will need to be evaluated. As such, Ohio EPA requests that CSC proceed by assuming that the five COCs listed in this section will be included in the risk assessment. If all samples show that these five COCs are not detected, then they will not be included in the risk assessment as long as the criteria in Comment 37 of the NOD are met. CSC shall delete all references in the SAP that exclude the five COCs in the risk assessment.

10. Section 3.2.1, Preliminary Risk Assessment, Page 10. The first sentence of this section reads "The maximum concentration of each COC (except the five specified above) from the 165 samples shown in Table 3 . . . " Table 3 lists 170 samples from the closure. Of these 170 samples, Ohio EPA believes that 169 of these samples should be included in the risk assessment. Sample IS-02-02 did not meet QA/QC qualifications and was resampled. This sample does not need to be included in the evaluation. However, CSC has not provided an explanation on the four remaining samples omitted from the risk assessment. Ohio EPA requests that CSC explain the reasons for excluding these samples.

11. Table 1, Chemicals of Concern with GCN's. CSC does not list the units associated with the reporting limit on this table. CSC shall include this information in the revised SAP.

12. Table 1, Chemicals of Concern with GCN's. CSC has not included the five COCs that were referenced in Comment 37 of the September 4, 2003, NOD. CSC shall revise the table to include the five COCs that were omitted as explained in Section 3.2, Risk Assessment Methodology.

13. Table 2, Existing Backfill Analytical Data. Ohio EPA accepts J valued data. As such, CSC shall revise this table to show the maximum concentration under "Screening Criteria" regardless of its estimated value.

14. Table 2, Existing Backfill Analytical Data. The minimum concentration under "Screening Criteria" is not always listed as the minimum detection limit. CSC shall revise the table to show the minimum concentration under "Screening Criteria" to be the minimum detection limit.

15. Table 2, Existing Backfill Analytical Data. CSC has shown the maximum concentration under "Screening Criteria" as the maximum concentration of the COC multiplied by 1.15. CSC shall revise this column to show that the maximum concentration under "Screening Criteria" is the maximum concentration of the COC.

If the results from the sampling event do not correspond with these levels, then alternatives will be reviewed. Until then, Ohio EPA requests that the data lists not be manipulated.

Please provide a revised Sampling and Analysis Plan (SAP) within thirty (30) days of the receipt of this letter.

The revised SAP should be prepared in accordance with the following editorial protocol or convention:

1) Old Language is over-struck, but not obliterated.

2) New Language is capitalized.

3) Page headers should indicate date of submission.

4) If significant changes are necessary, pages should be re-numbered, table of contents revised, and complete sections provided as required.

If you wish to arrange a meeting to discuss responses to this letter, please contact me at (419) 373-3065 at your convenience.

Sincerely,

Kara Reynolds

Re: Sampling and Analysis Plan Approval
Campbell Soup Supply Company, Napoleon
Former Holding Pit
OHD 005 419 171

Dear Dr. Aly:

On February 2, 2004, Campbell Soup Company submitted to the Ohio Environmental Protection Agency (Ohio EPA) a sampling and analysis plan (SAP) for the former holding pit located in Napoleon, Ohio. This document was titled *RCRA Site Closure Sampling and Analysis Plan*. Ohio EPA reviewed this document and issued comments to Campbell Soup Company on February 19, 2004. Campbell Soup Company issued a revised document titled *RCRA Site Closure Revised Sampling and Analysis Plan* on February 24, 2004.

Ohio EPA has reviewed the *RCRA Site Closure Revised Sampling and Analysis Plan* and is hereby approving the SAP. Campbell Soup Company shall notify the Ohio EPA at least five (5) days prior to beginning the field work associated with the SAP.

Sincerely,

Kara M Reynolds

Re: Former Holding Pit
Soil Sampling Analytical Results from the *RCRA Site Closure Revised Sampling and Analysis Plan*
Campbell Soup Supply Company, Napoleon
OHD 005 419 171

Dear Dr. Aly:

On February 24, 2004, Campbell Soup Company (CSC) submitted to the Ohio Environmental Protection Agency (Ohio EPA) a revised sampling and analysis plan for the former holding pit located in Napoleon, Ohio. This document was titled *RCRA Site Closure Revised Sampling and Analysis Plan*. Ohio EPA approved this document on March 5, 2004. CSC completed sampling of the former holding pit on March 17, 2004 and submitted the soil sampling analytical results to Ohio EPA on April 5, 2004.

Ohio EPA has reviewed the analytical results and agrees with the conclusions provided in the cover letter. In particular, Ohio EPA believes that the data obtained from the March 17, 2004 sampling event is similar to the data used to represent the backfilled area. However, to this date Ohio EPA has not received quality assurance/quality control (QA/QC) information for the March 17, 2004 sampling event. Without this information, Ohio EPA cannot finalize conclusions on the data. Although Ohio EPA needs to review the QA/QC information before finalizing conclusions, Ohio EPA does not intend to delay the closure process further. Therefore, Ohio EPA is granting CSC permission to include the QA/QC information from the March 17, 2004 sampling event in the revised certification document.

If you wish to arrange a meeting to discuss responses to this letter, please contact me at (419) 373-3065 at your convenience.

Sincerely,

Kara Reynolds

Revised RCRA Site Closure Report
Campbell Soup Supply Company, Napoleon, Ohio
OHD 005 419 171

Dear Ms. Reynolds:

Enclosed please find a copy of a "Revised RCRA Site Closure Report" prepared by GeoTrans, Inc., an independent registered professional engineer, certifying that the facility has been closed in accordance with the specifications in the approved Closure Plan and the Revised Sampling Plan that was approved in your letter of March 5, 2004. This QA/QC information for the analytical results of the Revised Sampling Plan are included in the closure report as requested in your approval letter dated April 21, 2004.

The Revised Certification Report was prepared following the format specified in OAC rule 374-5-50-53 (D). Campbell Soup Company's Certification is attached to this letter.

We would appreciate your review and approval of closure of the site at your earliest convenience. If any additional information is needed, please contact me at (856) 968-4423 or Mike Kovacich at (734) 213-5024.

Sincerely,

EPA I.D. No.: OHD: 005 419 171
Request for Release of Financial Assurance Mechanism

Dear Ms. Jennings:

The Ohio EPA issued a Final Closure Certification Approval letter dated June 11, 2004, indicating that Campbell Soup Company has closed the above site according to the approved closure plan and Ohio Administrative Code (OAC) rules 3745-66-11 through 3745-66-15, as required by the Director's Final Findings and Orders of October 18, 2000. The letter also indicated that Campbell is no longer subject to the final assurance requirements for closure or liability coverage.

Therefore, we request the release of the following documents:

1. Irrevocable Standby Letter of Credit No. P-226893 for closure or post closure care.
2. Standby Trust Agreement for Bodily Injury and Property Damage;
3. Irrevocable Standby Letter of Credit No. P-226892 for the Bodily Injury and Property Damage;

4. Standby Trust Agreement for Closure or Post-Closure Care.

Re: Final Closure Letter for Non-Permitted Facilities
Campbell Soup Supply Company, Napoleon
OHD 005 419 171

Dear Dr. Aly:

On August 1, 2002, Ohio EPA approved the closure plan for the former hazardous waste holding pit located at Campbell Soup Supply Company, 1273 State Route 110, Napoleon, Ohio, 43545.

On May 20, 2004, May 25, 2004, and June 1, 2004, the director received final certification documents from Dr. Osman M. Aly, Environmental Coordinator for Campbell Soup Company. C. M. Del Sol and Daniel L. Morgan certified that the former holding pit has been closed according to the specifications in the approved closure plan. The type of closure was clean closure via risk assessment.

To verify Campbell Soup Supply Company's closure activities, Kara Reynolds from Ohio EPA's Northwest District Office, conducted a final inspection of the former holding pit on June 9, 2004. She also reviewed documents pertaining to the closure of the unit and determined that the activities proposed in the closure plan were conducted adequately.

Based on this inspection and review, Ohio EPA has determined that Campbell Soup Supply Company has closed the former holding pit according to the approved closure plan and Ohio Administrative Code (OAC) rules 3745-66-11 through 3745-66-15.

Although Campbell Soup Supply Company has satisfied its closure obligations under Ohio's hazardous waste laws for the former holding pit, Campbell Soup Supply Company is still required to investigate and possibly clean up contamination of hazardous waste or constituents at the facility, despite the time at which the waste was placed in the unit. This obligation to investigate and possibly clean up contamination from past activities is also known as RCRA Corrective Action.

Printed on Recycled Paper

Our records show that Campbell Soup Supply Company used a letter of credit to demonstrate compliance with the state's hazardous waste financial assurance requirements for closure and liability coverage. Because there are no other units at the facility that require closure, Campbell Soup Supply Company is no longer subject to the financial assurance requirements for closure or liability coverage. However, the director will issue a separate letter releasing the financial assurance mechanism.

There are no other units at this facility that require closure. Campbell Soup Supply Company will maintain the status of conditionally exempt small quantity generator of hazardous waste.

If you have any questions concerning the closure process or the status of the facility, please contact Kara Reynolds by phone at (419) 373-3065, or by mailing address at Ohio EPA, Northwest District Office, Attn: Kara Reynolds, 347 North Dunbridge Road, Bowling Green, Ohio 43402.

Sincerely,

TIER I CHECKLIST

Data Validation Plan Review Form
Tier I

This Plan Review Form is #	1	of	2	forms completed in the review of this certification report.

Facility Name	Campbell Soup Supply Company	Validator/DO	Kara Reynolds
ID Number	OHD 005 419 171	Date of Plan	Dated May 18, 2004 received by OEPA on May 20, 2004. Subsequent submittals on Maay 25, 2004 and June 1, 2004.
Date Review of Plan Completed		Plan is: New, Amended, Revised	Revised
Document Title:	RCRA Site Closure Revised Certification Report		
Lab Name: Brighton Analytical LLC	Media Type(s): Soil	Analyses Requested: SVOCs, VOCs	Notes:

Note: The criteria used in the Tier I Data Validation checklist are derived mostly from SW-846 methods and U.S. EPA's National Functional Guidelines (NFGs). Criteria from methods are considered preferable as they are specific to that procedure. Where the method is silent, criteria from the NFGs, or other sources when necessary, are adopted. For flashpoint (which uses ASTM methods dictated by the OAC rules), ASTM method criteria are used.

The Tier I data validation manual is the primary reference for this checklist. It explains and gives examples for the questions in this checklist. The Tier II methodology and terminology builds on that established in the Tier I checklist and its associated data validation manual. There is no Tier II manual, only the checklist and completed example checklists. Additional information is also available by referring to the specific methods.

Data Qualifiers and their meanings used throughout the Tier I Checklist	
J	Estimated
J+	Estimated High (results are likely reported higher than the true value)
J-	Estimated Low (results are likely reported lower than the true value)
R	Rejected
UJ	Undetected Estimated
NJ	Tentatively Identified, Quantitation Estimated

Section 1.0
Report Completeness and Technical Holding Times

1.1	Sample Package Completeness and Deliverables	
	Completeness **This section provides a checklist of important components of data reports. If the report is incomplete, it may be necessary to halt data validation procedures until all the missing information is provided. Please, refer to the Tier I data validation manual for additional assistance in completing the checklist.**	
1.1.1	Describe any discrepancies between the Chain Of Custody (COC) record and submitted sampling data. *Action: If there are discrepancies, contact the laboratory for any missing deliverables and/or an explanation.*	No discrepancies exist.
1.1.2	Is a signed statement from the laboratory present that attests to the validity of the data? *Action: Take no further action and contact the facility and have the lab submit a valid data report. If no response, qualify all data as unuseable.*	Yes.
1.1.3	Is a case narrative present that summarizes QA/QC discrepancies and/or other problems? *Action: No action is necessary, but this information is useful to focus data validation efforts.*	Yes. No problems present with the data.
1.1.4	Are COC forms present for all samples? *Action: If not contact the facility for replacement of missing or illegible copies*	Yes. All samples are accounted for.
1.1.5	Do the COC forms, Sample Receipt form, or the Case Narrative indicate any problems with the sample receipt, condition of samples, analytical problems or special circumstances affecting the quality of the data? *Action: Use the information to focus data validation efforts.*	No.
1.1.6	Are Custody Seals present and intact?	No.

1.1	Sample Package Completeness and Deliverables	
1.7	Is a sample receipt form present? If so, does it contain information on condition of sample containers, proper preservatives used (cross-check with COC) and temperature of the cooler? Note any comments or abnormal conditions. Action may be taken for the following special conditions:	No sample receipt form but the COCs and case narrative do not show any problems with the sample containers, preservatives used, or temperature of the cooler.
A.	For samples analyzed for volatiles that were not properly cooled (temperature more than 10°C), all positive results should be qualified as "J" and all non-detects qualified as "UJ."	Cooler temperature was at 4 C.
B.	For all Volatile Organic Compound (VOC) samples or vials with air bubbles (>2 mm), positive results should be qualified as "J" and non-detects as "UJ" or "R" depending on professional judgment (regarding other quality control information such as sample cooler receipt temperature and other site-specific data quality objectives).	No bubbles noted, samples were of soil.
C.	If aqueous samples for VOCs were not preserved, check that technical holding times were met (see Technical Holding Times, Table 1). If not, qualify all associated sample results.	N/A
D.	If liquid TCLP samples were preserved, qualify all associated results as "R."	N/A

Sample ID	Lab ID	Matrix	Sample Date	Date Received by the Lab	Parameter	Extraction Date	Preparation Date	Analysis Date	QA/QC Data Present[A]	Batch ID#

				3/18/2004	SVOCs	3/18/2004	3/19/2004	3/24/2004	Yes	71551

A: Batch specific QA/QC requirements for Tier I data validation for Organic Data consists of Blank Data Matrix Spike/Matrix Spike Duplicate data, and surrogate data. For Inorganic Data the QA/QC data includes a Matrix Spike and it's duplicate and blank data. Additional QA/QC data may include ICP serial dilution results and post-digestion

spike data.

Note: To fill out this table, list one sample ID# then list all sample parameters on one line each with their associated analysis dates, batch ID#s, etc.(*e.g.,* put mercury on a separate line from the other metals since it will have its own prep. dates, analysis dates, and batch ID#s).

1.2 Technical Holding Times

Table 1

Technical Holding Times for Volatile, Semi-Volatile, Metals and pH Samples

Technical holding time is the time, in days, from sample acquisition in the field to either laboratory preparation or analysis. Technical holding times are established from information contained in the laboratory report, chain of custody, and raw analytical bench sheets (if available). Technical holding times also depend upon whether samples were preserved. The recommended technical holding times for volatile compounds, semi-volatile compounds, metals, and TCLP analyses are listed below.

	Preserved	From field collection to extraction	from extraction to preparation	From extraction to analysis	Max Holding Times	Common preservative
VOCs (8260) (aqueous)	Yes	NA	NA	14 days	14 days	Cool to 4° C, HCl
VOCs (8260) (aqueous)	No	NA	NA	7 days	7 days	Cool to 4° C
VOCs (8260) (liquid waste)	No	NA	NA	14 days	14 days	Cool to 4° C
VOCs (8260) (solid/soil/waste)	No	NA	NA	NA	14 days	Cool to 4° C or no preservative
VOCs (EnCore) (5035/8260) (solid/soil/waste)	Yes	2 days	NA	12 days	14 days	Encore Sampler
SVOC(8270)	Yes	7 days	NA	40 days	47 days	Cool to 4° C
Total Metals (6010B/7000)	Yes	NA	NA	180 days	180 days	Nitric Acid (pH<2- aqueous); cool to 4° C - solid samples
Mercury (7470A)	Yes	NA	NA	28 days	28 days	Nitric Acid (pH<2- aqueous); cool to 4° C - solid samples
TCLP VOCs (1311/8260)	No	14 days	NA	14 days	28 days	no preservative
TCLP SVOCs (1311/8270)	No	14 days	7 days	40 days	61 days	no preservative
TCLP Metals (except mercury) (1311/6010B)	No	180 days	NA	180 days	360 days	no preservative

	Preserved	From field collection to extraction	from extraction to preparation	From extraction to analysis	Max Holding Times	Common preservative
TCLP mercury (1311/7470A)	No	28 days	NA	28 days	56 days	no preservative
pH (9040B)	No	24 hours	NA	NA	1 day	no preservative

1.2 Technical Holding Times

Technical Holding Times

Technical holding times are an important component of assuring that data is valid and not biased from inappropriate handling procedures. Technical holding times are judged by examining the length of time from field sampling to extraction and to analysis. There are specific technical holding time requirements for specific classes of compounds. In addition, holding times may vary due to the presence or absence of preservatives. The validator should refer to specific criteria for holding times listed in Table 1 and in the Tier I Data Validation Manual. Use information on sampling, extraction and analysis dates documented in section 1.0 to determine whether technical holding times are in compliance with criteria listed in Table 1. Complete the following table to determine if any violations of technical holding time exist, and qualify all associated sampling data.

1.2 Technical Holding Times - Volatile Organic Compounds	
1.2.1 Are samples properly preserved? Check preservation requirements, chain of custody, and sample receipt form for discrepancies. *Action: Note improprieties and use the information to qualify results.*	List impropriety(-ies): Yes.
1.2.2 If samples were improperly preserved, or unpreserved, and the technical holding times were exceeded, qualify all positive results for affected samples as "J" and all non-detected results as "UJ."	List sample ID(s):N/A
1.2.3 If samples were properly preserved, but technical holding times were exceeded, qualify all positive results for affected samples as "J" and all non-detected results as "UJ."	List sample ID(s):N/A
1.2.4 If technical holding times are greatly exceeded (> 2x the time requirement) upon analysis or re-analysis then the validator may use professional judgement to qualify all non-detected compounds as "R" and all positive results as "J."	List sample ID(s):N/A

1.2 Technical Holding Times - Semi-Volatile Organic Compounds		
1.2.5	If technical holding times are exceeded (Table 1), qualify all positive results for affected samples as "J" and all non-detected results as "UJ."	List sample ID(s):N/A
1.2.6	If technical holding times are greatly exceeded (> 2x the time requirement), the validator may use professional judgement to qualify all non-detected compounds as "R" and all positive results as "J."	List sample ID(s):N/A

1.2 Technical Holding Times - Inorganic Compounds		
1.2.7	Are samples properly preserved (4°C for solids; acid preservation for aqueous samples)? Check preservation requirements, chain of custody, and sample receipt form for discrepancies. *Action: Note any impropriety, and use the information to qualify results.*	List impropriety(-ies):N/A
1.2.8	If samples were improperly preserved and the technical holding times were exceeded (Table 1), qualify all positive results for affected samples as "J" and all non-detected results as "UJ."	List sample ID(s):N/A
1.2.9	If samples were properly preserved, but technical holding times exceeded, qualify all positive results for affected samples as "J" and all non-detected results as "UJ."	List sample ID(s):N/A
1.2.10	If technical holding times are greatly exceeded (> 2x the time requirement), the validator may use professional judgement to qualify all non-detected compounds as "R" and all positive results as "J."	List sample ID(s):N/A

1.2 Technical Holding Times - pH		
1.2.11	If technical holding times are exceeded the validator may use professional judgement to qualify data as "R" or "J."	List sample ID(s):N/A

Section 2.0
VOC Data Validation

2.0 VOC Analysis Data Validation	
2.1 Blank Data Summary Review - Volatile Organic Compounds	
Blank Data **Laboratory blanks are used to assess whether contamination from the laboratory, reagents, or other samples exists and whether this contamination can bias sample results. The qualification of sample results will depend upon the magnitude of blank contamination.**	
2.1.1 Is the method blank summary data present for each batch (method and matrix), including TCLP? *Action: If not present, request information from the facility. If the required method blanks were not analyzed, sample results may be qualified as "J," for positive results and "UJ," for non-detected compounds. Qualification should take into account other QA/QC information.*	Yes.
2.1.2 Is there an indication that the samples associated with that blank were diluted? **Note: The dilution factor can be found in the data report (a dilution factor of 1 indicates no dilution).**	List the dilution factor(s):No dilution
2.1.3 Do any field/trip/rinsate blanks have any positive results for any volatile target analyte? **Note: A list of samples associated with each of the contaminated blanks should be prepared. Field blank results should be used to qualify data. Trip blanks are used to qualify samples based on potential contamination during shipment, and are not required for non-aqueous matrices.** *Action: Follow the directions in the table below to qualify sample results due to contamination. Use the largest value from all of the associated blanks. If any blanks are grossly contaminated, all data associated should be qualified as "R."*	No.
2.1.4 Do any method blanks for VOCs have positive results for any volatile target analytes? Follow the directions in the table below. **Note: When applied, the contaminant concentration in these blanks are multiplied by the same dilution factor and corrected for % moisture if necessary.**	Yes. Toluene. It was re ran and found to be in the blank so the toluene in the samples was determined to be a false positive by the laboratory.

For Common Volatile Contaminants: methylene chloride, acetone, 2-butanone	For Other Contaminants:	Action:
Sample Conc. > Detection Limit but < 10x Blank Result	Sample Conc. > Detection Limit but < 5x Blank Result	Identify the sample result "U" undetected
Sample Conc. < Detection Limit & < 10x Blank Result	Sample Conc. < Detection Limit & < 5x Blank Result	Report the detection limit and qualify result "UJ" estimated undetected
Sample Conc. > Detection Limit & > 10x Blank Result	Sample Conc. > Detection Limit & > 5x Blank Result	No qualification is necessary

2.2 Volatile Organic Data Review - Laboratory Control Sample (LCS)	
Laboratory Control Sample **An LCS should be included with each batch of samples (approximately 20). The LCS consists of an aliquot of a clean (control) matrix similar to the matrix type of the sample and at the same weight or volume. The LCS is spiked with the same analytes at the same concentration as the matrix spike. When the results of the matrix spike indicate a potential problem due to the sample matrix itself, the LCS verifies that the laboratory can perform analyses in a clean matrix (Method 8260B).**	
2.2.1 Was an LCS prepared, extracted, analyzed and reported once per group of 20 samples? **Note: This information should be included in the QA package provided by the lab. If not, contact the laboratory and request that the information be submitted to the agency. This information should be found in the injection log.** *Action: If LCS information cannot be found, consult the facility for re-submittal of the data package. If LCS information is not present, qualify all positive results as "J." If warranted, the Data Validator may reject all results as unacceptable.*	Yes.
2.2.2 Does the LCS contain the following volatile target compounds in addition to the required surrogates: 1,1-Dichloroethene Trichloroethene Chlorobenzene Toluene Benzene **Note: Method 8260B calls for the LCS to be spiked at the same level as the matrix spike. When the results of the matrix spike indicate a problem due to sample matrix, the LCS should be checked to determine whether the laboratory can perform the analysis on a clean matrix.**	N/A
2.2.3 Do the percent recoveries (%R) meet the QC limits provided by the lab? *Action: If the LCS recovery is greater than the upper acceptance limit, then positive sample results for the affected compound(s) should be qualified as "J."* *If the mass spectral criteria are met, but the LCS recovery is less than the lower acceptance limit, then the associated detected target compounds should be qualified as "J," and the associated non-detected target compounds should be qualified as "R."* *If more than half of the compounds in the LCS are not within the recovery criteria, then all of the associated detected target compounds should be qualified as "J," and all associated non-detected compounds should be qualified as "R."*	List compounds and sample IDs that do not meet QC limits: Yes.

2.2 Volatile Organic Data Review - Laboratory Control Sample (LCS)	
2.2.4 Verify the calculations for at least one %R. *%R = found/true X100* *Action: If the %R is not calculated correctly, verify the other %R calculations and/or contact the lab for re-submittal. If the re-calculated %R values fall within the QC limits, the validator should use professional judgement to determine if the lab should be contacted for re-submittal or if the data should be flagged.*	Pg 36. 48/50 * 100 = 96% Done correctly

2.3 Quality Assurance Summary Review - Matrix Spike/Matrix Spike Duplicates, VOC	
Matrix Spike/Matrix Spike Duplicates **Matrix spike and matrix spike duplicates are performed to assess method precision for VOC and SVOC analyses. Matrix spikes and duplicates are required for every batch of samples (every 20 - 30 samples). The validator should be aware that the MS/MSD are batch specific, not sample specific. For example, the MS/MSD information may be any sample in the batch, but not necessarily a sample being validated. Because of this, matrix spike and matrix spike duplicate data alone usually aren't used to qualify results, but the information is used with other QA/QC data to qualify data.**	
2.3.1 Is matrix spike/matrix spike duplicate recovery data present? *Action: If any matrix spike data is missing, the laboratory should be contacted for a re-submittal.*	Yes.
2.3.2 How many VOC spike recoveries are outside the QC limits?	Record the spike recovery and control limits:Zero
2.3.3 How many RPDs for matrix spike and matrix spike duplicate recoveries are outside the QC limits for VOCs? **Note: The MS/MSD results may be used in conjunction with other QC criteria to determine the need for data qualification. Outliers should be identified.**	Record the recovery data out of criteria and control limits. Review surrogate and LCS data to determine if qualifiers are necessary:None.

2.4 VOC Surrogate Recovery

VOC Surrogate Compound Recovery

Surrogate compounds are spiked compounds of known composition that are added to samples and blanks. The recovery of surrogate compounds allows an assessment of matrix interference. VOC surrogate recoveries are used with other QA/QC data to qualify sample results and to justify laboratory re-analysis. Specific examples are listed in the data validation guidance document.

Surrogate Compound	Water [a]	Soil/Sediment [a]
4-Bromofluorobenzene	86-115	74-121
Dibromofluoromethane	86-118	80-120
Toluene-d_8	88-110	81-117
1,2-Dichloroethane-d_4	80-120	80-120

Other Common VOC Surrogates
1,2-Dichlorobenzene-d_4
Pentafluorobenzene
Fluorobenzene

[a] SW-846 Method 8260B, Table 8. Acceptance criteria is guidance.

2.4.1 Are the surrogate recovery data present for each batch (method and matrix), including TCLP? **Note: Samples may be included in separate sample batches and separate surrogate recoveries should be provided.** *Action: If no, contact the laboratory for explanation and re-submittals.*	Yes.
2.4.2 Were any outliers marked correctly (based upon the laboratory's criteria)? *Action: Mark, circle or highlight the suspected outliers.*	List the sample ID(s), matrix(-ces) and parameter(s):Yes.
2.4.3 If any surrogate compound was out of compliance was re-analysis performed to confirm a matrix interference? **Note: Check the report narrative for an indication of re-analysis. Additionally, qualification may not be appropriate for TCLP data. Best professional judgement may be used to qualify data.** *Action: If a surrogate is above the upper control limit, all positive results should be qualified as "J." Results listed as non-detected should not be qualified.* *If any surrogate recovery is less than the lower criteria, but greater than or equal to 10% recovery, all detected compounds should be qualified as "J" and all non-detected compounds as "UJ."* *If any surrogate recovery is less than 10%, all detected compounds should be qualified as "J" and all non-detected compounds as "R."*	List sample ID(s) for surrogate compounds out of compliance and criteria: Yes.

Section 3.0
SVOC Data Validation

3.0 SVOC Analysis Data Validation	
3.1 Blank Data Summary Review - Semi-Volatile Compounds	
Blank Data **Laboratory blanks are used to assess whether contamination from the laboratory, reagents, or other samples exists and whether this contamination can bias sample results. The qualification of sample results will depend upon the magnitude of blank contamination.**	
3.1.1 Is the method blank summary data present for each batch (method and matrix), including TCLP? *Action: If not present, request information from the facility. If information exists that the required method blanks were not analyzed, then sample results may be qualified as "J," for positive results and "UJ" for non-detected compounds. Qualification should take into account other QA/QC information.*	Yes.
3.1.2 Is there an indication that samples, associated with that blank, were diluted? **Note: The dilution factor can be found in the data report (a dilution factor of 1 indicates no dilution).**	List the dilution factor(s):No
3.1.3 Do any field/rinsate blanks have any positive results for any semi-volatile target analyte? **Note: A list of samples associated with each of the contaminated blanks should be prepared. Field blank results should be used to qualify data. Trip blanks are used to qualify only samples based on shipment and are not required for non-aqueous matrices.** *Action: Follow the directions in the table below to qualify sample results due to contamination. Use the largest value from all of the associated blanks. If any blanks are grossly contaminated, all data associated should be qualified as "R."*	No
3.1.4 Do any method blanks for SVOCs have positive results for any semi-volatile target analytes? Follow the directions in the table below. **Note: When applied, the contaminant concentration in these blanks are multiplied by the same dilution factor and corrected for % moisture if necessary.**	No.

For Common Semi-Volatile Contaminants: Phthalate esters	**For Other Contaminants:**	**Action:**
Sample Conc. > Detection Limit but < 10x Blank Result	Sample Conc. > Detection Limit but < 5x Blank Result	Identify the sample result "U" undetected
Sample Conc. < Detection Limit & < 10x Blank Result	Sample Conc. < Detection Limit & < 5x Blank Result	Report the detection limit and qualify result "UJ" estimated undetected
Sample Conc. > Detection Limit & > 10x Blank Result	Sample Conc. > Detection Limit & > 5x Blank Result	No qualification is necessary

3.2 Semi-Volatile Data Review - Laboratory Control Sample (LCS)	
Laboratory Control Sample **An LCS should be included with each batch of samples (approx. 20). The LCS consists of an aliquot of a clean (control) matrix similar to the matrix type of the sample and at the same weight or volume. The LCS is spiked with the same analytes at the same concentration as the matrix spike. When the results of the matrix spike indicate a potential problem due to the sample matrix itself, the LCS verifies that the laboratory can perform analyses in a clean matrix (Method 8270C).**	
3.2.1 Was an LCS prepared, extracted, analyzed and reported once per group of 20 samples (per batch)? **Note: This information should be included in the QA/QC package provided by the lab. If not, contact the laboratory and request that the information be submitted to the agency.** *Action: If LCS information is not present, consult the facility for re-submission of the data package. If LCS information is not available, qualify all positive results as "J." If warranted, the Data Validator may reject all results.*	Yes.
3.2.2 Does the LCS contain the following semi-volatile target compounds in addition to the required surrogates? Base/Neutrals 1,2,4-Trichlorobenzene Acenaphthene 2,4-Dinitrotoluene Pyrene N-Nitroso-di-n-propylamine 1,4-Dichlorobenzene Acids Pentachlorophenol Phenol 2-Chlorophenol 4-Chloro-3-methylphenol 4-Nitrophenol **Note: Method 8270C calls for base/neutral compounds to be spiked at 100 µg/L and acid compounds to be spiked at 200 µg/L. However, for waste samples the concentration should be 5 times higher.**	Yes.
3.2.3 Do the percent recoveries (%R) meet the QC limits provided by the lab? *Action: If the LCS recovery is greater than the upper acceptance limit, then positive sample results for the affected compound(s) should be qualified as "J."* *If the mass spectral criteria are met, but the LCS recovery is less than the lower acceptance limit, then the associated detected target compounds should be qualified as "J," and the associated non-detected target compounds should be qualified as "R."* *If more than half of the compounds in the LCS are not within the recovery criteria, then all of the associated detected target compounds should be qualified as "J," and all associated non-detected compounds should be qualified "R."*	**List compounds and sample IDs that do not meet QC limits:** **Yes.**

3.2 Semi-Volatile Data Review - Laboratory Control Sample (LCS)	
3.2.4 Verify the calculations for at least one %R. *%R = found/true X100* *Action: If the %R is not calculated correctly, verify the other %R calculations and/or contact the lab for re-submission. If the recalculated %R values fall within the QC limits, the Data Validator should use professional judgement to determine if the lab should be contacted for re-submission or the data should be flagged.*	Pg 37 53/50 * 100% = 106% Done Correctly

3.3 Quality Assurance Summary Review - Matrix Spike/Matrix Spike Duplicates, SVOC	
Matrix Spike/Matrix Spike Duplicates **Matrix spike and matrix spike duplicates are performed to assess method precision for VOC and SVOC analyses. Matrix spikes and duplicates are required for every batch of samples (every 20 - 30 samples). The validator should be aware that the MS/MSD are batch specific, not sample specific. For example, the MS/MSD information may be any sample in the batch, but not necessarily a sample being validated. Because of this, matrix spike and matrix spike duplicate data alone usually aren't used to qualify results, but the information is used with other QA/QC data to qualify data.**	
3.3.1 Is matrix spike/matrix spike duplicate recovery data present? *Action: If any matrix spike data is missing, the laboratory should be contacted for a re-submittal.*	Yes.
3.3.2 How many SVOC spike recoveries are outside the QC limits?	Record the spike recovery and control limits:Zero.
3.3.3 How many RPDs for matrix spike and matrix spike duplicate recoveries are outside the QC limits for SVOCs? **Note: The MS/MSD results may be used in conjunction with other QC criteria to determine the need for data qualification. Outliers should be identified.**	Record the recovery data out of criteria and control limits. Review surrogate and LCS data to determine if qualifiers are necessary:None

3.4 SVOC Surrogate Recovery	
SVOC Surrogate Compound Recovery **Surrogate compounds are spiked compounds of known composition that are added to samples and blanks. The recovery of surrogate compounds allows an assessment of matrix interference. SVOC analyses include compounds that can be divided into two classes: acid compounds and base/neutral compounds. Each class has a specific assigned set of surrogate compounds. The list of compounds can be found in the data validation guidance manual or SW-846, Method 8270. Data validation is also based upon the type of compound being analyzed. SVOC surrogate recoveries also are used to justify re-analysis to confirm matrix interference, but the number of surrogate compounds out of compliance will justify qualification. Specific examples are listed in the data validation guidance document.** **Surrogate Compound** — **Fraction** **phenol-d_6** — **Acid** **2-fluorophenol** — **Acid** **2,4,6-tribromophenol** — **Acid** **nitrobenzene-d_5** — **Base/Neutral** **2-fluorobiphenyl** — **Base/Neutral** **p-terphenyl-d_{14}** — **Base/Neutral**	
3.4.1 Are the surrogate recovery data present for each batch (method and matrix), including TCLP? **Note: Samples may be included in separate sample batches and separate surrogate recoveries should be provided.** *Action: If no, contact the laboratory for explanation and re-submittals.*	Yes.
3.4.2 Were any outliers marked correctly? *Action: Mark, circle or highlight the suspected outliers.*	List the sample ID(s), matrix(-ces) and parameter(s):Yes.
3.4.3 If any TWO surrogate compounds in either the acid or base/neutral classes were out of compliance, was re-analysis performed to confirm a matrix interference? **Note: Check the report narrative for an indication of re-analysis.** *Action: If no information is present, request information from the facility.*	List sample ID(s) for surrogate compounds out of compliance and criteria: Yes. They were re ran example vial 8124.
3.4.4 If any ONE surrogate compound has a recovery of less than 10% in either the acid or base/neutral classes, check for indications that re-analysis was performed to confirm a matrix interference? **Note: Check the report narrative for an indication of re-analysis.**	List sample ID(s) for surrogate compounds out of compliance and criteria:Yes.

3.4 SVOC Surrogate Recovery	
3.4.5 Based on the findings, qualify data in either the acid or base/neutral classes with the following criteria: **Note: Qualification may not be appropriate for TCLP data. Best professional judgement may be used to qualify data.** *Action: If TWO surrogates in a particular class are above the upper control limit, all positive results, for that fraction, in that class should be qualified as "J." Results listed as non-detected should not be qualified.* *If any TWO surrogates in a particular class have recoveries less than the lower criteria, but the recovery is greater than or equal to 10%, all detected compounds, for that fraction, should be qualified as "J" and all non-detected compounds as "UJ."* *If any surrogates in a particular class have recoveries less than 10%, all detected compounds, for that fraction, should be qualified as "J" and all non-detected compounds as "R."*	List the ID(s) of the affected sample(s):No qualification necessary. The samples were re analyzed correctly.

Section 4.0
Metals Data Validation

4.0 Metals Analysis Data Validation	
4.1 Blank Data Summary Review - Metals Data	
Blank Data **Laboratory blanks are used to assess whether contamination from the laboratory, reagents, or other samples exists and whether this contamination can bias sample results. The qualification of sample results will depend upon the magnitude of blank contamination.**	
4.1.1 Is the method/prep blank summary data present for each batch (method and matrix), including TCLP? *Action: If not present, request information from the facility. If the required method blanks were not analyzed, sample results may be qualified as "J" for positive results and "UJ" for non-detected compounds. Qualification should take into account other QA/QC information.*	Metals not analyzed/
4.1.2 If metals are detected in the blank, record the IDs of the affected samples and those metals detected above the detection limit in the blank and all positive results from the samples. Attach this summary page to this checklist. *Action: Positive sample results that are greater than the detection limit but less than 5 X the blank results should be qualified as "UJ." If the blank is severely contaminated, the corresponding positive sampling results may be qualified as "R."*	N/A
Blanks- Mercury	
4.1.3 Was a Method blank included per batch and were the results below the reporting limit or the CRDL (for CLP labs)?	N/A
4.1.4 Did any Method Blanks contain concentrations of mercury above reportable levels? Were these flagged? **Note: If mercury is discovered in the method blank above the reporting limit, the lowest concentration of any sample in that batch must be 10 times the method blank concentration. If this is not the case, all samples in that batch should have been re-digested and re-analyzed.** *Action: Review the blank data. If the sample results are positive but less than 5 times the concentration in the blank, the results should be qualified as "U".* *If the sample results are positive and greater than 5 times the blank concentration, but less than 10 times the blank concentration, the results should be qualified as "J".*	N/A

4.2 Metal Spike Recovery	
Metal Spike Recovery **Spikes are elements of known composition that are added to blanks and to samples that measure accuracy and precision of the analyses. At least one spike (termed a matrix spike or prep spike) should be included for each batch of samples. Spike recovery criteria listed in this section are determined from U.S. EPA's National Functional Guidelines for Inorganic Data Review. The criteria applied by an individual laboratory may vary. The laboratory should be consulted and it's QA/QC criteria supplied to the validator.**	
4.2.1 Confirm that at least one pre-digestion spiked sample was analyzed per batch, matrix type and concentration or sample delivery group? *Action: If not present, contact the facility for re-submittal.*	N/A
4.2.2 Are all spike recoveries (except Hg and Ag) within control limits (e.g., 75% to 125%)? **Note: When the spike sample result is less than the instrument detection limit, the percent recovery calculation should use a value of zero (not the detection limit) for the sample result.** *Action: Is the sample concentration ≥ 4 times the spiked concentration? If yes, disregard spike recoveries for analytes whose concentrations in samples are > 4 times the spike added. If no, circle those analytes whose concentration is < 4 times the spike added.*	List those elements out of control:N/A
4.2.3 Based on the results of 4.2.2, if the sample results were <4x the spike amount and spike recoveries were out of criteria, a post-digestion spike should be analyzed. **Note: Post-digestion spikes are not required for Ag or Hg, however, one typically is run if the LCS was out of control. The post digestion spike confirms a matrix interference and should not be used for qualification** *Action: Contact the facility/laboratory for an explanation if a post-digestion spike was not analyzed. If none are available, use professional judgement to qualify sample results.*	N/A
4.2.4 Were concentrations in the digestate reported in ug/L for aqueous samples and mg/kg on the basis of dry weight for soil samples?	N/A

4.2 Metal Spike Recovery	
4.2.5 Are any **aqueous** spike recoveries (pre and post digestion): 1. Less than 30%? 2. Between 30% and 74%? 3. Between 126% and 150%? 4. Greater than 150%? **Note: The TCLP extract should be handled as an aqueous sample.** *Action: If < 30%, and the sample results are below the detection limit, all data should be qualified as "R."* *If between 30% and 74%, qualify all positive data as "J" and non-detected data as "UJ."* *If between 126% and 150%, qualify positive as "J." All undetected compounds are acceptable.* *If > 150% note for possible positive bias. Evaluator may qualify data "R" based on professional judgement and the eventual end use of the data.*	N/A
4.2.6 Are any **soil/solid/waste** spike recoveries (pre and post digestion): 1. Less than 10%? 2. Between 10% and 74%? 3. Between 126% and 200%? 4. Greater than 200%? *Action: If < 10%, those elements out of control limits should be qualified as "R."* *If between 10% and 74%, qualify those elements out of control limits as "J."* *If between 126% and 200%, qualify positive data, for those elements out of control limits, as "J."* *If > 200%, qualify all positive data, for those elements out of control limits, as "R."*	N/A
4.2.7 If the pre-digestion spike was outside the QC limits for **Atomic Adsorption furnace analysis** (e.g., SW-846 methods in the 7000 series), was a post-digestion spike performed? *Action: Samples should not be qualified based on post-digestion spike results. The results are used to confirm a matrix interference. If a post-digestion spike was not prepared, the data validator may reject the data.*	N/A
4.2.8 Based on the results from 4.2.7, were the post-digestion spike recoveries within the quality control range (75% to 125%)? *Action: If > 125%, qualify all positive data as "J." If < 75%, qualify both positive and non-detect data as "J."*	N/A

4.3 Quality Assurance Data Review - Inorganic Analysis - AA Analysis	
Graphite Furnace Atomic Adsorption QC Atomic Adsorption analyses require specialized QA/QC procedures that may be different than Inductively Coupled Plasma (ICP) Emission Analysis. Commonly, AA analysis is performed for mercury and selenium. Mercury analysis data validation is specifically detailed in the Inorganics Section of the Tier II Checklist. The Tier I Data Validator is directed to the Agency's Data Validation Review Manual and to specific methods detailed in SW-846. In general, external calibration procedures are commonly required by the method. In addition, duplicate injections and multiple concentration post-digestion spikes are required to establish precision and accuracy data.	
4.3.1 Were duplicate injection of samples performed and if so, were the duplicates within ± 20% RPD for samples with concentrations above the detection limit? **Note: Results are reported based upon the average of duplicate injections. If the acceptance criteria is not met, the sample should have been re-analyzed (i.e., with at least two additional injections).** *Action: If RSD criteria is not met or the sample was not rerun, qualify all positive data as "J."*	List sample IDs and appropriate method and calculated RPD: **N/A**
4.3.2 If the samples were re-analyzed (*i.e.*, 2 more injections), do the duplicate injections agree within 20% RSD? *Action: If the RSD criteria is not met, qualify all positive results as "J."*	No. _____N/A_ N/A Yes. _____. List sample IDs and appropriate method and calculated RSD.
4.3.3 Were Matrix Spike/Matrix Spike Duplicates analyzed at a rate of 1 in 20 or per batch? *Action: If no MS/MSD were analyzed, qualify all positive results as "J" and all undetected results as "UJ."*	N/A

4.4 Spikes - Mercury Analysis	
4.4.1 Was a Matrix Spike analyzed at required frequency (one pre-digestion for each group of samples with a similar matrix type and concentration or sample delivery group) and within limits? **Note: Post-digestion spikes are not required for Mercury. However one typically is run if the LCS was out of control in order to show matrix interference.** *Action: If the spike recovery is greater than 125 % and the sample results are below the detection limit, the data is acceptable.* *If the spike recovery is greater than 125% or less than 75%, and the sample results are greater than the detection limit, then the positive data should be qualified as "J."* *If the spike recovery falls within the range of 30 to 74%, all non-detected data should be qualified as "UJ."* *If the spike recovery is less than 30% and the sample results are below the detection limit, qualify these results as "R."*	**N/A**

4.4.2 If the analyte concentration in the original sample is a factor of 50 above the IDL, was a serial dilution analysis performed and did it agree within a 10% difference of the original determination after correction for dilution?	N/A
4.4.3 Was an LCS analyzed per batch and within QC limits (80 to 120%)? (An LCS is not required for aqueous samples of Mercury.) **Note: The results for solid LCS should always be within the control limits. The laboratory should terminate the analysis, correct the problem, and the samples should be re-digested and re-analyzed for mercury.** *Action: If the LCS is outside of the control limit, qualify all positive results as "J."* *If the LCS results are higher than control limits and the sample results are below the detection limit, the results are acceptable.* *If the LCS result is below the lower control limit, qualify all results below the detection limit as "UJ."*	N/A

Section 5.0
Characteristic Tests

5.1 TCLP Preparation and TCLP Spike Recovery	
Toxicity Characteristic Leaching Procedure **The toxicity characteristic leaching procedure (TCLP) is used to determine whether wastes exhibit the toxicity characteristic or whether Land Disposal Restrictions have been met. The TCLP test is specified in OAC 3745-51-24 and defined in SW-846, Method 1311. TCLP data validation requires specific data concerning extraction preparation in addition to the usual data submitted for organic and inorganic analytical methods. In most cases, a laboratory will have to supply bench sheet data to complete data validation. The validator should consult the Tier I Data Validation Guidance Manual for specific information and examples.**	
5.1.1 Did the laboratory calculate TCLP filterable solids? Based on the percent solid calculations, were the correct analytical procedures followed? **Note: TCLP requires that solid waste, semi-solid waste and liquid wastes be prepared based upon the amount of solids in the waste. For waste that has greater than 99.5% solids, the waste is considered solid and a 100 grams of material is extracted with 20 times this weight of extraction fluid. For waste that is equal to or less than 0.5% solids, the waste is considered a liquid and the liquid itself is considered the extract (no additional extraction fluid or tumbling is necessary). If the waste contains both solids and liquids, the solid portion, trapped by filtering, is extracted with 20 times it's weight of extraction fluid and then analyzed. In addition, an aliquot of the liquid is analyzed. The results are then mathematically combined.** *Action: If percent solids were not calculated contact the facility for the proper information.* *If, based on the percent solids calculations, the appropriate preparation methods were not used, qualify analytical results using the following criteria:* *All positive results above the regulatory level should not be qualified.* *All positive results above the detection limits but below the regulatory level should be qualified based on professional judgement and the specific circumstances. You may want to speak with your Tier II validator.* *All non-detected results should be qualified based on professional judgement and the specific circumstances.*	Not analyzed.

5.1 TCLP Preparation and TCLP Spike Recovery	
5.1.2 Was the proper amount of material extracted? **Note: For waste samples to be analyzed for metals or SVOCs (in the solid portion), a minimum of 100 grams is required. For waste samples to be analyzed for volatile compounds, approximately 20-25 grams of sample is required.** **Note: Liquid samples are directly analyzed as the TCLP extract, no extraction fluid is added to the sample.** *Action: If improper sample mass is used, qualify analytical results using the following criteria:* *All positive results above the regulatory level should not be qualified.* *All positive results above the detection limits, but below the regulatory level should initially be qualified as "J" estimated. Based on professional judgement, qualification of data as "R" may be warranted.* *Based on professional judgement, all non-detected results should be qualified as "J" estimated or "R."*	List sample IDs and sample mass(es) used for the extraction: N/A
5.1.3 Was the correct extraction fluid used? **Notes:** **Fluid # 1 is always used for VOC analysis.** **Fluid #1 should be used if the final pH of the pre-test sample is below 5.0.** **If the pH is above 5.0, hydrochloric acid should be added to the pre-test sample (refer to the method for specifics).** **Re-analyze for pH.** **Fluid #1 should be used if the final pH of the pre-test sample is below 5.0.** **Fluid #2 should be used if the final pH of the pre-test is above 5.0.** *Action: Consult with the facility and have the extraction fluid information submitted. If the improper fluid is used, qualify analytical results using the following criteria:* *All positive results above the regulatory level should not be qualified.* *All positive results above the detection limits, but below the regulatory level, should initially be qualified as "J." Rejection of data may be warranted if other preparatory procedures are outside of criteria.* *All non-detected results should be qualified as "R."*	List sample IDs and fluid type(s) used for the extraction: N/A

5.1 TCLP Preparation and TCLP Spike Recovery	
5.1.4 Did the extraction fluid have the proper pH? Fluid #1 has a pH range of 4.88 to 4.98 Fluid #2 has a pH range of 2.83 to 2.93. *Action: If an improperly prepared extraction fluid is used, qualify analytical results using the following criteria:* *All positive results above the regulatory level should not be qualified.* *All positive results above the detection limits, but below the regulatory level, should initially be qualified as "J." Rejection of data may be warranted if other preparatory procedures are outside of criteria.* *All negative results should be qualified as "R."*	List incorrect fluid pH(s): N/A
5.1.5 Was the correct weight of extraction fluid used? Laboratory bench sheets may be needed to complete this section. **Note: For waste that has greater than 99.5% solids, the waste is considered solid, and 100 grams of material are extracted with fluid 20 times this weight. For waste that is equal to or less than 0.5% solids, the waste is considered a liquid, and the liquid itself is considered the extract (no additional extraction fluid or tumbling is necessary). If the waste contains both solids and liquids, the solid portion, trapped by filtering, is extracted with fluid 20 times its weight. This extract can either be physically recombined with the liquid portion for analysis, or the estract and liquid portions can be analyzed separately and those results conbined mathematically.** *Action: The extraction fluid weight should be within 85 - 115% of the correct value (2000 grams for metals; 500 grams for VOCs). These values may be re-qualified if additional problems with TCLP preparation exist.* *If the extraction fluid weight is within 70 - 85% or 115 - 130% of the correct value, qualify all results as "J."* *If the extraction fluid weight is 0 - 70% of the proper weight, qualify all results as "R."* *If the extraction fluid weight is greater than 130% of the proper weight, qualify all non-detected compounds, and positive results below the regulatory level, as "R." All positive results above the regulatory limit should not be qualified.*	N/A

5.1 TCLP Preparation and TCLP Spike Recovery	
5.1.6 Was a TCLP blank analyzed with every batch of samples? **Note: TCLP blanks should be prepared using the same extraction fluid as is used for the associated sample's extraction.** *Action: Contact the facility for submittal of missing data. If no blank was analyzed, qualify all positive results as "R." If data is available, qualify TCLP data as designated in Section 4.0 Blank Data Summary Review*	List IDs of affected samples: N/A
5.1.7 Was the tumbling time within 18 +/- 2 hours? **Note: Tumbling time (evaluated based on the day and time tumbling begins/is completed) should be noted on the bench sheets. The laboratory should be contacted if this information isn't present.** *Action: If the tumbling time is not within 18 +/- 2 hours, qualify all data as "J."*	N/A
5.1.8 Was the tumbler speed within 30 +/-2 RPM? **Note: Tumbler speed should be noted on the bench sheets. The laboratory should be contacted if this information isn't present.** *Action: If the tumbler speed is not within 30 +/-2 RPM, qualify all data as "J."*	N/A

VOC, SVOC and Metal results from the TCLP test should meet the sample QA/QC criteria outlined in Sections 1.0 through 4.0.

5.2 Ignitability
Ignitability The two testing methods that may be used to determine this hazardous waste characteristic are SW-846 Method 1010 (Pensky Martens Closed Cup, also ASTM D93-80 or D93-71) and Method 1020 (SETAFlash Closed Cup and ASTM D3278-91). Method 1020A is used for liquids that have lower viscosities and flashpoints between 0 °C and 110 °C. Method 1010 is the flashpoint method most often used by DHAM. It is used for "fuel oils, lube oils, suspensions of solids, liquids that tend to form a surface film under test conditions, and other liquids." For us, this includes things like paint wastes, parts cleaners, etc. To test the flash point, "the sample is heated at a slow, constant rate with continual stirring. A small flame is directed into the cup at regular intervals with simultaneous interruption of stirring. The flash point is the lowest temperature at which application of the test flame causes the vapor above the sample to ignite." Method 1010 has two options, termed "A" and "B". Method A, the basic procedure, is used unless the material being tested is a suspension of solids or a highly viscous material. Those materials require the use of Method B. There are specific requirements and apparatus for method 1010 that are not included in this check list. These items include recording of barometric pressure, thermometers, stirrer rates, wind shields and drying of wastes that contain free water. If necessary, specific testing requirements that are used should be discussed with the laboratory and appropriate qualifications of the data should be made.

5.2 Pensky-Martens (SW-846, Method 1010) - Method A		
5.2.1	Was p-xylene used to calibrate the instrument?	Not analyzed.
5.2.2	Was the flashpoint for the calibration standard p-xylene within 81± 6 °F?	Record the p-xylene calibration flashpoint(s):N/A
5.2.3	If the calibration standard was outside of this range (see 6.1.2), was corrective action taken? *Action: If no corrective measures were performed, determine whether a significant bias has been imparted to the samples and qualify the results using professional judgement. If sample is still available, notify the laboratory. Consult Tier II evaluator regarding request re-analysis.*	Record IDs of samples that are qualified:N/A
5.2.4	Based on 6.1.3, if corrective measures were taken, was the p-xylene calibration flashpoint within 81± 2 °F? **Note: Corrective measures should have continued until this flashpoint calibration range was attained.** *Action: If these procedures were not followed and documented, contact the laboratory for an explanation. Lack of an adequate explanation may justify qualifying the data.*	N/A
5.2.5	If a sample has an expected flashpoint, based on field/facility information, measurements should begin at least 30-50° F below the expected flashpoint of the material. If the expected flashpoint is unknown, the initial measurements should begin at the ambient temperature of the laboratory. *Action: If these procedures were not followed and documented, contact the laboratory for an explanation. Lack of an adequate explanation may justify qualifying the data.*	N/A

5.2 Pensky-Martens (SW-846, Method 1010) - Method A	
5.2.6 Was heat applied so as to raise the temperature of the sample at a rate of 9-11 °F per minute? **Note: To determine if this temperature rate is proper, the time and temperature at the beginning of heating should be recorded, and the time and temperature when flash occurred (or when analyses ended) should be recorded.** *Action: If these procedures were not followed and documented, contact the laboratory for an explanation. Lack of an adequate explanation may justify qualifying the data.*	N/A
5.2.7 Were duplicate analyses performed? *Action: If no duplicates exist, the data validator may qualify all results as "J." If additional QA problems exist the validator may justify rejecting the results if the flashpoint determination is over 140°F. Results should not be rejected for data under 140°F.* *If duplicate results exist, and the flashpoint range is under 220°F, the results should agree within ± 4°F. If the results do not agree then qualify all results as "J." If additional QA problems exist, the validator may justify rejecting the results if the flashpoint determination is over 140°F. Results should not be rejected for data under 140°F.*	N/A

5.3 Pensky-Martens (SW-846Method 1010) - Method B for Viscous Materials	
5.3.1 Was p-xylene used to calibrate the instrument?	N/A
5.3.2 Was the flashpoint for the calibration standard p-xylene within 81± 6 °F?	Record the p-xylene calibration flashpoint: N/A
5.3.3 If the calibration standard was outside of this range (see 6.2.2), was corrective action taken? *Action: If no corrective measures were performed, determine whether a significant bias has been imparted to the samples and qualify the results using professional judgement. If sample is still available, notify the laboratory and request re-analysis.*	Record IDs of samples that are qualified: N/A
5.3.4 If corrective measures were taken, was the p-xylene calibration flashpoint within 81± 2 °F? **Note: Corrective measures should have continued until the correct calibration flashpoint was attained.** *Action: If these procedures were not followed and documented, contact the laboratory for an explanation. Lack of an adequate explanation may justify qualifying data.*	N/A

5.3 Pensky-Martens (SW-846Method 1010) - Method B for Viscous Materials	
5.3.5 Measurements should begin at 30-50°F below the expected flashpoint of the material. If that is unknown, the initial temperature should be the ambient temperature of the laboratory. *Action: If these procedures were not followed and documented, contact the laboratory for an explanation. Lack of an adequate explanation may justify qualifying the data.*	N/A
5.3.6 Was the temperature of the sample raised at 2-3 °F per minute? **Note: Laboratory bench sheets may be required to show the starting temperature, the starting time, the flash point temperature and the time when flash occurred. These materials should be requested from the laboratory.** *Action: If these procedures were not followed and documented, contact the laboratory for an explanation. Lack of an adequate explanation may justify qualifying the data.*	N/A
5.3.7 The flashpoint temperature should be corrected for the ambient barometric pressure, using the following relationships: 1) Corrected flashpoint = C + 0.25(101.3 - p) 2) Corrected flashpoint = F + 0.06(760 - P) 3) Corrected flashpoint = C + 0.033(760 - P) Where: F = Observed flashpoint, °F C = Observed flashpoint, °C P = Ambient barometric pressure, mm Hg p = Ambient barometric pressure, kPa. **Note: The ambient barometric pressure should not be corrected to give sea level readings. The ambient barometric pressure is the ambient pressure in the laboratory at the time of the test. Many barometers that are used at weather stations are corrected to give sea level readings.** *Action: If flashpoint was not corrected for ambient barometric pressure, qualify all results over 140°F as "J" estimated. If additional QA results indicate a lack of quality, any results above 140°F may be qualified as "R." Flashpoint results less than 140°F should not be qualified.*	Record IDs of samples where flashpoint was not corrected: N/A

5.3 Pensky-Martens (SW-846Method 1010) - Method B for Viscous Materials	
5.3.8 Were duplicate analyses performed? **Note: If no duplicate data exists consult with the facility and obtain the laboratory results.** *Action: If duplicate data does not exist, qualify all results as "J." If additional QA problems exist, the validator may justify rejecting the results if the flashpoint determination is over 140°F. Results should not be rejected for data under 140°F.* *If duplicate results exist, and the flashpoint range is under 220°F, the results should agree within ± 4°F. If the results do not agree, qualify all results as "J." If additional QA problems exist the validator may justify rejecting the results if the flashpoint determination is over 140°F. Results should not be rejected for data under 140°F.*	N/A

5.4 pH Determination and Corrosivity Tests	
pH **pH is an important parameter used in ambient groundwater monitoring and for determining if a waste displays the characteristic of corrosivity. For corrosivity determinations, OAC 3745-51-22 specifies that SW-846 Method 9040B be used as the analytical test.**	
5.4.1 Were the pH tests performed as soon as practically possible? **Note: SW-846 Method 9040B does not specify a maximum technical holding time for pH. However, it does state that all tests must be performed as soon as possible. The Ohio EPA expects that most laboratories can perform the pH test within 24 hours of sample receipt.** *Action: If analyses were performed within 24 hours, no action is necessary. If analyses were performed after 24 hours, but before the end of 7 days after sample receipt, all sample results between a pH of 2.05 and 12.5 will be flagged as "J." If the results are equal to or less than a pH of 2 or greater than or equal to a pH of 12.5, the results will not be flagged.* *If analyses were performed 7 days or more after sample receipt, all sample results between a pH of 2.05 and 12.45 will be flagged as "R." If the results are equal to or less than a pH of 2 or greater than or equal to a pH of 12.5, the results will not be flagged.*	Note time and date of sampling, sample receipt, and analysis for each sample. N/A
5.4.2 Was a yearly NIST certification of the analytical instrument performed? **Note: This information must be part of the Laboratory's QAPP. Check the QAPP or request information for the facility or laboratory.** *Action: If a yearly certification was not performed, flag all results between a pH of 2.05 and 12.5 as "J." All results meeting the regulatory criteria for corrosivity will not be flagged.*	N/A

5.4.3 Were the calibration buffers within their expiration date? **Note: Have the laboratory provide a photocopy of the expiration date, and the buffer batch ID?** *Action: If the expiration date is exceeded, flag all results between pH 2.05 or 12.45 as "R." Initially, results meeting the regulatory criteria for corrosivity will not be flagged; however, the data validator may qualify results based upon professional judgement and the data quality objectives for the data.*	N/A
5.4.4 Was the instrument calibrated correctly using at least two buffers that bracket the expected pH of the sample? **Note: For corrosivity determinations, the calibration buffers must include a pH 2 buffer and a pH 12 buffer. Review the calibration log for information or request information from the laboratory.** *Action: If an insufficient number of buffers were used (i.e., one) or if incorrect buffers were used (buffers did not include a pH of 2 or 12 for corrosivity determinations), flag all results between a pH of 2.05 and 12.45 as estimated, "J." All results meeting the regulatory criteria for corrosivity will not be flagged. If the pH of the waste is within 1.5 pH units of the regulatory criteria for corrosivity (3.0 or 11.0) and a pH 2 or 12 buffer was not used, the results may be questionable and additional analyses using the correct buffers standards may be necessary.*	N/A
5.4.5 Was continuing calibration performed? **Note: If continuing calibration was performed, the pH of the continuing calibration buffer must be within 0.5 pH units of the buffer pH. Information on the continuing calibration standard and results must be requested from the laboratory.** *Action: If continuing calibration was performed and the results were within 0.5 pH of the calibration buffer, no action is necessary. If continuing calibration was performed, and the results were greater or less than 0.5 pH units of the correct reading for the calibration buffer, then the analysis must have been terminated and the instrument recalibrated. If recalibration was necessary, but not performed, flag all results between a pH of 2.05 and 12.5 as estimated, "J." Initially, results meeting the regulatory criteria for corrosivity will not be flagged; however, the data validator may qualify results based upon professional judgement and the data quality objectives for the data.*	N/A

5.4.6 Were the temperatures of the sample and the calibration buffers within 2°C of each other? **Note: request the information from the laboratory. If the sample and the calibration buffers were not within 2°C, then temperature compensation must have been performed. Request information from the laboratory on manual temperature compensation procedures or whether an automatic temperature compensation was used.** *Action: If temperature compensation was required but not performed, flag all results between pH 2.05 or 12.45 as estimated, "J." Initially, results meeting the regulatory criteria for corrosivity will not be flagged; however, the data validator may qualify results based upon professional judgement and the data quality objectives for the data.*	N/A
5.4.7 If the sample pH was above 12.0, was the temperature of the sample maintained at 25 ±1°C? *Action: If the temperature was maintained at 25 ±1°C, then no action is necessary. If the temperature was not maintained at 25 ±1°C, but the results meet the regulatory criteria of corrosivity, then the results will not be flagged. If the temperature was not maintained, then reject, "R," all results between 12.0 and 12.5.*	N/A

Henry Co
"Campbell Soup Company 2004"

Closure Certification Review Form

Facility Name	Campbell Soup Supply Company	Reviewer/District Office	Kara Reynolds/NWDO
ID Number	OHD 005 419 171	Date of Certification	Certification dated May 18, 2004. Received by OEPA on May 20, 2004. Subsequent submittals on May 25, 2004 and June 1, 2004.
Date Review of Certification Completed	June 9, 2004	Certification is: New, Amended, Revised	Revised
Date Reviewed by Closure Coordinator		Date Reviewed by DDAGW, if Applicable	N/A

I. General Information		Location in Certification
A) Facility Permit Status (Part A, Part B, Unpermitted TSDF):	Unpermitted	
B) Is this a (Partial/Full) Closure?	Full	
If Partial Closure is checked, list the other regulated units remaining (unclosed) at the facility. This does not include generator units.		
C) Does the submitted certification describe closure for more than one unit? If so, a separate certification review form should be completed for each individual unit.	No	

II. General Considerations	
A) Date of the closure certification inspection	June 9, 2004
B) Was the certification submitted, by registered mail, within 60 days of completion of closure, in accordance with OAC Rule 3745-55-15 or 3745-66-15?	Yes
C) Has the closure performance standard (OAC Rule 3745-55-11 or 3745-66-11) been met? Describe how the closure performance standard was met (e.g., the facility has shown that the remaining concentrations of the constituents of concern (COCs) have passed a human health risk assessment and do not show a need for further maintenance).	Yes. The facility has shown that the remaining concentrations of COCs have passed a risk assessment via GCNs and do not show a need for further maintenance.
D) Professional Engineer (PE) Requirements: Is the PE licensed to practice in the state of Ohio, as can be verified using their name or PE license number at www.ohiopeps.org? Is the PE not directly employed by the owner/operator corporation or any of the corporations subsidiaries? Is the PE qualified, demonstrating education and/or experience in environmental and waste management areas?	Yes Yes. The PE is not directly employed by the owner/operator corporation or any of the corporation subsidiaries. Yes
E) Was the frequency of inspection by the PE sufficient to determine the adequacy of each critical activity? The independent registered professional engineer or his/her representative should have been present for all critical activities during closure, including but not limited to soil sampling, soil removal, backfilling, final cover placement, structure decontamination, etc.	Yes. Either the PE or the representative were at all closure activities.

II. General Considerations	
F) What is the status of the facility upon completion of closure (CESQG, SQG, LQG, TSDF, land disposal facility, no longer a generator of hazardous waste)?	CESQG
G) If contaminated soil is left in place, is it protected by an alternate technology cover (cap)?	No contaminated soil in place.
H) If waste remains in place, is it protected by engineering controls?	No waste remains in place.
I) Is there an approved post-closure plan, which includes post-closure monitoring, operations and maintenance, and financial assurance, if applicable (OAC Rule 3745-55-18 or 3745-66-18)?	No post-closure plan needed.

III. Documentation to be Included with Certification		Location in Certification
A) Is there a statement attesting to the fact that the unit or facility has been closed in accordance with the specifications in the approved closure plan (OAC Rule 3745-55-15 or 3745-66-15)?	Yes.	Pg. 1
B) Does the certification contain the exact wording as found in OAC Rule 3745-50-42(D)?	Yes.	Page 3 of the cover letter, 35
C) Is the certification statement signed by the owner/operator and an independent registered PE licensed to practice in the state of Ohio?	Yes.	Page 3 of the cover letter, 35
D) Is the approved closure plan or reference to the approved closure plan included?	**Yes, reference to plan made.**	**Pg. 1**
Is there a summation of minor changes to the plan approved by Ohio EPA, as well as significant correspondence regarding these minor changes?	**Yes.**	**Appendix A**
Does the certification report include all correspondence (from the facility to Ohio EPA and from Ohio EPA to the facility) regarding all closure activities after Ohio EPA approval?	**Yes.**	**Appendix A**
E) Is there a narrative describing all significant activities during closure, including but not limited to sampling, decontamination, cover (cap) construction, and ground water well construction?	Yes.	**Pg. 3-34**
F) Is the volume of waste removed or closed in place, including the volume of waste generated by closure activities such as decontamination, stated in the certification?	Yes.	**Table 5**
G) For waste removed or generated, is documentation included that details proper characterization of the waste (sampling data) and proper management to off-site facilities (copies of manifests)?	**Yes.**	**Appendix A, D, E**
H) Are the results of all media sampling and analytical activities, including raw laboratory data and enough quality assurance and quality control information that the applicable Data Validation/Data Collection plan review forms can be completely filled out, included? Does the certification include chains of custody?	**Yes.**	**Attachments I, II and Appendix B**

III. Documentation to be Included with Certification		Location in Certification
I) Is there documentation that cleanup standards defined in the approved closure plan have been achieved and that the closure performance standard has been met? This may include documentation that any applicable institutional controls have been implemented.	**Yes. There is a table that shows the risk calculation below the appropriate levels.**	**Table 11**
J) Are as-built drawings for waste-in place closures included?	**N/A**	
K) If the unit is subject to post-closure care and monitoring, then is there proof of submission of a survey plat to the local zoning authority (OAC Rule 3745-55-16 or 3745-66-16)?	**N/A**	
L) Are boring logs and ground water well construction or abandonment details included?	**No. This information is contained in the closure plan.**	
M) If a use restriction or deed notice is necessary, has it been implemented using a method approved by Ohio EPA Legal? Note: a deed notice is a requirement for waste-in place closure units in accordance with OAC Rules 3745-55-19 and 3745-66-19.	**N/A**	
N) Is any other information which is needed to document compliance with the approved closure plan and the closure performance standard included?	**All information needed has been included in the certification report.**

Re: Former Holding Pit
Revised RCRA Site Closure Report
Campbell Soup Supply Company, Napoleon, Ohio
OHD 005 419 171

Dear Ms. Reynolds:

Enclosed please find a copy of a "Revised RCRA Site Closure Report" prepared by GeoTrans, Inc., an independent registered professional engineer, certifying that the facility has been closed in accordance with the specifications in the approved Closure Plan and the Revised Sampling Plan that was approved in your letter of March 5, 2004. This QA/QC information for the analytical results of the Revised Sampling Plan are included in the closure report as requested in your approval letter dated April 21, 2004.

The Revised Certification Report was prepared following the format specified in OAC rule 374-5-50-53 (D). Campbell Soup Company's Certification is attached to this letter.

FILE COPY

We would appreciate your review and approval of closure of the site at your earliest convenience. If any additional information is needed, please contact me at (856) 968-4423 or Mike Kovacich at (734) 213-5024.

Sincerely,

CAMPBELL SOUP COMPANY

Re: Former Holding Pit
Soil Sampling Analytical Results from the *RCRA Site Closure Revised Sampling and Analysis Plan*
Campbell Soup Supply Company, Napoleon
OHD 005 419 171

Dear Dr. Aly:

On February 24, 2004, Campbell Soup Company (CSC) submitted to the Ohio Environmental Protection Agency (Ohio EPA) a revised sampling and analysis plan for the former holding pit located in Napoleon, Ohio. This document was titled *RCRA Site Closure Revised Sampling and Analysis Plan.* Ohio EPA approved this document on March 5, 2004. CSC completed sampling of the former holding pit on March 17, 2004 and submitted the soil sampling analytical results to Ohio EPA on April 5, 2004.

Ohio EPA has reviewed the analytical results and agrees with the conclusions provided in the cover letter. In particular, Ohio EPA believes that the data obtained from the March 17, 2004 sampling event is similar to the data used to represent the backfilled area. However, to this date Ohio EPA has not received quality assurance/quality control (QA/QC) information for the March 17, 2004 sampling event. Without this information, Ohio EPA cannot finalize conclusions on the data. Although Ohio EPA needs to review the QA/QC information before finalizing conclusions, Ohio EPA does not intend to delay the closure process further. Therefore, Ohio EPA is granting CSC permission to include the QA/QC information from the March 17, 2004 sampling event in the revised certification document.

If you wish to arrange a meeting to discuss responses to this letter, please contact me at (419) 373-3065 at your convenience.

Sincerely,

Kara Reynolds

Re: Soil Sampling Analytical Results
Campbell Soup Supply Company, Napoleon, Ohio

Dear Ms. Reynolds:

On March 17, 2004, GeoTrans, Inc. (GeoTrans) conducted soil sampling at the above-referenced site, as detailed in the Revised Sampling and Analysis Plan (SAP) approved on March 5, 2004. The Ohio EPA attended the sampling event to observe sampling methods and ensure compliance with the SAP. The Geoprobe™ Dual Tube sampling technique was used to collect the first soil sample at PB-04-62, in accordance with the SAP. Due to poor sample recovery when using the Dual Tube sampling method, GeoTrans proposed using the Geoprobe™ Macrocore sampling technique instead. This revision to the sampling plan was verbally approved by field representatives of the Ohio EPA.

All proposed samples were successfully collected in accordance with the SAP. The samples were submitted to Brighton Analytical on March 18, 2004, for laboratory analysis of the chemicals of concern, using the analytical methods detailed in the SAP. The laboratory analytical report was received by GeoTrans on March 29, 2004. The attached summary table shows the results; Appendix A furnishes a copy of the analytical data. The Level IV quality assurance and quality control data package has not been received from the Laboratory as of this date.

GeoTrans conducted a screening analysis, as outlined in the approved sampling plan, to compare the analytical results from samples PB-04-59 through PB-04-63 with the existing data set. Our screening analysis indicates that the two data sets are similar, as indicated in the following comments:

- With the exception of trace levels of toluene, no VOCs were detected.
- All SVOCs were lower in concentration than the previous maximum detections, except for one sample. Sample PB-04-63 (0.5-1') had the following parameters exceeding their previous maximum concentrations by less than 8 %:
    - benzo(a)anthracene was detected at 1,200 µg/kg, 40 µg/kg higher than the previous maximum detection of 1160 µg/kg.

  - benzo(k)fluoranthene was detected at 1,000 µg/kg, 20 µg/kg higher than the previous maximum detection of 980 µg/kg.
  - chrysene was detected at 1,300 µg/kg, 100 µg/kg higher than the previous maximum detection of 1,200 µg/kg.

- SVOCs were generally lower in concentration in the other samples collected in March when compared to the treated soil piles (VR samples).

- The analytical results from the March 2004 sampling event are qualitatively similar to the data previously used to represent the backfill (Table 1).

Please notify us when you have completed your evaluation of the SAP analytical results. We would like to begin the risk assessment, detailed in Section 3 of the SAP, as soon as possible.

If you have any questions, please call me at 734-213-5024.

Sincerely,

Michael Kovacich, CPG
Senior Hydrogeologist

734-213-2204 FAX 734-213-5008

Dear Sample Check In,

To ensure compliance with the Ohio EPA approved Sampling and Analysis Plan (SAP) please include the following items in your analytical reports:

1. In addition to your standard 8260b parameter scan please include the following 9 VOCs:
   - 1,1-dichloropropene
   - bromobenzene
   - 2-chlorotoluene
   - 4-chlorotoluene
   - tert-butylbenzene
   - sec-butylbenzene
   - 1,2-dibromo-3-chloropropane
   - hexachlorobutadiene
   - vinyl acetate

2. Detection limits should match those posted in Table 1 (a copy of the table is attached) of the SAP.

3. J values should be posted.

4. Level IV QA/QC package, with case narrative, should be provided.

If you should have any question regarding the chain of custody and this letter please do not hesitate to call me at 734.213.5024.

Re: Sampling and Analysis Plan Approval
Campbell Soup Supply Company, Napoleon
Former Holding Pit
OHD 005 419 171

Dear Dr. Aly:

On February 2, 2004, Campbell Soup Company submitted to the Ohio Environmental Protection Agency (Ohio EPA) a sampling and analysis plan (SAP) for the former holding pit located in Napoleon, Ohio. This document was titled *RCRA Site Closure Sampling and Analysis Plan*. Ohio EPA reviewed this document and issued comments to Campbell Soup Company on February 19, 2004. Campbell Soup Company issued a revised document titled *RCRA Site Closure Revised Sampling and Analysis Plan* on February 24, 2004.

Ohio EPA has reviewed the *RCRA Site Closure Revised Sampling and Analysis Plan* and is hereby approving the SAP. Campbell Soup Company shall notify the Ohio EPA at least five (5) days prior to beginning the field work associated with the SAP.

Sincerely,

Kara M Reynolds

Re: Former Holding Pit
RCRA Site Closure Sampling and Analysis Plan
Campbell Soup Supply Company, Napoleon
OHD 005 419 171

Dear Dr. Aly:

On February 2, 2004, this office received a document titled *RCRA Site Closure Sampling and Analysis Plan: Former Holding Pit Unit*. This document described a sampling and analysis plan for a sampling event to aid in the closure at the Napoleon site. Ohio EPA has reviewed the document and offers the following comments:

1. General. Campbell Soup Company (CSC) does not describe quality assurance/quality control (QA/QC) measures to be implemented during this sampling event. The Ohio Environmental Protection Agency (Ohio EPA) would like to remind CSC that Ohio EPA approved QA/QC measures should be followed during this sampling and analysis event to ensure the validity of the data. CSC shall provide Ohio EPA with enough QA/QC information to complete Ohio EPA's Data Validation Plan Review Form included in the September 4, 2003, Notice of Deficiency (NOD) letter as Appendix II, Tier I Checklist. This required information includes, but is not limited to, the following: completed chain of custody forms, signed laboratory statement, date samples received by laboratory, date samples extracted by laboratory, date samples analyzed by laboratory, method blank data, field blank data, laboratory control sample data, matrix spike data, and matrix spike duplicate data. CSC shall revise the Sampling and Analysis Plan (SAP) to include the necessary QA/QC procedures.

   Ohio EPA would also like to specifically request that duplicates be acquired at a rate of one duplicate per 10 samples, one duplicate sample per day, and at least two duplicate samples per the entire sampling event. CSC shall revise the SAP to include this procedure.

2. Section 2.2, Sampling Locations, Page 5. CSC does not propose to collect extra soil samples. Ohio EPA would like to recommend that extra samples be collected and held in case QA/QC or other problems demonstrate the necessity for additional samples.

Printed on Recycled Paper

3. Section 2.3, Sampling Procedure, Page 6. CSC has made several references to utilizing a photoionization detector (PID). A PID does not register the presence of semi-volatile organic compounds (SVOCs) and since the majority of the chemicals of concern (COCs) that are expected to exist in these samples are SVOCs, Ohio EPA does not understand the relevance to using this instrument. CSC shall add language in this section to clearly state that Encore samples for volatile constituents shall be taken first, prior to taking soil for screening purposes.

4. Section 2.3, Sampling Procedure, Page 6. CSC has not described waste handling procedures to be utilized during the sampling event. CSC shall revise the SAP to provide this information. CSC shall also include the process used to handle both the solid and liquid waste from the sampling event, where the waste will be disposed, how the waste will be transported, estimates of the volume of solid/liquid waste that will be generated from the sampling event, etc.

5. Section 2.4, Laboratory Analysis, Page 7. CSC has omitted an important analytical method from this section. CSC shall revise the SAP to include Method 5035 in this section.

6. Section 2.4, Laboratory Analysis, Page 7. It is unclear as to whether constituents will be removed from the list of analysis while using the specified EPA methods. CSC will analyze all samples for the appropriate list of COCs that correspond with the EPA 8260B and 8270 methods, including all 68 site specific COCs. CSC will not remove any COCs from the list of analysis for these methods.

7. Section 2.4, Laboratory Analysis, Page 7. Ohio EPA has found that the definition of "reporting limit" varies depending on the laboratory employed. As such, CSC shall revise the SAP to include a definition for reporting limit in this section.

   Also, CSC shall describe the reporting procedures in more detail. CSC shall include in the revised SAP whether results above the method detection limit will be reported and steps taken if the reporting limit is elevated above the risk level.

8. Section 2.5, Data Evaluation, Page 7. CSC describes the screening criteria as the following: "The minimum screening concentration is equal to the reporting limit. The maximum screening concentration was calculated by multiplying the existing maximum detected concentration by 1.15." CSC shall revise the screening analysis discussion in this section and all subsequent sections to demonstrate that the minimum screening criteria is the minimum detection limit and the maximum screening criteria is the maximum detected concentration. If the results from the sampling event do not correspond with these levels, then alternatives will be proposed. Until then, Ohio EPA requests that the data lists not be manipulated.

9. Section 3.2, Risk Assessment Methodology, Page 9. The first sentence in this section reads "The maximum detected concentration or Upper Confidence Limit (UCL) for each chemical of concern, except the five described below, will be divided by . . . " CSC proceeds to reference Comment 37 of the NOD dated September 4, 2003. Ohio EPA's reasoning behind Comment 37 is based on different criteria including, but not limited to, frequency of detection of these COCs and remediation/removal of the corresponding sampled soil. If these COCs are present in any samples, then these chemicals will need to be evaluated. As such, Ohio EPA requests that CSC proceed by assuming that the five COCs listed in this section will be included in the risk assessment. If all samples show that these five COCs are not detected, then they will not be included in the risk assessment as long as the criteria in Comment 37 of the NOD are met. CSC shall delete all references in the SAP that exclude the five COCs in the risk assessment.

10. Section 3.2.1, Preliminary Risk Assessment, Page 10. The first sentence of this section reads "The maximum concentration of each COC (except the five specified above) from the 165 samples shown in Table 3 . . . " Table 3 lists 170 samples from the closure. Of these 170 samples, Ohio EPA believes that 169 of these samples should be included in the risk assessment. Sample IS-02-02 did not meet QA/QC qualifications and was resampled. This sample does not need to be included in the evaluation. However, CSC has not provided an explanation on the four remaining samples omitted from the risk assessment. Ohio EPA requests that CSC explain the reasons for excluding these samples.

11. Table 1, Chemicals of Concern with GCN's. CSC does not list the units associated with the reporting limit on this table. CSC shall include this information in the revised SAP.

12. Table 1, Chemicals of Concern with GCN's. CSC has not included the five COCs that were referenced in Comment 37 of the September 4, 2003, NOD. CSC shall revise the table to include the five COCs that were omitted as explained in Section 3.2, Risk Assessment Methodology.

13. Table 2, Existing Backfill Analytical Data. Ohio EPA accepts J valued data. As such, CSC shall revise this table to show the maximum concentration under "Screening Criteria" regardless of its estimated value.

14. Table 2, Existing Backfill Analytical Data. The minimum concentration under "Screening Criteria" is not always listed as the minimum detection limit. CSC shall revise the table to show the minimum concentration under "Screening Criteria" to be the minimum detection limit.

15. Table 2, Existing Backfill Analytical Data. CSC has shown the maximum concentration under "Screening Criteria" as the maximum concentration of the COC multiplied by 1.15. CSC shall revise this column to show that the maximum concentration under "Screening Criteria" is the maximum concentration of the COC.

If the results from the sampling event do not correspond with these levels, then alternatives will be reviewed. Until then, Ohio EPA requests that the data lists not be manipulated.

Please provide a revised Sampling and Analysis Plan (SAP) within thirty (30) days of the receipt of this letter.

The revised SAP should be prepared in accordance with the following editorial protocol or convention:

1) Old Language is over-struck, but not obliterated.

2) New Language is capitalized.

3) Page headers should indicate date of submission.

4) If significant changes are necessary, pages should be re-numbered, table of contents revised, and complete sections provided as required.

If you wish to arrange a meeting to discuss responses to this letter, please contact me at (419) 373-3065 at your convenience.

Sincerely,

Kara Reynolds

Subject: Re: Quick Question

Kara,

It is impossible to know specifically where the soil sample locations from the CS series, the IS series and the VR series are, aside from somewhere in the backfill. These samples were collected from soil stockpiles prior to placement as backfill in the excavation. So, the simple answer to your question is "no".

How is the review of the SAP going?

Mike

>>> "Kara Reynolds" <Kara.Reynolds@epa.state.oh.us> 02/18/04 07:24AM >>>
Good Morning Michael,

Just a quick question for you. Looking at the map of how the holding pit looks now, is there any way to say where certain samples are in the backfill?

I'm pretty sure the answer is no, but I wanted to double check.

Thanks,

Kara

Kara:

Many thanks for your comments and I am glad you are aware of Campbell's interest in closing this project as soon as feasible. No sampling will take place till all the issues have been resolved and we get the needed approval of the SAP. However, I would appreciate your help and assisstance in expediting this process so we would have a successful closure in a reasonable amount of time.

Sincerely,

OSMAN M ALY

Subject: Sampling and Analysis Plan

Dr. Aly,

I received your voice mail this morning and tried to contact you via phone. I left a message and decided to send this e-mail as well.

I understand that you would like to go ahead and take the proposed samples from the Sampling and Analysis Plan (SAP) dated January 30, 2004. However, I would recommend that Campbell's NOT sample until the SAP has been approved. I am in the process of finalizing comments from our offices and hope to have these comments completed by the end of the week. I understand that this entire closure process has taken longer than expected and I understand Campbell's need to complete closure ASAP. However, I would not feel comfortable allowing Campbell's to sample before the SAP has been approved. There are some technical issues that still remain and to avoid any more problems, I would not sample the former holding pit yet.

Please feel free to call me at your convenience.

Respectfully,

Kara Reynolds

"Campbell Soup
2004"

From: Erik Hagen
To: Kara Reynolds
Date: 2/17/04 1:31PM
Subject: Campbell's SAP

Kara,

I'm basically OK with the SAP. I do have some concerns. They are:

1. How do the proposed locations correlate with previous sampling results?
(you already said that you thought the locations were OK)

2. 2.3 Sampling Procedure. They SAP did not discuss quality control samples. In particular duplicates samples and the frequency of duplicate sample acquisition. This is somewhat important for this case. If duplicates samples show short scale heterogeneity, then this may affect our interpretation.

3. Section 2.4 Laboratory Analysis/ Data Evaluation . The SAP should spell out the reporting limits that the lab will use to present the data. Since we are dealing with comparing two sets of samples and comparing the overall results to risk values, we need to know what will happen it the RL is elevated compared to the risk level or if the RL will be different from the data we are comparing. In addition, we need to know if results below the RL will be reported (ie. will any value above the MDL be reported).

4. Section 2.4 Sampling Procedure. They SAP speaks of using a PID to evaluate a core. Why? We are not deciding on core intervals to sample. In addition, PID is not effective for SVOCs. The SAP must clearly state that Encore samples for volatile constituents must be taken first, prior to taking soil for screening.

5. 2.4 Laboratory Analysis. Method 5035 should be included in this section.

6. 2.5 Data Evaluation: I don't understand the proposed screening method. As far as I remember it was not discussed. However, I'm open to any type of evaluation. At this point, I'm reluctant to agree to this approach. I'd rather look at the data from several different angles which may even include statistics. I would prefer that the language include some acknowledgment that other evaluation methods will be used to assess the data.

Let me know if you have any questions,

Erik

Comments on the DRAFT SAP

Section 2.2, Sampling Locations-Ohio EPA would like to note that the final sampling locations have not yet been determined. After the January 13, 2004 phone conversation with Campbell Soup Company (CSC), Ohio EPA understands that CSC will determine the different depths of backfill from the results of the final survey. The depth of the borings and samples will depend on the depth of the backfill. CSC needs to collect at least 12 samples for analysis. CSC will core and sample down to the bottom of the backfill in the final sample locations. Assuming a three foot tube interval, CSC shall take a sample at each three foot interval at each sample location. If there are more than three intervals (and thus more than three samples) at one soil boring location, then CSC will submit the sample from the top of the backfill, the bottom of the backfill and a middle sample. CSC will hold the extra sample(s) from the middle of the soil boring in case they are needed for further characterization or as hold samples. Ohio EPA recommends that extra samples (and thus extra borings) be taken as hold samples if the depth of backfill is not greater than three intervals at each sampling point.

Section 2.4, Laboratory Analysis-CSC will analyze the soil samples for the 68 chemicals of concern (COCs) utilizing the same analytical methods as in previous closure samples. CSC will not remove any COCs from the list of analytes.

Section 2.5, Data Evaluation-Line three of this paragraph should include language that states COCs detected in the existing backfill will not only be identified, but will also be quantified.

Section 2.5, Data Evaluation-It is unclear how the range of acceptable concentrations has been determined. CSC shall explain in better detail how this range will be derived. Also, Ohio EPA requests that the following ranges be included in the revised SAP.

a. The range of detection limits for each COC.
b. The range of detected values for each COC.
c. The overall range (the minimum detection limit to the maximum detected value) for each COC.

Section 2.5, Data Evaluation-CSC shall include the following wording at the end of this section. "If it is determined that the analytical results from this sampling event are not consistent with the sampling results from the previous sampling events, then CSC will work with Ohio EPA to determine the next step in this closure. This may include, but is not limited to, a full definition of the extent of contamination".

Section 3.2, Risk Assessment Methodology-CSC has not listed the non-cancer risk level correctly. The second sentence shall include the following language "...Non-Cancerous ratios that is I.0 or less and a sum of the...".

Section 3.2.2, Limited Statistical Evaluation-CSC will use ½ the detection limit for each specific

sample in the statistical evaluation. CSC will also include the detection limit for each sample in the SAP.

Subject: DRAFT Outline for SAP

Kara,

Attached to this e-mail is a DRAFT outline of a sampling and analysis plan (SAP) for the Campbell site in Napoleon, Ohio. Please review. As you will note in the outline, a survey crew is scheduled to be on site next week to complete staking of the grid nodes you and Mike discussed and to complete a final grade survey. The survey data will be processed prior to submittal of the SAP. Please let us know if you have any concerns with the proposed content for the SAP.

DRAFT

DRAFT OUTLINE FOR SAP

1.0 GENERAL

1.1 Site Status

Summarize site status including December 8, 2003 correspondence (chose Option c)

1.2 Purpose and Scope

The Purpose of the SAP will be to collect soil samples to validate the existing data currently used to characterize the backfill sample series (the clean soil stockpile (CS), the intermediate soil stockpile (IS), and the verification of remediation (VR) samples). If the new data is consistent with the previous data, then Campbells will proceed with the statistical and risk assessment methods as outlined in this SAP to obtain unrestricted closure of the site.

DRAFT OUTLINE FOR SAP

2.0 SAMPLING PLAN

2.1 Site Survey

Four soil boring locations will be staked by a field survey crew at the following grid nodes within the backfill area (the grid nodes are shown in Figure 6 sent to you on October 28, 2003):

- 40 W : 40 N
- 40 W : 120 N
- 80 W : 40 N
- 80W : 120 N

These four locations will re-establish the sampling grid used during remediation activities at this site. In addition, an elevation survey will be completed to determine the final grade. Survey work will occur during the week of January 12, 2003, prior to submittal of the SAP.

2.2 Sampling Locations

The four locations described above were chosen to represent each ¼ of the backfill area. We are proposing 2 discrete samples (shallow and deep) be collected from each location. The shallow sample will be collected between 0.5 and 1-foot below surface grade. The deep sample will be collected between 1 and 1.5-feet above the bottom of the backfill. The thickness of the backfill will be determined from the final grade and final excavation surveys. Following receipt of the survey data, the depths of the samples will be finalized based on the thickness of the backfill.

2.3 Sampling Procedure

A GeoProbe™ utilizing dual tube drilling methods will be used to collect the soil samples.

2.4 Laboratory Analysis

Soil samples will be analyzed for VOCs and SVOCs by EPA Methods 8260B and 8270, respectively. Specifically, the soil samples will be analyzed for the following chemicals of concern: *(68 COCs as defined in the Certification Report)*

2.5 Data Evaluation

The existing data currently used to characterize the backfill consists of the clean soil stockpile samples (CS), the intermediate soil stockpile samples (IS), and the verification of remediation (VR) samples. COCs that are detected in the existing backfill will be identified. A range of acceptable minimum and maximum concentrations for the identified COCs will be outlined in this section and will be based on the current analytical data from the backfill sample series. This range will be used to determine if the new analytical data is consistent with the analytical data from the backfill sample series. If the analytical results are consistent then we will proceed with the risk assessment as outlined in Section 3.

DRAFT

DRAFT OUTLINE FOR SAP

3.0 CLOSURE STRATEGY

As outlined in the Ohio EPA's December 8, 2003, correspondence, if the results are comparable to the existing backfill data Campbell with proceed with site closure. The risk assessment strategy that will be used to obtain unrestricted closure is outlined below:

3.1 Risk Assessment Sample Set

All soil samples within the limits of the closure unit will be included in the risk assessment. The risk assessment sample set will consist of the following:

- 1999 investigation samples
- 2001 investigation samples
- 2002 investigation samples
- Confirmation samples (floor and sidewall of excavation)
- Verification of remediation samples (treated soil stockpiles)
- Overburden soil stockpile samples (clean soil stockpile (CS) and intermediate soil stockpile (IS))
- Test Pit samples (vertical delineation below bottom of excavation)
- 2004 samples associated with the SAP

Only those samples that remain on site will be included in the risk assessment. The SAP will contain a table outlining all samples to be used in the risk assessment. Please refer to the "Sample Fate" table sent to you on October 28, 2003.

3.2 Risk Assessment Methodology

The maximum detected concentration or Upper Confidence Limit (UCL) for each chemical of concern will be divided by its corresponding Cancerous and Non-Cancerous GCN and the ratios will be summed to determine if the risks and hazard indices are acceptable. A sum of the Non-Cancerous ratios that is less than 1.0 and a sum of the Cancerous ratios that, when multiplied by 10^-5, is 1E^-5 or less, indicates that the environmental risk at the site is less than the Ohio EPA action level and the site will be closed with unrestricted use.

DRAFT OUTLINE FOR SAP

3.2.1 Preliminary Risk Assessment

Using only the maximum concentration for each COC the ratios will be summed. From this evaluation COCs will be selected for a statistical evaluation to determine the UCL, as outlined below.

3.2.2 Limited Statistical Evaluation

A statistical evaluation will be preformed for each COC where a UCL is substituted for the maximum concentration in the risk assessment. All samples in the risk assessment sample set will be included in the statistical evaluation. Samples that do not exhibit a concentration above the detection limit will be included in the statistical evaluation at ½ of the detection limit. Because the sample concentration data do not follow a normal or log-normal distribution the test for proportions nonparametric test of the median will be used to calculate the confidence interval and 90^{th} percentile upper confidence limit. The 90^{th} percentile upper confidence limit will be used as the exposure point concentration in the risk assessment.

3.2.3 Final Risk Assessment

The risk assessment will be reassessed by substituting the maximum concentration with the UCL for the chemicals of concern identified in Section 3.2.1.

RE: Former Holding Pit
RCRA Site Closure Certification Report
Campbell Soup Supply Company, Napoleon, Ohio
OHD 005 419 171

Dear Ms. Reynolds:

This is in response to your letter of December 8, 2003 concerning the available options proposed by Ohio EPA to choose from for determining the appropriate exposure and risk that the contaminated media at the site poses to human health and the environment.

After review of the three options, Campbell Soup Company decided to proceed with option (c), which requires taking several core samples in the existing backfilled area, using a SAP subject to approval by Ohio EPA to determine the validity of the present data as outlined in your letter. Through e-mail correspondence, conference calls and a site visit, the Ohio EPA and Campbell have come to a general agreement on the elements of the Sampling and Analysis Plan (SAP) as required by option (c). The primary elements of the SAP were outlined in our December 30, 2003 e-mail. Campbell will submit a draft SAP that incorporates these elements to the Ohio EPA for your review and approval.

If you have any questions or concerns, please do not hesitate to call me at 856 968-4423, or contact Mr. Michael Kovacich at 734 213-5024.

Sincerely,

CAMPBELL SOUP COMPANY

Dawn Pleiman - Fw: Campbell's waste codes

From: Geoff Sans <geoff_sans@campbellsoup.com>
To: Dawn Pleiman <Dawn.Pleiman@epa.state.oh.us>
Date: 5/24/2010 4:51 PM
Subject: Fw: Campbell's waste codes

Dawn,
As promised, I have reviewed the Hazardous Waste Manifests for the past three years on the materials that were removed from our site with the following results;

1. Waste Code D001 aerosol cans, paint cans, diethyl ether, gasoline, mineral spirits, diesel fuel, petroleum distillates, acetylene dissolved
2. Waste Code D001/D002 hydrogen peroxide peroxyacetic Acid
3. Waste Code D001/D005 Ink, methyl ethyl ketone
4. Waste Code D002 Acid - Chemtreat CT236, phosphoric acid, potassium hydroxide,sodium hydroxide, Nalco-Acti-Brom R 7342 Product (Alkaline Liquid Bromide Antimicrobial)
5. Waste Code D009 Mercury instruments
6. Waste Code D013/U279 Lindare, Carbaryl
7. Waste Code D013/D014 aerosols (Lindane,Methoxychlor)
8. Waste Code D022/U044/U080 chloroform, methylene chloride

You are correct in that most of the material that is shipped out is in fact video jet ink/solvent, mercury instruments, paint and aerosol cans which for the most part are empty. The other items tend to be things that are no longer used at the site, oil absorbent material used to clean up minor petroleum spills and chemicals used for pacification of metal equipment like our cookers.

As far as the underground tanks are concerned, to the best of our knowledge the information is correct with the understanding that most of it was provided by the Bureau of Underground Storage Tanks (an Ohio State Regulatory Agency).
Any questions, please ask,
Geoff

Subject: Re: Campbell's waste codes

Dawn,
Just wanted to let you know that I did get your two emails and am working on our SPCC plan and a response to your questions. Please note current status below;

First, we are in the process of reviewing our Manifests from the last three years. We have sent out a few items under other Hazardous Waste categories. Once I have that information put together I can respond to your question in this email.

Secondly, because of the revisions of the regulations that are coming into play, we hired Orbital Engineering (since

purchased by SSOE) to review our site and current plan. Based on their recommendations, we are in the process of adding other equipment that contains 50 gallons or more of petroleum product, most of which are internal to our buildings. Once we complete this review we intend to hire a consultant (PE) to rewrite our entire plan.
If you have any questions, please let me know,
Thanks,
Geoff

"Dawn Pleiman" ---05/10/2010 01:35:26 PM---Hi Geoff, I have a few more questions for you.

Subject: Campbell's waste codes

Hi Geoff,
I have a few more questions for you.
Campbell's Main Plant (OHD 005 419 171) only generates hazardous waste video ink and thermometers, correct? so EPA waste codes D001, F005 and D009
Does Campbell's use the waste codes for other waste (meaning is any other hazardous waste generated that I might have missed).

Campbell's does not ship "parts washer solvent" as hazardous anymore since Heritage recycles it. Is this correct?

Thanks for the clarifications,
Dawn

Re: Corrective Action Site Visit of August 11, 2008
OHD 987 046 703, V-8 Beverage Plant, 12-995 State Route 110
OHD 987 023 678, Chemical Residue Analytical Lab, P-152 County Road 12

Dear Mr. Sans:

On August 11, 2008, Ohio EPA met with Campbell Soup Supply Co. (CSS) to discuss RCRA Corrective Action and tour the facility to identify units that may be subject to corrective action. CSS was represented by Geoff Sans, Manager, Services & Utilities; Jim Koskan, Area Manager Services & Utilities, and Mike Maringer, consultant and former employee. Ohio EPA was represented by Dawn Pleiman and Michael Terpinski. The meeting commenced with a discussion of the other two Campbell Soup properties identified by Ohio EPA as being subject to RCRA corrective action, the V-8 Beverage Plant and the Chemical Residue Analytical Lab.

Discussions between both parties determined that although the Beverage Plant and Chemical Residue Analytical Lab were included in a 1994 letter which cited CSS for unpermitted storage and treatment of hazardous wastes in a (coal) waste pile prior to burning in an on-site boiler: the waste pile was located on the Main Plant's property. When soil beneath the waste pile was sampled in 1994 and found to have not negatively impacted the soil, the violation was abated by Ohio EPA.

In March of 2000, it was brought to Ohio EPA's attention that waste coating material used by CSS on steel cans as a rust inhibitor was stored on-site from 1980 to 1981. From roughly 1981 to 1993 the liquid phase of the waste in the drums was either burned directly in Campbell's boilers or poured onto a coal pile and then burned in the boilers. The semi-solid waste in the drums was placed in clay-lined pits and in 1983 the material was mixed with sand prior to excavation and disposal at a landfill. All three CSS Napoleon facilities were cited with an ORC 3734.02(E) violation for unpermitted treatment, storage and disposal (in a May 16, 2000, Ohio EPA correspondence).

Since all of the violations occurred on the Main Plant's property, the corrective action site visit only needed to focus on the Main Plant. Ohio EPA also concluded that the Beverage Plant and the Chemical Residue Lab should be removed from Ohio EPA's list of facilities subject to RCRA Corrective Action. Therefore, with this letter, Ohio EPA wishes to correct any errors in the Agency's records and U.S. EPA's RCRA Info database. In summary, the V-8 Beverage Plant, located at 12-995 State Route 110, and the Chemical Lab, located at P-152 County Road 12, in Napoleon Ohio were not treatment, storage or disposal facilities, and **are not subject to the RCRA Corrective Action requirements under Ohio law** as a result of the Ohio Revised Code 3734.02(E)(F) violations cited in Ohio EPA Notice Of Violation letters dated April 26, 1994 and May 16, 2000.

The Main Plant (OHD 005 419 171) remains subject to RCRA Corrective Action and is addressed in a separate correspondence.

If you have any questions on this correspondence, please do not hesitate to contact me at (419) 373-3148.

Sincerely,

Dawn Pleiman

Napoleon, Ohio 43545

Dear Mr. Maringer:

Thank you for your December 8, and December 12, 2003, responses to Ohio EPA's November 14, 2003, Notice of Violation letter. You submitted documentation including: a copy of the manifest for the video jet ink waste and two photos of the container and the label for this waste.

My review of this documentation reveals that Campbell Soup Company's Beverage Plant has adequately demonstrated abatement of the violation discovered during my November 10, 2003, inspection.

If you have any questions, please contact me at (419) 373-3074.

Sincerely,

Don North

Don North – District Representative

Dear Mr. North,

December 8, 2003

To correct the measures as stated in your letter dated November 14, 2003, to Campbell Soup Supply Company (OHD 005419171), the following items have been completed.

The Video Ink Jet Waste (F005). A telephone call was made to Heritage Environmental Services to correct the determination of this waste from D001 to F005. On November 21, 2003, Heritage removed the two waste ink drums from the Main Plant and Beverage Plant (see Manifest Attached). To further clarify this determination, a F005 sticker was placed on the new accumulation drums.

Main Plant

Waste Thermometers (D009) The thermometers observed during the inspection were removed by Heritage Environmental Services (see attachment) on November 1, 2003. To provide better awareness on open lids, a sticker was placed on the accumulation drum stating "Keep Lid Closed". Also, personnel were instructed to call my extension when the drum is three quarters full to prevent raised lids.

Please contact me if you have any additional questions.

M. A. Maringer

CESQG/TSD
Notice of Violation

November 14, 2003

Mr. Michael Maringer
Manager, Services & Utilities
Campbell Soup Company
12-773 St. Rt. 110
Napoleon, Ohio 43545

Dear Mr. Maringer:

Thank you for accompanying me during Ohio EPA's November 10, 2003, inspection of Campbell Soup Company's (CSC-BP) Beverage Plant (OHD 987046703) at 12-995 St. Rt. 110 in Napoleon, Ohio. We were also accompanied by Kara Reynolds and Dawn Pleiman of Ohio EPA and Mr. Jim Koskan of CSC. I inspected CSC-BP to determine its compliance with Ohio's hazardous waste laws as found in Chapter 3734. of the Ohio Revised Code (ORC) and Chapter 3745. of the Ohio Administrative Code (OAC). During the inspection we also discussed ways to prevent pollution by reducing waste. This letter will explain the violation I found and what you need to do to correct the violation.

CSC-BP produces heat processed food products including several types of vegetable juices. The general process involves the following steps: (for Splash) concentrate hydrated → filled → coded → boxed; (for V8) vegetables pressed → liquid mixed → filled → coded → boxed. Very little hazardous waste is generated since most of the materials used in the plant must be food grade materials. Kettles are cleaned with food grade cleaners and the wastewaters go to the on-site wastewater treatment plant.

The following hazardous wastes are generated in CSC-BP:

Beverage Plant **OHD 987046703** / CESQG-TSD

1. Video Ink Jet Waste (F005) This waste is generated from cleaning the video ink jet machines. When the ink runs out the machine is programed for cleaning mode. The cleaner is 68% MEK (Methyl Ethyl Ketone). Approximately two 55-gallons drums of this waste is generated each year.

Printed on Recycled Paper

2. Waste Paint (D001) This waste is generated from cleaning painting equipment and left over paint. The plant paints walls, stripes and rails, etc.

3. Used Oil (Non-hazardous) Used oil is accumulated in 55-gallon drums and stored in a curbed and fenced area outside the main plant. It is recycled by Midwest Environmental.

I found the following violation of Ohio's hazardous waste laws. In order to correct this violation you must do the following and send me the required information **within 30 days** of your receipt of this letter:

1. **Waste Evaluation**
OAC Rule 3745-52-11

A person who generates a waste must determine if the waste is listed as a hazardous waste in rules 3745-51-30 to 3745-51-35. CSC-BP had failed to determine that its video ink jet waste was listed as an F005 hazardous waste. CSC-BP had characterized the waste as ignitable (D001) waste only. The Make Up (cleaning) solvent contains 68% MEK and, therefore, should have been designated as an F005 waste.

In order to correct this violation, CSC-BP must record the hazardous waste number F005 on all future manifests for the video ink jet waste from the Beverage Plant and submit to me either a copy of the next completed manifest, or a revised copy of a manifest, as an example, if the waste will not be shipped off-site within 30 days. CSC-BP must also submit to me a photograph documenting that the hazardous waste label is marked with the hazardous waste number F005.

We discussed annual training that you participate in and you indicated an interest in hazardous waste management training provided by the University of Findlay. Here is the web site for the program: http://seem.findlay.edu/ESH/default.asp.

For your information, I have enclosed a copy of the following fact sheets and lists: The Regulation of Used Oil: An Overview for Ohio Businesses - Used Oil Generators, Commercial Used Oil Marketers and Recyclers, Fluorescent Lamps Fact Sheet, Computer, Fluorescent Lamp and Ballast Recyclers and Management of Electronic Waste From Business.

As we discussed during the inspection, you may be able to reduce the waste your company generates. If you find ways to recycle, reduce or altogether eliminate the amount of waste that your company generates you may be able to reduce your treatment and disposal costs and you may possibly reduce your regulatory requirements.

If you would like more information about pollution prevention, or if you would like to be considered for an in depth, on site pollution prevention assessment, please contact me at (419) 373-3074 or Ohio EPA's Office of Pollution Prevention (OPP) at (614) 644-3469.

The Division of Hazardous Waste Management has created an electronic news service to provide you with quick and timely updates on events and news related to hazardous waste activities in Ohio. If you haven't already, we encourage you to sign-up for this free service. You can find more information at the following Web link http://www.epa.state.oh.us/dhwm/listserv.html. Please feel free to share this information with your colleagues.

Enclosed you will find a copy of the checklists that I completed during the inspection of the Beverage Plant. Should you have any questions, please feel free to contact me at (419) 373-3074. You can find copies of the rules and other information on the division's web page at http://www.epa.state.oh.us/dhwm. Ohio EPA also has helpful information about pollution prevention at the following web address: http://www.epa.state.oh.us/opp.

Sincerely,

Don North

✓	Conditionally Exempt SQG (CESQG)	✓	Containers
____	Small Quantity Generator (SQG)	____	Tank(s)
____	Large Quantity Generator (LQG)	____	Other (specify)
____	No Generation		

CESQG:< 100 Kg. (approximately 25-30 gallons) of waste in a calendar month

SQG: Between 100 and 1,000 Kg. (about 25 to under 300 gallons) of waste in a calendar month

LQG: >1,000 Kg. (~300 gallons) of waste in a calendar month or > 1 Kg. of acutely hazardous waste in a calendar month

NOTE: *To convert from gallons to pounds: Amount in gallons x Specific Gravity x 8.345 = Amounts in pounds*

POLLUTION PREVENTION

Note to the Inspector: This checklist has been developed to help the division in gathering general information about the pollution prevention (P2) practices that the company may have initiated or attempted to initiate. The checklist is also used to:

- Facilitate P2 discussions;
- Identify barriers to P2;
- Define the P2 universe;
- Identify the need for future P2 initiatives;
- Identify partnership opportunities; and
- Link companies with better P2 resources.

As a prelude to completing this checklist the inspector should use the following list of questions as a way to initiate a dialogue concerning P2:

1. Have you tried to reduce the volume of waste (hazardous and nonhazardous) that you generate?

2. What is the largest waste stream that you generate?

3. How important would it be to you to eliminate that waste stream?

4. Does your company understand the reduced regulatory burden and cost saving benefits that eliminating or reducing a waste stream can have?

5. Could you use better housekeeping practices to reduce the amount of waste that you generate?

If the company responds with one of the answers below, the appropriate box should be checked. If the company's response does not correspond to one of the options below, please record the answer in the space provided in the remarks section.

1. Has the company undertaken any P2 activities to reduce the amount of waste generated? ☐Yes ☑No ☐N/A ___RMK#

   a. If so, what has the company done to minimize waste generation?

   - ☐ A change in the process resulting in less waste.
   - ☐ A change in the product resulting in less waste.
   - ☐ Use of fewer and less toxic hazardous raw materials.
   - ☐ Better operations/improved housekeeping.
   - ☐ On-site recycling/reuse of hazardous materials.
   - ☐ Sending waste off-site for recycling/reuse.
   - ☐ Other activities (specify):

Campbell Soup Company used to be a large quantity generator when it manufactured its own cans. However, this business has been sold and is no longer done by Campbell's. Company is now acting as a conditionally exempt small quantity generator.

b. ***If so,*** what wastes have been addressed?

- ❑ Solvents
- ❑ Paint related wastes
- ❑ Industrial process wastes (sludges, slags, contaminated wastes waters, etc.)
- ❑ Contaminated oils/hydraulic fluids
- ❑ Off-spec chemicals
- ❑ Shop rags
- ❑ Other (specify):
- ❑ Waste water
- ❑ Solid waste (paper, plastic, metal, wood, blasting material)
- ❑ Air emissions
- ❑ Energy use
- ❑ Fluorescent light bulbs
- ❑ Used batteries

c. If they haven't minimized waste are there barriers that are preventing them from doing it?

- ❑ Lack of information about practical alternatives.
- ❑ Lack of capital to make process changes.
- ❑ Lack of internal management support.
- ❑ The company does not generate enough waste to consider P2.
- ❑ Other reason given (specify):

2. Does the company plan to do P2 activities in the future? ☒Yes ❑No ❑N/A ___RMK#
Have a recycling committee

3. Would the company be interested in receiving additional information from Ohio EPA about P2? ❑Yes ❑No ❑N/A ___RMK#
Maybe

4. Did you give the company information about P2 during the inspection? ☒Yes ❑No ❑N/A ___RMK#
Gel letter

5. Would the company like a P2 assessment? ❑Yes ❑No ❑N/A ___RMK#

A. If yes, provide information that makes the company a good candidate for an assessment (i.e., known specific P2 opportunities exist, the company is willing to cooperate and commit resources to the assessment, the company fully understands DHWM's P2 assessment process, etc.)
Maybe will call back

B. If no, list the reasons the facility representative gave for not wanting an assessment.
Can't recycle/reuse ink since different colors get mixed. Some inks used because change color w/ heat.

If the company would like a P2 assessment done at their facility, the inspector must give the company representative a copy of the <u>Pollution Prevention for Hazardous Waste Generators</u> document and discuss it with them.

Campbells has expanded its by-products process so that non-saleable soup and beverages (canned) is shredded, dewatered & made into hog food. This keeps thousands of cans of food out of the landfill and provides useful farm food.

REMARKS

Michael Manager does an audit of the plant every 6 months.

Can plant sold to Silgan: Phil Cesen, Plt. Mgr. Carolyn Oberhouse - Envi Coord.

Heritage picks up waste Videojet ink (F005) They also supply + pick up Crystal Klean solvent in parts washers throughout plant. This is a continual reuse program.

Process:

splash: concentrate → hydrate → fill → code → box

V8: vegetables pressed → liquid mixed → fill → code → box (pumice → dog food).

Kettles are cleaned w/ food grade cleaners.

Waste water to on-site WWTP.

(Soaps: nitric, phosphonic ~~acid~~, caustic, bleach)

Fluorescent bulbs collected, boxed + sent to Environmental Recycling.

CONDITIONALLY EXEMPT SMALL QUANTITY GENERATOR REQUIREMENTS

WASTE EVALUATION

(1) Have all wastes generated at the facility been evaluated? [3745-52-11] Yes ___ No ☑ N/A ___ RMK# 1.

GENERATOR CLASSIFICATION

2. Does the generator produce ≤100 kg. of hazardous waste per month? [conditionally exempt small quantity generator ("CESQG")] Yes ✓ No ___ N/A ___ RMK# 2.

NOTE: *If quantities of hazardous waste accumulated on-site at any one time exceed 1,000 Kg. - or the generator produces between 100 and 1,000 Kg of hazardous waste per month, it is operating as a Small Quantity Generator ("SQG").* ***If so,*** *complete the Small Quantity Generator Requirements checklist.*

NOTE: *To convert from gallons to pounds:*

Amount in gallons x Specific Gravity x 8.345 = Amount in pounds

OFF-SITE SHIPMENT OF HAZARDOUS WASTE

3. Does the CESQG ensure delivery of hazardous waste(s) to an off-site permitted TSD? [3745-51-05(G)(3)] Yes ___ No ☐ N/A ___ RMK# ___

REMARKS

1. Campbells generates a hazardous waste cleaning solvent from its video jet printing process. At the time of the inspection, this was designated D001. The cleaning solvent – called Make Up – is 68% MEK. Therefore, the waste must be designated F005 and all records must be revised. It has always been handled as hazardous waste.

2. Less than 2 drums/year of ink waste (F005) and occasionally a small amount of paint waste (D001) from painting walls, stripes + rails.

Re: Henry County, Campbell Soup Company, Hazardous Waste Notice of Violation, OHD 987046703, OHD 987023678, and OHD 005419171.

Dear Mr. Michael R. Terpinski:

This is in response to the notice of violation letter dated May 16, 2000. The following is our response and further explanation of the events that took place involving the temporary holding pit area.

Spent solvent from the former can manufacturing operations at the Napoleon Plant was stored in 55-gallon drums and eventually used as a boiler fuel supplement (Boiler and Industrial Furnace 'BIF' Small Quantity Burner Exemption). Over time solids accumulated in the drums made it difficult to handle. To alleviate the solids, two earth dikes were constructed using a natural clay liner and compacted. The overall dimensions totaled approximately 20 feet wide by 35 feet long, with a depth of 2 ½ feet.

This practice was discontinued and the partially filled dikes were decommissioned in 1983. A local contractor using sand and natural soil excavated the dikes and hauled the material to the Evergreen Landfill for disposal. The material was analyzed by Evergreen at the landfill for disposal.

The earthen dikes were a one-time construction to remove semi-liquid solids from the drums. The practice was discontinued in 1983 with the excavation of the dikes.

We became aware of this practice, as we indicated in our March 23rd, 2000 meeting with you, and we immediately conducted an assessment of the area that resulted in the report we submitted to you.

Campbell Soup plans to conduct a complete investigation to delineate the contamination in the former holding pit area. A work plan will be submitted to your office for review and approval before implementation. We, also, shall submit a closure plan for hazardous waste storage and disposal area, to the Ohio EPA as is required by the applicable regulations.

We will call your office to arrange for a meeting to discuss the work plan and the various closure strategies.

Sincerely,

M. N. Maringer

Hazardous Waste
Notice of Violation

May 16, 2000

Mr. Michael Maringer
Manager, Service and Utilities
Campbell's Soup Company
East Maumee Avenue
Napoleon, Ohio 43545

Dear Mr. Maringer:

On March 23, 2000, a meeting between Campbell's and the Ohio Environmental Protection Agency (Ohio EPA) was held at Ohio EPA's Northwest District Office (NWDO). Campbell's was represented by Dr. Osman Aly and yourself. Ohio EPA was represented by Lorma Wendt (DHWM) and myself.

The following information was revealed during the March 23, 2000 meeting:

While responding to an Ohio EPA request for information relating to the Imthurn drum site investigation, Campbell's conducted numerous employee interviews. These interviews led to the discovery of another predicament from Campbell's past.

Campbell's is a manufacturer of soups, sauces, pork and beans, Splash fruit and vegetable juice, and V-8 vegetable juice. Cans were manufactured on-site until July 1998. Coating machines applied a rust inhibitor, similar to an enamel paint, to the 2-piece steel cans to increase durability. The coating machines needed periodic cleaning (performed with solvents classified as both listed and characteristically-hazardous wastes), thus generating hazardous waste.

The coating material waste consisted of two phases; a liquid phase and a sludge-like phase. Approximately 2000 of these drums from the canning plant were stored on-site behind the container plant on a concrete pad. Dr. Aly stated that during the energy crisis of the late 1970s, Mr. Ellis Imthurn approached Campbell's and asked if he could have the drums to use the waste to fuel the boilers in the abandoned school in which he resided. Dr. Aly stated that this was a one-time agreement that concluded in 1979. According to both Dr. Aly and yourself, the drums were simply stored on-site at the Napoleon plant from 1980 to 1981. According to Campbell's, the liquid phase was either burned directly in Campbell's boilers or placed on a coal pile, then burned in the boilers from 1981 to January 1993.

The semi-solid phase of this waste was not amenable to burning. Therefore, too many drums of the combined waste were being generated (you stated that approximately 22 to 100 gallons of the liquid phase waste was poured on the coal pile per month). The liquid phase was siphoned off and burned in the boilers. The semi-solid phase was dumped into two on-site holding pits from 1981 to 1983. The pits were reportedly lined with natural clay that was obtained on-site and compacted prior to placement of any sludges. You stated that the pits totaled approximately 20 feet by 40 feet and were 2½ to 3 feet deep. There was roughly 2 feet of waste in each pit. In 1983, the material was excavated and disposed of at Evergreen Landfill in Northwood, Ohio. The sludge was mixed with sand prior to off-site disposal.

The coating material waste was classified as a hazardous waste because of its ignitability. However, soil sampling data from the former pit area shows concentrations of compounds (xylene, acetone, methyl isobutyl ketone, ethyl benzene, and methyl ethyl ketone) typically found in F-listed hazardous wastes. Material Safety Data Sheets (MSDSs) for the coating materials and solvents used at the Napoleon plant in the early 1980s provided by Campbell's on April 21, 2000, confirms the presence of these materials. Therefore, the materials disposed of in the holding pit were listed hazardous wastes as well.

On December 2 and 3, 1999, HSI GeoTrans conducted sampling at the former holding pit area. The area was identified based on interviews with Campbell's employees. The results of the sampling were presented in a report titled Limited Subsurface Soil Investigation: Former Holding Pit Area received March 23, 2000. The report shows residual volatile organic chemical (VOC) contamination at depths as great as 10 feet below ground surface as a result of Campbell's former waste management techniques.

Because Campbell's has performed unpermitted treatment (evaporation of materials dumped in the holding pits), storage (from 1980 to 1981), and disposal (from 1981-1983) of hazardous waste, they are in violation of the following hazardous waste law:

1. Chapter 3734.02 (E) of the Ohio Revised Code states in part that: "[N]o person shall establish or operate a hazardous waste facility, or use a solid waste facility for the storage, treatment, or disposal of any hazardous waste, without a hazardous waste facility installation and operation permit from the hazardous waste facility board..."

   Campbell's storage of hazardous waste on-site from 1980 to 1981 constitutes unpermitted storage of hazardous waste. Campbell's is a Large Quantity Generator (LQG) of hazardous waste, and may only store waste on-site for ninety (90) days.

   When the semi-solid hazardous wastes were dumped into the holding pits on Campbell's property, they dried and were mixed with sand prior to off-site disposal at Evergreen Landfill in Northwood, Ohio. This evaporation constitutes unpermitted treatment of hazardous waste. The mixing of this material with sand may also constitute unpermitted treatment if the sand were introduced before the waste hardened.

The hazardous wastes dumped into on-site holding pits at Campbell's from 1981 to 1983 also constitutes improper disposal of hazardous waste. Campbell's does not have a RCRA Part B permit allowing for the treatment, storage, or disposal of hazardous waste.

Please respond, in writing, to this Notice of Violation (NOV) within ten (10) days. Your response must include all actions and timetables necessary to demonstrate compliance. *In addition, a copy of the closure plan for the hazardous waste storage and disposal areas must be submitted to Ohio EPA, NWDO within ninety (90) days of receipt of this letter.* Please call me to arrange a meeting to discuss the document entitled Limited Subsurface Soil Investigation: Former Holding Pit Area. The meeting will also be helpful in discussing various closure strategies available to Campbell's.

Failure to list specific deficiencies in this letter does not relieve you from the responsibility of complying with all applicable regulations.

If you have any questions, feel free to contact me at 419-373-3070.

Sincerely,

Michael R. Terpinski
Division of Hazardous Waste Management

Campbell's Soup

Campbell SOUP Company

NAPOLEON, OHIO 43545

RECEIVED
MAY 27

May 26, 1999

Mr. Mike Terpinski
Northwest District Office Ohio E.P.A.
347 N. Dunbridge Road
Bowling Green, OH 43402

SUBJECT: Campbell Name Change

Dear Mr. Terpinski:

Campbell Soup Company is implementing a new business structure that will be comprised of three companies: *Campbell Soup Company, Campbell Sales Company, and Campbell Soup Supply Company.*

Campbell Soup Supply Company will be a wholly owned subsidiary of Campbell Soup Company. Effective August 2, 1999 *Campbell Soup Supply Company* will operate most of the U.S. manufacturing facilities, including the Napoleon plant.

Therefore, we request that the existing Campbell Soup Hazardous Waste Generator ID's OHD005419171 and OHD987046703 be reassigned or transferred to the new *Campbell Soup Supply Company*, Napoleon plant, effective August 2, 1999.

Please contact me at 419-592-1010 if you have any questions.

Sincerely,

CAMPBELL SOUP COMPANY

Hazardous Waste
Henry County
Return to Compliance

December 12, 1994

Mr. Herb Salsbury, Area Manager
Environmental Control
Box 311 State Route 110
Napoleon, Ohio 43545

Dear Mr. Salsbury:

On April 5, 1994, the Ohio Environmental Protection Agency (Ohio EPA) conducted a hazardous waste compliance evaluation inspection of Campbell Soup Company (Campbell's) located in Napoleon, Ohio. This inspection was conducted in order to determine Campbell's compliance with Ohio's hazardous waste generator regulations as adopted under Chapter 3745 of the Ohio Administrative Code (OAC).

During the inspection, violations of Ohio's hazardous waste regulations were noted. Campbell's was notified of these findings in a letter dated April 26, 1994. On May 4, 1994, Campbell's submitted a response to the Agency's Notice of Violation (NOV) containing a timetable for actions to be undertaken to return to compliance for the two cited violations. A second submission from Campbell's was received June 1, 1994. This communication included a proposal from Law Engineering and Environmental Services (Law) for the sampling of the area underlying coal pile which had ignitable hazardous wastes placed on it prior to January, 1993. The Agency responded to this submission in a letter dated June 16, 1994. On September 12, 1994, this office received a revised work plan for the soils underlying the coal pile to which solvent had previously been applied. On September 23, 1994, this office notified Campbell's that the work plan for the sampling of the coal piles appeared adequate.

On December 5, 1994, this office received a copy of Law's site assessment for the coal piles at Campbell's. The results of Law's sampling and analysis indicate that the practice of pouring solvents on one of the coal piles prior to burning the coal in a boiler has not resulted in elevated levels of any solvents poured on the coal pile in the soil underlying that coal pile.

Printed on recycled paper
(revised 12/93)

Because Campbell's has demonstrated that the application of solvent did not impact the soils underlying the coal pile, the violation of ORC Section 3734.02 cited in the April 26, 1994 NOV is considered abated.

Campbell's is considered returned to compliance for all violations cited in the April 5, 1994 NOV.

Campbell's is reminded that the practice of pouring waste solvent on a coal pile prior to the burning of coal in a boiler for the purpose of energy recovery does not meet the requirements of OAC Chapter 3745-58 ("Miscellaneous Methods of Waste Treatment") and must not occur in the future.

Failure to list specific deficiencies in this communication does not relieve you from the responsibility of complying with all applicable regulations.

If you have any questions, feel free to contact me.

Sincerely,

Michael R. Terpinski
Division of Hazardous Waste Management

RE: **Campbell Soup Company**
Hazardous Waste Henry County

Dear Mr. Terpinski:

Please find enclosed a copy of the report for the Environmental Site Assessment at the Campbell Soup Company plant. The report outlines the results of soil sampling and analysis to evaluate the impact of pouring solvents on the coal piles on the underlying soils. The work was conducted according to the work plan approved by your office in the letter dated September 23, 1994.

The results of the soil assessment indicate that no volatile or semi-volatile compounds including the target compounds in the poured solvents, were detected in the soils underneath the piles. This indicates that the practice of pouring solvents on the coal piles, which has been discontinued, did not impact the underlying soils.

Therefore, we request your approval for closure of this case. Please let me know if you need any additional information.

Sincerely,

CAMPBELL SOUP COMPANY

Re: Campbell's Soup
OHD 987023678
OHD 987046703
Hazardous Waste
Henry County

September 23, 1994

Mr. Herb Salsbury, Area Manager
Environmental Control
Box 311 State Route 110
Napoleon, Ohio 43545

Dear Mr. Salsbury:

On April 5, 1994, the Ohio Environmental Protection Agency (Ohio EPA) conducted a hazardous waste compliance evaluation inspection of Campbell Soup Company (Campbell's) located in Napoleon, Ohio. This inspection was conducted in order to determine Campbell's compliance with Ohio's hazardous waste generator regulations as adopted under Chapter 3745 of the Ohio Administrative Code (OAC).

During the inspection, violations of Ohio's hazardous waste regulations were noted. Campbell's was notified of these findings in a letter dated April 26, 1994. On May 4, 1994, Campbell's submitted a response to the Agency's Notice of Violation (NOV) containing a timetable for when actions were to be undertaken to return to compliance for the two cited violations. A second submission from Campbell's was received June 1, 1994. This communication included a proposal from Law Engineering and Environmental Services (Law) for the sampling of the area underlying coal pile which had ignitable hazardous wastes placed on it prior to January, 1993. The Agency responded to this submission in a letter dated June 16, 1994. On September 12, 1994, this office received a revised work plan for the soils underlying the coal pile to which solvent had previously been applied.

The work plan submitted by Law Engineering and Environmental Services appears to be adequate. Campbell's may proceed with the implementation of this work plan. The Agency requests notification at least 24 hours prior to sampling activities to allow an inspector to observe these activities.

If the pouring of solvents on the coal pile has impacted the underlying soil, closure of this area in accordance with OAC Rules 3745-66-11 through 3745-66-16 will be necessary. Campbell's compliance with respect to the closure requirements will be further evaluated after the analytical results are submitted to Ohio EPA, NWDO.

Printed on recycled paper
(revised 12/93)

The violation of ORC Section 3734.02 cited in the April 26, 1994 NOV remains outstanding until Campbell's can demonstrate that the application of solvent did not impact the soils underlying the coal pile.

Please be advised that failure to comply with applicable hazardous waste rules may be cause for enforcement action by this Agency pursuant to chapter 3734 of the Ohio Revised Code.

Failure to list specific deficiencies in this communication does not relieve you from the responsibility of complying with all applicable regulations.

If you have any questions, feel free to contact me.

Sincerely,

Michael R. Terpinski
Division of Hazardous Waste Management

RE: Campbell Soup Company
Hazardous Waste Henry County

Dear Mr. Terpinski:

Please find enclosed a copy of a revised Work Plan for the assessment of the soils beneath the coal pile and to determine the impact of placing the waste solvents on the coal pile prior to burning in the on-site boiler.

The revised plan was prepared in response to your letter of June 16, 1994 and represents a more focussed approach to the evaluation and the delineation of possible soil contamination in the affected area. As you requested, the analytical methods for testing the soil samples are USEPA Method 8240 for VOC's and USEPA Method 8270 for SVOC's.

We would appreciate letting us know if you have any further comments before we proceed with implementation of the plan.

Sincerely,

CAMPBELL SOUP COMPANY

Partial Return to Compliance

June 29, 1994

Mr. Herb Salsbury, Area Manager
Environmental Control
Box 311 State Route 110
Napoleon, Ohio 43545

Dear Mr. Salsbury:

On April 5, 1994, the Ohio Environmental Protection Agency (Ohio EPA) conducted a hazardous waste compliance evaluation inspection of Campbell Soup Company (Campbell's) located in Napoleon, Ohio. This inspection was conducted in order to determine Campbell's compliance with Ohio's hazardous waste generator regulations as adopted under Chapter 3745 of the Ohio Administrative Code (OAC).

During the inspection, violations of Ohio's hazardous waste regulations were noted. Campbell's was notified of these findings in a letter dated April 26, 1994. Campbell's responded to this NOV in letters dated May 4, 1994, June 1, 1994, and June 22, 1994. This letter serves to address Campbell's latest response and to appraise you of the current regulatory status of your facility.

The following violations of Ohio's hazardous waste rules were noted in the April 26, 1994 letter to Campbell's:

1. **Ohio Administrative Code (OAC) Rule 3745-65-33** Campbell's does not test all required spill control, decontamination, fire, and communications equipment in the main plant on a weekly basis.

   On June 22, 1994, this office received a copy of the weekly inspection log showing eight weeks' inspections of Campbell's fire extinguishers. *With this information, this violation is considered abated.*

2. **Ohio Revised Code (ORC) 3734.02(F)** Prior to January, 1993, Campbell's stored and treated ignitable hazardous wastes in a waste pile prior to burning in an on-site boiler without a hazardous waste installation and operation permit or a permit by rule, in violation of ORC section 3734.02(E)(F). Between twenty-two (22) and one hundred (100) gallons per month were poured on the pile and burned.

Campbell's was to obtain samples from beneath the coal pile where solvent was previously poured and from the area beneath the coal pile which was not impacted by this activity. On June 1, 1994, this office received a copy of the sampling strategy proposed by Law Engineering and Environmental Services. Comments to Law's proposed sampling strategy were supplied by the Agency in a letter dated June 16, 1994.

Campbell's is considered returned to compliance for OAC Rule 3745-65-33. The violation of ORC Section 3734.02(F) remains outstanding.

Please be advised that failure to comply with applicable hazardous waste rules may be cause for enforcement action by this Agency pursuant to chapter 3734 of the Ohio Revised Code.

Failure to list specific deficiencies in this communication does not relieve you from the responsibility of complying with all applicable regulations.

If you have any questions, feel free to contact me.

Sincerely,

Michael R. Terpinski

Hazardous Waste
Henry County

June 16, 1994

Mr. Herb Salsbury, Area Manager
Environmental Control
Box 311 State Route 110
Napoleon, Ohio 43545

Dear Mr. Salsbury:

On April 5, 1994, the Ohio Environmental Protection Agency (Ohio EPA) conducted a hazardous waste compliance evaluation inspection of Campbell Soup Company (Campbell's) located in Napoleon, Ohio. This inspection was conducted in order to determine Campbell's compliance with Ohio's hazardous waste generator regulations as adopted under Chapter 3745 of the Ohio Administrative Code (OAC).

During the inspection, violations of Ohio's hazardous waste regulations were noted. Campbell's was notified of these findings in a letter dated April 26, 1994. On May 4, 1994, Campbell's submitted a response to the Agency's Notice of Violation (NOV) containing a timetable for when actions were to be undertaken to return to compliance for the two cited violations. A second submission from Campbell's was received June 1, 1994. This communication included a proposal from Law Engineering and Environmental Services (Law) for the sampling of the area underlying coal pile which had ignitable hazardous wastes placed on it prior to January, 1993.

This letter serves to respond to your June 1, 1994 correspondence, and provide the current hazardous waste compliance status of your facility.

The following violations of Ohio's hazardous waste rules were noted in the April 26, 1994 letter to Campbell's:

1. **Ohio Administrative Code (OAC) Rule 3745-65-33** Campbell's does not test all required spill control, decontamination, fire, and communications equipment in the main plant on a weekly basis.

   Campbell's was to begin conducting weekly inspections and submit a copy of one month's inspections to OEPA, NWDO to demonstrate abatement of this violation. In our June 15, 1994 telephone conversation you indicated that this information will be sent soon.

2. **Ohio Revised Code (ORC) 3734.02(F)** Prior to January, 1993, Campbell's stored and treated ignitable hazardous wastes in a waste pile prior to burning in an on-site boiler without a hazardous waste installation and operation permit or a permit by rule, in violation of ORC section 3734.02(E)(F). Between twenty-two (22) and one hundred (100) gallons per month were poured on the pile and burned.

Printed on recycled paper
(revised 12/93)

Campbell's was to obtain samples from beneath the coal pile where solvent was previously poured and from the area beneath the coal pile which was not impacted by this activity. On June 1, 1994, this office received a copy of the sampling strategy proposed by Law Engineering and Environmental Services. The following comments are in response to Law's proposed sampling strategy:

a) Sampling of the area underlying the coal pile not impacted by the addition of solvents must be addressed. While there is mention of one soil boring being taken from the east side of the coal storage and mixing area for background characterization purposes, it is not clear whether this sample is to be taken as a background sample for the purpose of comparing the rest of the samples to the other coal pile or to virgin soil.

b) Prior to sampling, a sampling map must be submitted which shows the location of all sampling points for this event.

c) The analytical methods for testing soil samples are not stated in the sampling strategy. Campbell's must use USEPA Method 8240 for volatile organic chemicals (VOCs) and USEPA Method 8270 for semivolatile organic chemicals (SVOCs).

If the pouring of solvents on the coal pile has impacted the underlying soil, closure of this area in accordance with OAC Rules 3745-66-11 through 3745-66-16 will be necessary. Campbell's compliance with respect to the closure requirements will be further evaluated after the analytical results are submitted to OEPA, NWDO.

The violations cited in the April 26, 1994 NOV remain outstanding.

Please be advised that failure to comply with applicable hazardous waste rules may be cause for enforcement action by this Agency pursuant to chapter 3734 of the Ohio Revised Code.

Failure to list specific deficiencies in this communication does not relieve you from the responsibility of complying with all applicable regulations.

If you have any questions, feel free to contact me.

Sincerely,

Michael R. Terpinski
Division of Hazardous Waste Management

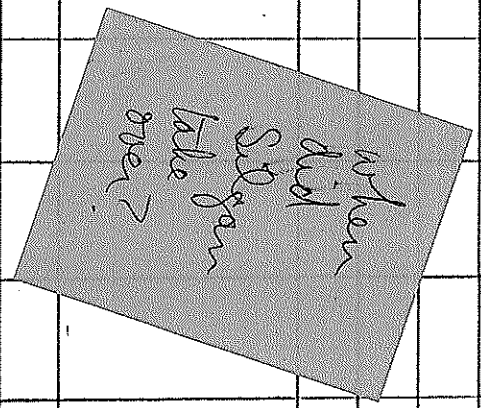
REMARKS - GENERAL INFORMATION



Include list of wastes being generated/managed at the site and a brief description of site activity and waste handling procedures:

Campbell's is a manufacturer of heat processed soups, sauces, pork + beans, + V-8 vegetable juice. Ten million cans of soup per day are produced at the Napoleon plant. Campbell's is a small quantity generator of hazardous waste. Wastes produced on-site include: still bottoms (D001), side stripe rust inhibitor (D001), ~~paint~~ thinner waste (D001). Other wastes which are occasionally generated include: MEK (F005), D+I sump pit sludge, (D001) waste compounds (D001). Before January of 1993, Campbell's poured the mineral spirits waste onto a coal pile + burned it for energy recovery. Records at Campbell's show this activity occurred from at least September of 1991, although Mr. Herb Salisbury of Campbell's said it (the burning) occurred over many years. The wastes are currently managed in a still on-site. The coal pile was located at the main plant.

GENERATOR CLASSIFICATION (OAC 3745-52-34)

Does the facility:

1. Generate < 100 Kg (25-30 gallons) of hazardous waste in a calendar month?

   (yes) _____ (no) _____

   If so, the facility is classified as a Conditionally Exempt Small Quantity Generator, unless 3.b. applies. Please complete the Conditionally Exempt Small Quantity Generator Requirements checklist.

2. Generate between 100 and 1000 Kg of hazardous waste in a calendar month? (about 25 to under 300 gallons)

   (yes) ✓ (no) _____

   If so, the facility is classified as a Small Quantity Generator, unless 3.b. applies. Please stop here and complete the Small Quantity Generator Requirements checklist.

3. a. Generate > 1000 Kg (~ 300 gallons) of hazardous waste in a calendar month?

   (yes) _____ (no) _____

   or;

   b. Generate > 1 Kg of acutely hazardous waste in a calendar month?

   (yes) _____ (no) _____

   If so, the facility is classified as a Large Quantity Generator. Please complete the Large Quantity Generator Requirements checklist.

REMARKS - GENERATOR CLASSIFICATION

SMALL QUANTITY GENERATOR (SQG) REQUIREMENTS

WASTE EVALUATION (OAC 3745-52-11) **Y/N/NA** **RMK #**

1. Have the wastes generated at the facility been evaluated as required under 3745-52-11? Y

   (a) Has the generator's evaluation identified in Question #1 included an evaluation for the (TC) Toxicity Characteristics identified in 3745-51-24? [3745-52-11(C)] Y

NOTE: The TC Rule requirement noted above must include an evaluation of the metal as well as organic TC constituents identified in 3745-51-24.

If not, please specify those waste(s) which the SQG has failed to provide an adequate evaluation of:

GENERATOR CLASSIFICATION

2. Do quantities of hazardous waste accumulated on-site exceed 6000 kgs? (If so, TSD standards apply. Complete applicable TSD checklists.) [3745-52-34(D) and (F)] NA

GENERATOR IDENTIFICATION NUMBER (OAC 3745-52-12)

3. Has the generator obtained an identification number from either US EPA or Ohio EPA as required under 3745-52-12 prior to treating, storing, disposing, transporting or offering hazardous waste for transport? Y

MANIFEST REQUIREMENTS (OAC 3745-52-20 TO 3745-52-23)

4. Are waste streams generated at the facility being reclaimed under a contractual agreement as defined in OAC 3745-52-20(F)? NA

If not, the generator is subject to manifest requirements of OAC 3745-52-20 through 3745-52-23. Please complete the **Manifest Requirements** checklist to document compliance with these requirements.

SQG - EMERGENCY PROCEDURES/PREPAREDNESS AND PREVENTION (OAC 3745-65-30 TO 3745-65-37) | **Y/N/NA** | **RMK #**

5. Is an emergency coordinator available at all times? [3745-52-34(D)(5)(a)] — Y

6. Has the following information been posted by the telephone? [3745-52-34(D)(5)(b)]:

   a. Name and telephone number of emergency coordinator? — Y

   b. Location of fire and spill control equipment? — Y

   c. Telephone number of local fire department? —

7. Have emergencies been reported to the National Response Center? [3745-52-34(D)(5)(d)] — NA

8. Are all employees thoroughly familiar with proper handling and emergency procedures? [3745-52-34(D)(5)(c)] — Y

In addition to the above, the small quantity generator must comply with the "Preparedness and Prevention" requirements of OAC 3745-65-30 through 3745-65-37. Please complete the **Preparedness and Prevention** checklist to document compliance with these requirements.

SQG - ACCUMULATION OF HAZARDOUS WASTES (OAC 3745-52-34)

9. Is the generator accumulating hazardous wastes in containers? If so, — Y

   a. Is the date accumulation began clearly marked on each container [3745-52-34(A)(2)]? — Y

   b. Is each container clearly marked with the words "Hazardous Waste" [3745-52-34(A)(3)]? — Y

In addition to the above, if the generator is accumulating hazardous waste in containers, please complete the **Management of Containers** checklist. If the Small Quantity Generator is operating a satellite accumulation area, the **Satellite Accumulation Area Requirements** portion of the checklist must also be completed.

10. Is the generator accumulating hazardous wastes in tanks? — NA

    a. If so, is each tank clearly marked with the words "Hazardous Waste" [3745-52-34(A)(3)]? — Y

In addition to the above, if the generator is accumulating hazardous waste(s) in tanks, please complete the **Accumulation in Tanks for SQG's** checklist.

	Y/N/NA	RMK #
11. Has the generator accumulated hazardous wastes in excess of 180 days (or 270 days if the waste must be transported more than 200 miles)? [3745-52-34(E)]	NA	
a. If so, has the generator been granted an extension by the Director for accumulation in excess of 180 (or 270) days?		

REMARKS - SMALL QUANTITY GENERATOR REQUIREMENTS

MANIFEST REQUIREMENTS (OAC 3745-52-20 TO 3745-52-23) **Y/N/NA RMK #**

1. Does the generator meet the following requirements with respect to the preparation, use and retention of the hazardous waste manifest:

   a. All hazardous wastes shipped off-site have been accompanied by a completed manifest, US EPA form 8700-22 in compliance with 3745-52-20(A)? — Y

   b. The manifest contains all information required by 3745-52-20 and the minimum number of copies required by 3745-52-22? — Y

   c. The generator has designated at least one permitted disposal facility and has/will designate an alternate facility or instructions to return waste in compliance with 3745-52-20(C)(D)(E)? — Y

   d. Prepared manifests have been signed by the generator and initial transporter in compliance with 3745-52-23 (A)(1)(2)? — Y

2. Has the generator received a return copy of each completed manifest within thirty-five (35) days of the date the waste was accepted by the initial transporter? — Y

   a. If not, has the generator complied with the manifest exception reporting requirements in 3745-52-42? —

NOTE: The manifest exception reporting requirement identified in Question #2 above is applicable to large quantity generators only. See Question #3 for manifest exception reporting requirements for small quantity generators.

3. If the generator is acting as a small quantity generator, (> 100 kg but < 1000 kg of hazardous waste in a calendar month) has the generator received a return copy of each completed manifest within sixty days of receipt by the initial transporter? [3745-52-42(B)] — Y

   a. If not, did the generator submit a legible copy of the manifest with some indication that the generator has not received confirmation of delivery to the Ohio EPA? [3745-52-42(B)] — NA

4. Are signed copies of all hazardous waste manifests and any documentation required for Exception Reports retained for at least 3 years as required by 3745-52-40? — Y — 1

1. Records are available starting 9/91. Prior to 9/91, solvents were burned in a boiler for energy recovery.

OAC 3745-58 USED OIL BURNED FOR ENERGY RECOVERY

	Y/N/NA	RMK #
1. Is used oil or used oil fuel being burned for energy recovery in a boiler or industrial furnace? [3745-58-50(A)]	Y	
2. Does the used oil contain more than 1000 ppm total halogens?	N	
If yes, it is regulated as a hazardous waste fuel under 3745-58. [3745-58-50(C)]		
3. Is the used oil a hazardous waste solely because it:		
a. Exhibits a characteristic identified under 3745-51? [3745-58-50(C)]	N/A	
b. Contains hazardous waste generated by Conditionally Exempt Small Quantity Generators only? [3745-58-50(D)]	N	

If either 3.a. or 3.b. is yes, the used oil is regulated as a used oil not a hazardous waste fuel.

4. Is the used oil classified as "off-specification" due to exceedances of any of the following allowable levels of constituents: [3745-58-50(E)]

Constituent	Allowable Level		
a. Arsenic	5 ppm maximum		<10
b. Cadmium	2 ppm maximum		<3
c. Chromium	10 ppm maximum		<2
d. Lead	100 ppm maximum 326	✓	326
e. Flash Point	100 degrees F minimum		>140
f. Total Halogens	4,000 ppm maximum		

WASTE COOLANT OIL

5. If the generator/marketer claims that used oil meets or exceeds specification, does the generator/marketer have analyses of used oil documenting that it meets/exceeds specification? [3745-58-53(B)(1)]	Y	
6. If the marketer is handling specification used oil, does he/she maintain an operating log containing the following information: [3745-58-53(B)(7)]		
a. Name and address of facility receiving the shipment?	NA	
b. Date of shipment or delivery?		
c. Cross-reference to the record of used oil analysis?		

	Y/N/NA	RMK #
7. Are used oil analyses and the operating log kept for a minimum of 3 years?	Y	

THE FOLLOWING QUESTIONS APPLY ONLY TO MARKETERS/BURNERS OF OFF-SPECIFICATION USED OIL FUEL:

8. Has the marketer filed a Notification or Re-notification of Hazardous Waste Activity with US EPA? [3745-58-53(B)(3)] and [3745-58-54(B)]	NA	
9. Has the burner of off-specification used oil notified US EPA of his/her used oil management activities (except for oil-fired space heaters described under 3745-58-51(B)(2)(c)? [3745-58-54(B)]	Y	
10. When the marketer initiates shipment of off-specification used oil, has he/she prepared and sent the receiving facility an invoice containing the following information: [3745-58-53(B)(4)]		
a. An invoice number?	NA	
b. The marketer's name, address, and US EPA I.D. No.?		
c. The receiving facility's name, address and US EPA I.D. No.?		
d. The quantity of off-specification used oil delivered?		
e. The date(s) of shipment or delivery?		
f. The statement "This used oil is subject to Ohio EPA regulation under Rules 3745-58-50 to 3745-58-54 of the Ohio Administrative Code?"		
11. Prior to initiating the first shipment of off-specification used oil, has the marketer obtained written notice certifying that recipients have notified US EPA (and if a burner will burn only in industrial furnaces or boilers)? [3745-58-53(B)(5)]	NA	
12. Before accepting shipments of off-specification used oil from other marketers, has the marketer certified that he/she has notified US EPA of the marketing activity? [3745-58-53(B)(5)]	NA	

	Y/N/NA	RMK #
13. Are copies of certifications, invoices and analyses maintained for 3 years? [3745-58-53(B); 3745-58-54(F)]	Y	
14. Has the burner certified to marketers from whom he/she receives off-specification oil that he/she has a US EPA I.D. No. and will only burn the used oil in an industrial furnace or boiler identified in 3745-58-51(B)? [3745-58-54(C)]	NA	

REMARKS - USED OIL BURNER/MARKETER REQUIREMENTS

PREPAREDNESS AND PREVENTION (OAC 3745-65-30 TO 3745-65-37) **Y/N/NA RMK #**

1. Is the facility operated to minimize the possibility of fire, explosion, or non-planned release of hazardous waste? [3745-65-31] Y

2. Has there been a fire, explosion or non-planned release of waste at the facility since date of last inspection? N

   a. If yes, was the contingency plan implemented? [3745-65-51(B)] Y

NOTE: Small quantity generators are not required to maintain a contingency plan. Question #2(a) is, therefore, not applicable to SQGs.

3. If required due to actual hazards associated with the waste, does the facility have the following equipment: [3745-65-32(A)(B)(C)(D)]

   a. Internal alarm system? Y

   b. Access to telephone, radio or other device for summoning emergency assistance? Y

   c. Portable fire control equipment, spill control and decontamination equipment? Y

   d. Water of adequate volume and pressure via hoses, sprinkler, foamers or sprayers? Y

4. Is all required spill control and decontamination equipment, fire and communications equipment tested on a weekly basis and maintained as necessary? [3745-65-33] N 1

   a. Does the facility keep an equipment testing log required by 3745-65-33(B), including date and time of test, name of person conducting the test, observations made, and date and nature of any repairs? Y

5. If required due to the actual hazards associated with the waste, do personnel have immediate access to an emergency communication device during times when hazardous waste is being physically handled? [3745-65-34] Y

6. If required due to the actual hazards associated with the waste, is adequate aisle space maintained to allow unobstructed movement of emergency or spill control equipment? [3745-65-35] Y

	Y/N/NA	RMK #
7. If required due to the actual hazards associated with the waste, has the facility attempted to make appropriate arrangements with local authorities to familiarize them with possible hazards and facility layout? [3745-65-37(A)]	Y	
8. Where state and local emergency service authorities have declined to enter into any proposed special arrangements or agreements, has the refusal been documented? [3745-65-37(B)]	NA	

REMARKS - CONTINGENCY PLAN/PREPAREDNESS AND PREVENTION REQUIREMENTS

1. Equipment tested monthly.

USE AND MANAGEMENT OF CONTAINERS (OAC 3745-66-70 TO 3745-66-77)	Y/N/NA	RMK #
1. Are hazardous wastes stored in containers which are:		
a. Closed? [3745-66-73(A)]	Y	
b. In good condition? [3745-66-71]	Y	
c. Compatible with wastes stored in them? [3745-66-72]	Y	
2. Are containers stored closed except when it is necessary to add or remove wastes? [3745-66-73(A)]	Y	
3. Are hazardous waste containers stored, handled and opened in a manner which prevents container rupture or leakage? [3745-66-73(B)]	Y	
4. Is the area where containers are stored inspected for evidence of leaks or corrosion at least weekly? [3745-66-74]	Y	
5. Is the facility recording inspections described in Question #4 in an inspection log or inspection summary as required by OAC 3745-66-74(B) which contains the following information:		
a. Date and time of inspections?	Y	
b. Name of inspector?	Y	
c. Notation of observations made during the inspection?	Y	
d. The date and nature of any repairs or other remedial action?		
6. Are ignitable and/or reactive hazardous waste(s) being managed at the facility? If so,	Y	
a. Are containers holding ignitable or reactive waste located at least 50 feet (15 meters) from the facility's property line? [3745-66-76]		
b. Are containers holding hazardous wastes stored separately from other materials which may interact with the waste in a hazardous manner? [3745-66-77(C)]		

NOTE: Small Quantity Generators are not required to comply with OAC Rule 3745-66-67 (except for wastes being accumulated in satellite accumulation areas). [See OAC Rules 3745-52-34(D)(2) and (C)(1)(a)]

OAC CHAPTER 3745-59 - LDR GENERAL REQUIREMENTS

CASE-BY-CASE EXTENSIONS	Y/N/NA	RMK#
1. Has the entity received an extension for compliance with land disposal restrictions from US EPA pursuant to 40 CFR 268.5? If yes,	NA	
(a) List the waste(s) affected:		
(b) Has the extension been recognized by the Director of Ohio EPA? [O.A.C. Rule 3745-59-05(C)]		
(c) When does the extension expire? _____		

NOTE: A case-by-case extension can be granted for up to one year. The extension is renewable once (by US EPA) for an additional year. Until receiving approval of the extension by US EPA and recognition of the extension by the Director of Ohio EPA, the entity must continue to manage the waste in accordance with all applicable LDR requirements.

VARIANCE FROM A TREATMENT STANDARD		
2. Has the entity been granted a variance from a treatment standard by US EPA pursuant to 40 CFR 268.44? If yes,	NA	
(a) List the waste(s) affected:		
(b) Has the variance been recognized by the Director of Ohio EPA? [O.A.C. Rule 3745-59-44(C)]		

NOTE: Until the variance has been approved by US EPA and recognized by the Director of Ohio EPA, the entity must continue to manage the waste in compliance with the LDR requirements.

NO MIGRATION PETITION | **Y/N/NA** | **RMK#**

3. Has the entity received a variance from US EPA to allow for continued land disposal of untreated LDR wastes based upon a demonstration that there will be no migration from the disposal unit pursuant to 40 CFR 268.6? If yes, NA

   (a) List the waste(s) affected:

   (b) Has the entity's "no migration" demonstration been recognized by the Director of Ohio EPA? [O.A.C. Rule 3745-59-06(C)]

NOTE: Until the no migration petition has been approved by US EPA and recognized by the Director of Ohio EPA, the entity must continue to manage the waste in compliance with the LDR requirements.

PROHIBITION AGAINST DILUTION

4. Does the entity dilute a restricted waste or a treatment residue from a restricted waste: [O.A.C. Rule 3745-59-03; 40 CFR 268.3]

   (a) As a substitute for adequate treatment to achieve compliance with LDR treatment standards? NA

   (b) To circumvent the effective date of a prohibition (e.g. to dilute a "non-wastewater" waste to a "wastewater" to avoid complying with the "non-wastewater" treatment standard)?

   (c) To otherwise avoid a prohibition in O.A.C. Rules 3745-59-30 through 3745-59-35 (40 CFR 268.30 through 268.35)?

   (d) To otherwise avoid a prohibition imposed by Section 3004 of RCRA?

NOTE: If the answer to any of the Questions 4(a) through 4(d) above is yes, the entity is impermissibly diluting a restricted waste and is in violation of O.A.C. Rule 3745-59-03 (40 CFR 268.3).

NOTE: Dilution of wastes is permissible under some conditions. See O.A.C. Rule 3745-59-03(B) (40 CFR 268.3) and the Third Third final rule preamble for additional information.

LDR - GENERATOR REQUIREMENTS

NOTE: The following requirements apply only to large quantity generators and small quantity generators. Conditionally exempt small quantity generators are exempt from land disposal restriction requirements as referenced in O.A.C. Rules 3745-59-01(E)(1) (40 CFR 268.1(e)(1)) and 3745-51-05(B) (40 CFR 261.5(b)).

EVALUATION OF WASTES/DETERMINING APPROPRIATE TREATMENT STANDARDS	**Y/N/NA**	**RMK#**
1. Has the generator adequately evaluated all wastes to determine if they are restricted from land disposal? [O.A.C. Rule 3745-59-07(A); 40 CFR 268.7(a)]	Y	
(a) **For determinations based solely on knowledge of the waste:** Is supporting data used to make this determination being retained on-site? [O.A.C. Rule 3745-59-07(A)(5); 40 CFR 268.7(a)(5)]	Y	
(b) **For determinations based upon analytical testing:** Is a copy of waste analysis data being retained on-site? [O.A.C. Rule 3745-59-07(A)(5); 40 CFR 268.7(a)(5)]	Y	
2. Has the generator determined the correct "treatability group" for each waste restricted from land disposal (e.g. wastewater, non-wastewater, high arsenic, low arsenic, high zinc, low zinc, etc.)? [O.A.C. Rule 3745-59-07(A); 40 CFR 268.7(a)]	Y	
3. Has the generator correctly determined if restricted wastes meet or exceed treatment standards? [O.A.C. Rule 3745-59-07(A); 40 CFR 268.7(a)]	Y	
4. Does the entity generate any listed waste(s) which are restricted from land disposal? If so,	Y	
(a) Do such wastes also exhibit hazardous waste characteristics as identified in O.A.C. Rules 3745-51-20 to 3745-52-24? (40 CFR 261.20 through 261.24)?	NA	
(b) **For listed wastes which also exhibit a characteristic:** Does the generator also identify the appropriate treatment standard for the constituent(s) which cause the waste to exhibit the characteristic(s)? [O.A.C. Rule 3745-59-09(A); 40 CFR 268.9(a)]		

NOTE: The generator is not required to identify the treatment standard for the characteristic if the listing covers the associated characteristic (e.g. a F019/D007 hazardous waste - F019 being listed due to chromium content and D007 being the characteristic waste code for chromium). [See O.A.C. Rule 3745-59-09(B); 40 CFR 268.9(b)]

TREATMENT OF CHARACTERISTIC HAZARDOUS WASTE	Y/N/NA	RMK#
5. Does the generator treat characteristic hazardous waste(s) in a RCRA-exempt unit to render such wastes non-hazardous?	NA	
(a) If so, are treated waste(s) sent to a licensed solid waste disposal facility?		
i. If so, with each shipment of waste, does the generator submit a notification and certification to the Regional Administrator/Director which contains the following:		
a. Name and address of the facility receiving the waste? [O.A.C. Rule 3745-59-09(D)(1)(a); 40 CFR 268.9(d)(1)(i)]		
b. A description of the waste as initially generated, including EPA hazardous waste numbers and treatability group? [O.A.C. [Rule 3745-59-09(D)(1)(b); 40 CFR 268.9 (d)(1)(ii)]		
c. The treatment standards applicable to the waste at the initial point of generation? [O.A.C. Rule 3745-59-09(D)(1)(c); 40 CFR 268.9(d)(1)(iii)]		
ii. Is the certification signed by an authorized representative and does it contain the language in O.A.C. Rule 3745-59-07(B)(5)(a) (40 CFR 268.7 (b)(5)(i)? [O.A.C. Rule 3745-59-09(D)(2); 40 CFR 268.9(d)(2)]		

NOTE: An example of a RCRA-exempt unit would include an elementary neutralization unit or a wastewater treatment unit as defined by O.A.C. Rule 3745-50-10. [See O.A.C. Rule 3745-65-01]

REMARKS

NOTIFICATION/CERTIFICATION	Y/N/NA	RMK#

6. **For wastes that do not meet treatment standards:** Does the generator notify the treatment/storage facility receiving the wastes, in writing, that wastes being received do not meet treatment standards? [O.A.C. Rule 3745-59-07(A)(1); 40 CFR 268.7(a)(1)]

   Y

   If so, does the notification include the following:

   (a) EPA hazardous waste number? [O.A.C. Rule 3745-59-07(A)(1)(a); 40 CFR 268.7(a)(1)(i)]

   (b) Appropriate treatment standard for the waste? [O.A.C. Rule 3745-59-07(A)(1)(b); 40 CFR 268.7(a)(1)(ii)]

   (c) The manifest number associated with the shipment of waste? [O.A.C. Rule 3745-59-07(A)(1)(c); 40 CFR 268.7(a)(i)(iii)]

   (d) Waste analysis data, where available? [O.A.C. Rule 3745-59-07(A)(1)(d); 40 CFR 268.7(a)(1)(iv)]

7. Is the notification identified in Question #6 submitted with each shipment of waste? [O.A.C. Rule 3745-59-07(A)(1); 40 CFR 268.7(a)(1)]

   Y

8. **For wastes that meet treatment standards:** Does the generator submit a written notice and certification to the treatment, storage or disposal facility receiving the wastes stating wastes being received meet applicable treatment standards? [O.A.C. Rule 3745-59-07(A)(2); 40 CFR 268.7(a)(2)]

   NA

   If so, does the notice/certification include the following:

   (a) EPA hazardous waste number? [O.A.C. Rule 3745-59-07(A)(2)(a)(i); 40 CFR 268.7(a)(2)(i)(A)]

   (b) The corresponding treatment standards and applicable prohibitions for the waste? [O.A.C. Rule 3745-59-07(A)(2)(a)(ii); 40 CFR 268.7(a)(2)(i)(B)]

   (c) The manifest number associated with the shipment of waste? [O.A.C. Rule 3745-59-07(A)(2)(a)(iii); 40 CFR 268.7(a)(2)(i)(C)]

   (d) Waste analysis data, where available? [O.A.C. Rule 3745-59-07(A)(2)(a)(iv); 40 CFR 268.7(a)(2)(i)(D)]

   (e) Is the certification signed by the generator or an authorized representative? [O.A.C. Rule 3745-59-07(A)(2)(b); 40 CFR 268.7(a)(2)(ii)]

	Y/N/NA	RMK#
9. Is the notification/certification identified in Question #8 submitted with each shipment of waste? [O.A.C. 3745-59-07 (A)(2); 40 CFR 268.7(a)(2)]	NA	
10. **For wastes subject to a case-by-case extension, exemption or a variance:** Does the generator provide written notice to the facility receiving the waste that the waste is not prohibited from land disposal? [O.A.C. Rule 3745-59-07 (A)(3); 40 CFR 268.7(a)(3)]	NA	
If so, does the notice contain the following information:		
(a) EPA hazardous waste number? [O.A.C. Rule 3745-59-07 (A)(3)(a); 40 CFR 268.7(a)(3)(i)]		
(b) The corresponding treatment standard and applicable prohibitions? [O.A.C. Rule 3745-59-07(A)(3)(b); 40 CFR 268.7(a)(3)(ii)]		
(c) The manifest number associated with the shipment of waste? [O.A.C. Rule 3745-59-07(A)(3)(c); 40 CFR 268.7(a)(3)(iii)]		
(d) Waste analysis data, where available? [O.A.C. Rule 3745-59-07(A)(3)(d); 40 CFR 268.6(a)(3)(iv)]		
(e) The date the waste is subject to the prohibitions? [O.A.C. Rule 3745-59-07(A)(3)(e); 40 CFR 268.7(a)(3)(v)]		
11. Does the generator retain on-site a copy of all notices, certifications, demonstrations and waste analysis data for at least five years? [O.A.C. Rule 3745-59-07(A)(6); 40 CFR 268.7(a)(7)]	Y	1

REMARKS

1. Prior to '91, no records exist because waste was placed on a coal pile + burned in a boiler.

RE: Campbell Soup Company
Hazardous Waste Henry County

Dear Mr. Terpinski:

Please find enclosed a copy of a proposal from Law Engineering, Inc. for the assessment of the soils beneath the coal pile and to determine the impact of placing the waste solvents on the coal pile prior to burning in the on-site boiler.

This proposal is submitted for your review and comments as indicated in our letter of May 2, 1994 in response to the Notice of Violation of May 26, 1994. We will proceed with the implementation of the sampling plan immediately after we receive your comments.

Please let me know if any further information is requred.

Sincerely,

CAMPBELL SOUP COMPANY

Attention: Dr. Osman M. Aly
Director of Environmental Affairs

Subject: **Proposal -**
Phase II Environmental Site Assessment
Campbell Soup Company Napoleon Plant / Coal Stockpile Area
Napoleon, Ohio
Law Engineering Proposal No. CIN.94.671

Dear Mr. Aly:

As requested, Law Engineering, Inc. (LAW), an Ohio Certified Corporation (Certification No. 775832; expiration dated 6-30-94) is pleased to present this proposal to perform a Phase II environmental site assessment at the above referenced site located at the Campbell Soup Company's Napoleon Plant in Napoleon, Ohio.

BACKGROUND

The subject facility is a soup production and canning complex. This assessment is being performed in response to a notice of violation presented to the Campbell Soup Company by Ohio Environmental Protection Agency (EPA). The Ohio EPA alleges that certain contamination of surface soils in the area adjacent to the power plant may have occurred as a result of mixing spent solutions with coal prior to burning. This area is approximately one acre of land on the south and west sides of the power plant. The eastern portion of the mixing area is paved with concrete.

Solvents mixed with coal prior to burning include "O Thinner" and "F Thinner". These solvents are used to clean coatings used during the can production.

On May 16, 1994 Mr. Daniel Elliott and Mr. Jeffrey Hunt of Law Companies met with Dr. Aly, Mr. Richard Mahnke, and Mr. Mike Maringer of Campbell Soups at the site. The purpose of the visit was to prepare a scope of work for the space to perform the assessment and to review the site conditions.

We understand that the notice of violation applies to the period after January, 1993.

SCOPE OF SERVICES

The scope of our Phase II environmental site is summarized as follows:

- Prepare a site-specific safety plan & work plan to be submitted to Ohio EPA for approval prior to site activities.
- Drill and sample 16 hand-auger borings after removal of coal by Campbell Soup personnel.
- Perform laboratory analysis for specific compounds on selected soil samples
- Submit an assessment report documenting the work performed and present our conclusions and recommendations regarding the sites.

A description of our assessment tasks is presented as follows:

Site Safety Plan

We will prepare a work plan and a site specific safety plan in substantial accordance with the Ohio EPA document - Closure Plan Review Guidance dated May 1, 1991. The workplace will include LAW's procedures to obtain, collect and transport soil samples collected during site assessment activities.

Our site specific safety plan will outline the known chemical and workplace hazards as well as outline precautions and safety procedures which will be followed during the field work.

Test Boring Construction

A total of 16 hand auger soil borings will be drilled at the subject site along three radial grid lines which are intended to represent the path of the backhoe operator when the solvents are mixed in the coal piles. Fifteen samples will be taken at approximate 25 feet intervals along the radial lines as follows:

- Nine 3-feet deep borings will be advanced along the three radial lines at separate locations across the subject site. Samples will be collected at a depth of 1 and 3 feet.

- Six 5-feet deep borings will be advanced between shallow borings at alternate locations (second and fourth) along the radial lines.

In addition we will advance one 5-feet deep boring near the east side of the coal storage and mixing area as a background sample.

The borings will be drilled with hand auger equipment. The samples will be retained in clean, brass sleeves that will be capped with plastic ends, labeled and placed into a chilled ice chest, then transported to a state-certified laboratory for analysis. The appropriate Chain-of-Custody documentation will accompany the samples at all lines.

Hand-auger, soil samplers, and brass sampling sleeves will be washed prior to use, and between sampling intervals using the standard EPA three bucket wash/rinse.

Upon completion, the borings will be backfilled with native soil.

Laboratory Analysis

Selected soil samples will be analyzed for the target compounds addressed in the Notice of Violation (NOV) dated April 26, 1994. We have included in our opinion of cost the analysis of 21 soil samples for alcoholes by direct injection into the Flame Ionization Detector (FID). The alcoholes of interest are 2 - Butoxy Alcohol, Cylochexanol and Isobutyl alcohol. Standards for these compounds will be generated prior to the analyses.

An additional 21 soil samples will potentially be analyzed by EPA methods 3810/8015M using a standard created by a sample of the Shell 135 supplied by Campbell Soup Company.

Data Evaluation and Report Preparation

We will summarize the findings of our Phase II assessment work in a written report that will contain field observations, laboratory data, and our conclusion and recommendations.

The report will contain copies of laboratory analytical data, Chain-of-Custody documentation, as well as site sketches, and other graphics as needed.

PROPOSED SCHEDULE

Field work can begin within five to ten days of receiving your written authorization. We anticipate that we can complete our field work in two days. Laboratory analyses

will be available from the laboratory two to three weeks after completion of field work. Our report will be completed within one to two weeks after the receipt of the laboratory results.

FEES

The fee for our services will be based on the rates given in the attached Environmental Services Fee Schedule. We estimate the cost of the above services will be approximately A breakdown is presented in the attached Table A. We will not exceed this amount without your prior approval. We will invoice monthly as work progresses.

AUTHORIZATION

To authorize us to proceed with the proposed services and to make this proposal, our statement of Terms and Conditions, and other enclosures the agreement between us, please execute the attached Proposal Acceptance Sheet and return the acceptance copy to us. Any exceptions to this proposal or special requirements not covered in the proposal should be listed on the Proposal Acceptance Sheet.

We appreciate the opportunity to submit this proposal. If you have any questions regarding its contents, please contact us. We look forward to working with you on this and future projects.

RE: Campbell Soup Company
Hazardous Waste Henry County

Dear Mr. Terpinski:

This is in response to your letter of April 26, 1994 concerning the violations observed during the hazardous waste compliance evaluation inspection of Campbell Soup Company (Campbell) plant in Napoleon, Ohio conducted on April 5, 1994.

The following are the courses of actions to be undertaken for compliance with each of the two violations:

1. Campbell has already started testing all the emergency equipment in the hazardous waste management areas on a weekly basis with logs maintained in accordance with Ohio Administrative Code Rule 3745-65-33. Campbell will submit a copy of one month's inspections to OEPA, NWDO.

2. The following are the actions and timetables necessary for compliance of the violation resulting from placing the spent solvents onto the coal pile prior to burning in the on-site boiler:

1. Campbell will retain a qualified environmental consulting firm for the development of the sampling plan for the soil beneath the coal pile where the solvents were previously poured and from the area which was not impacted by this activity. This action will be completed by May 30, 1994.

2. The sampling plan will be reviewed with your office and will be subsequently immediately implemented. The timetable for this action and receiving the report with analytical results will be forwarded to your office as soon as it becomes available.

3. Any area where the soil may have been impacted will be closed in accordance with OAC Rules 3745-66-11 through 3745-66-16 after further review with your office.

Please let me know if any further information is required.

Sincerely,

CAMPBELL SOUP COMPANY

OHD 987046703
Hazardous Waste
Henry County

April 26, 1994

Mr. Herb Salsbury, Area Manager
Environmental Control
Box 311 State Route 110
Napoleon, Ohio 43545

Dear Mr. Salsbury:

On April 5, 1994, the Ohio Environmental Protection Agency (Ohio EPA) conducted a hazardous waste compliance evaluation inspection of Campbell Soup Company (Campbell's) located in Napoleon, Ohio. This inspection was conducted in order to determine Campbell's compliance with Ohio's hazardous waste generator regulations as adopted under Chapter 3745 of the Ohio Administrative Code (OAC). Campbell's was represented by Michael Maringer, John Gerding, Carolyn Oberhaus, David Alvord, and yourself. The Ohio EPA was represented by Gary Deutschman and the writer. The Agency's inspection included a tour of your facility and a review of written documentation.

Campbell's is a manufacturer of heat processed soups, sauces, pork and beans, and V-8 vegetable juice. The V-8 vegetable juice is manufactured at a separate plant located across the street from the main plant. Hazardous wastes produced on-site include: mineral spirits still bottoms (D001), side stripe rust inhibitor (D001) and thinner waste (D001). Other wastes which are generated occasionally include: methyl ethyl ketone (F005), D & I sump pit sludge (D001) and waste compound (D001). At the time of the inspection, Campbell's was operating as a small quantity generator of hazardous waste and a burner of waste oil.

During the inspection, the following violations of Ohio's hazardous waste rules were observed and noted:

1. **Ohio Administrative Code (OAC) Rule 3745-65-33** Campbell's does not test all required spill control, decontamination, fire, and communications equipment in the main plant on a weekly basis.

   Campbell's currently tests emergency equipment on a monthly basis. Emergency equipment in hazardous waste management areas must be tested weekly, with logs maintained in accordance with OAC Rule 3745-65-33(B). To demonstrate abatement of this violation, Campbell's must begin conducting weekly inspections and submit a copy of one month's inspections to OEPA, NWDO.

Prior to January, 1993, Campbell's ignitable wastes were poured onto a coal pile located on the grounds of the main plant and burned in a boiler for energy recovery. This waste was primarily D001 hazardous waste mineral spirits, although some enamels were also burned. This activity lasted from at least September, 1991 through January, 1993 (according to records kept at the facility's boiler house), although you stated during the Agency's interview that the practice of burning waste solvents in the boiler had occurred for "many years".

As a result of placing hazardous waste solvents into a coal pile prior to burning in an on-site boiler, Campbell's is in violation of the following:

2. **Ohio Revised Code (ORC) 3734.02(F)** Prior to January, 1993, Campbell's stored and treated ignitable hazardous wastes in a waste pile prior to burning in an on-site boiler without a hazardous waste installation and operation permit or a permit by rule, in violation of ORC section 3734.02(E)(F). Between twenty-two (22) and one hundred (100) gallons per month were poured on the pile and burned.

   Campbell's must obtain samples from beneath the coal pile where solvent was previously poured and from the area beneath the coal pile which was not impacted by this activity. If the pouring of solvents on the coal pile has impacted the underlying soil, closure of this area in accordance with OAC Rules 3745-66-11 through 3745-66-16 will be necessary. Campbell's compliance with respect to the closure requirements will be further evaluated after the analytical results are submitted to OEPA, NWDO.

Please be advised that failure to comply with applicable hazardous waste rules may be cause for enforcement action by this Agency pursuant to chapter 3734 of the Ohio Revised Code.

Please respond, in writing, to this Notice of Violation (NOV) within ten (10) days. Your response must include all actions and timetables necessary to demonstrate compliance.

Failure to list specific deficiencies in this communication does not relieve you from the responsibility of complying with all applicable regulations.

A copy of the completed inspection form is enclosed for your review. If you have any questions, feel free to contact me.

Sincerely,

Michael R. Terpinski
Division of Hazardous Waste Management

Attention: Dr. Osman M. Aly
Director of Environmental Affairs
Campbell Soup Company

We are pleased to submit our "Final Phase II Environmental Site Assessment, Campbell Soup Plant, Napoleon, Ohio for Campbell Soup Company." The purpose of our assessment was to determine if the pouring of solvents on the coal pile has impacted the underlying soil. Based on our assessment the soils beneath the coal pile do not appear to be impacted by the target solvent compounds.

We appreciate the opportunity to work with you on this project. Please call us if you have any questions or if we may be of further service.

Respectfully submitted,

EXECUTIVE SUMMARY

Campbell Soup Company has engaged Law Engineering, Inc., an Ohio Certified Corporation (Certificate No. 95-522; expiration date 6/30/95) to perform a Phase II Environmental Site Assessment of the coal stock pile at the Campbell Soup Plant in Napoleon, Ohio. The coal stock pile consists of about one acre of land used for the boiler coal supply. The surrounding properties are generally industrial and agricultural.

Five hand auger borings were drilled in the coal stock pile area on the southeast side of the plant boiler complex. Soil samples were collected at depths of one feet and 4.5 feet below the coal/clay interface. Semivolatile organic compounds and volatile organic compounds, with the exception of acetone, were not detected in the borings. Acetone was present in low concentrations in all the borings, however, based on the low concentrations detected, the acetone is considered to be a laboratory contaminant.

Based on our subsurface assessment, it does not appear that the pouring of spent solvents of the coal stock pile has impacted the underlying soils. The comparison of the material Safety and Data Sheets for the solvents poured on the coal pile and the laboratory test results does not indicate the presence of any of these target compounds.

1.0 INTRODUCTION

Law Engineering, Inc., an Ohio Certified Corporation (Certificate No. 95-522; expiration date 6/30/95) has performed a subsurface assessment of the coal stock pile at the Campbell Soup Plant in Napoleon, Ohio (Fig 1, Location Map). Our services were performed in general accordance with our proposal No. CIN.94.671, dated May 25, 1994 and subsequent telephone conversations with Dr. Osman M. Aly of Campbell Soup Company. Our services were authorized by Mr. D.B. Thompson of Campbell Soup Company on June 23, 1994, according to your amended Purchase Order No. 004-94170.

2.0 PURPOSE, SCOPE, AND REPORT FORMAT

2.1 PURPOSE

The purpose of the limited subsurface assessment was to determine if the pouring of spent solvents on the boiler coal supply has impacted the underlying soils.

2.2 SCOPE OF SERVICES

Our scope of services are being performed in response to a Notice of Violation presented to Campbell Soup Company by the Ohio Environmental Protection Agency (EPA) dated April 26, 1994 and the subsequent letters dated June 16, 1994 and September 23, 1994. Our services included the hand augering five, five-feet-deep borings at the coal stock pile, and the collections and chemical analyses of 10 soil samples. Four borings were located in known areas where solvents historically were poured and one boring was located where no solvents were poured. The boring located in the area where no solvents were poured will be used as a background comparison for the samples obtained from the borings where solvents were poured.

3.0 SUBSURFACE ASSESSMENT

On October 11, 1994, James M. DeLano, an engineer from our Cincinnati Ohio office, hand augured the five borings and collected the undisturbed soil samples at the coal stock pile area. Figure 2, Boring Location Map, shows the approximate locations of the borings. The borings were located using a 100-foot tape and compass from the corner of the boiler building and other known landmarks. The five borings are designated AB-1 to AB-5. AB-1 was augured in the area where no solvents were historically poured. AB-2 to AB-5 were drilled in the area where solvents were known to be poured. The materials encountered in these borings were logged using the Unified Soil Classification System. Appendix A. Boring Logs, comprises the boring logs.

A backhoe was used to excavate through the coal and to expose native material. Soil samples were then collected at a depth of one foot and 4.5 feet below the coal/soil interface. The coal/soil interface was designated as the elevation where coal particles were no longer observed to be present in clay. The thickness of the intermixed coal and clay were varied from 6 to 12 inches. The individual Boring Logs (Appendix A) contain the thickness of this layer in each auger boring. For the purpose of this assessment, the beginning of the olive-gray colored clay was designated as the "zero" reference for the sample depth. The Boring Logs indicate the depths from the coal surface where the samples were obtained. The samples were collected in clean brass sleeves contained in a bore barrel sampler. After the sample is retrieved, the ends of the brass sleeves were covered with Teflon tape and capped with a plastic cap. The samples were numbered, labeled, and placed in a chilled ice chest for transport to an Ohio certified laboratory for analyses. Between taking each sample, the sampler was decontaminated with Alconox and rinsed in tap water and two separate rinses. After the samples were collected, the borings were backfilled with sand.

3.1 FIELD OBSERVATIONS

Our field observations indicate that the native material consists of an olive/gray silty clay trending to a mottled brown and gray silty clay. Water was encountered in borings AB-3 to AB-5. In auger boring AB-5, groundwater was encountered at a depth of 6 feet below the coal surface during augering. Water was present in the bottom of auger borings AB-3 and AB-4. The amount present was 2 inches in auger borings AB-3 and 3 inches auger in AB-4. About 6 inches of water was present in auger boring AB-5. The amount of water present in the auger borings indicates the amount measured in the bottom of the hole. The water encountered in the borings is being interpreted as run-off present at the soil/coal interface. This water is being interpreted an not being associated with the regional groundwater in the vicinity of the site.

Before drilling began, an organic vapor analyzer (OVA) had been calibrated to 1000 ppm with a methane standard. Portions of the auger cuttings were placed in sealable bags and allowed to volatilize prior to the screening. OVA screening were performed on auger cuttings from the borings at a depth of one feet below the soil/coal interface. OVA readings on the samples ranged from 0 to 5 meter deflection units (mdus).

3.2 LABORATORY RESULTS

The soil samples were transferred to Environmental Chemical Corporation in Cincinnati, Ohio, a hazardous materials testing laboratory, under appropriate chain-of-custody and protocol. Appendix B, Analytical Laboratory Results, contains the laboratory reports and QA/QC documents. The soil samples were analyzed for volatile organics by EPA Method 8240 and semi-volatile organics by EPA method 8270. Laboratory analysis of the soil samples did not detect the presence of semi-volatile organic compounds. No volatile organic compounds were detected with the exception of low concentrations of acetone. The acetone was detected in all borings, including the background boring, with the concentrations ranging from 15.8 to 110 micrograms/kilogram (ug/kg). The detected acetone is considered a laboratory contaminant.

4.0 GEOLOGY AND HYDROGEOLOGY

The geology and hydrogeology of the site was assessed using the following information:

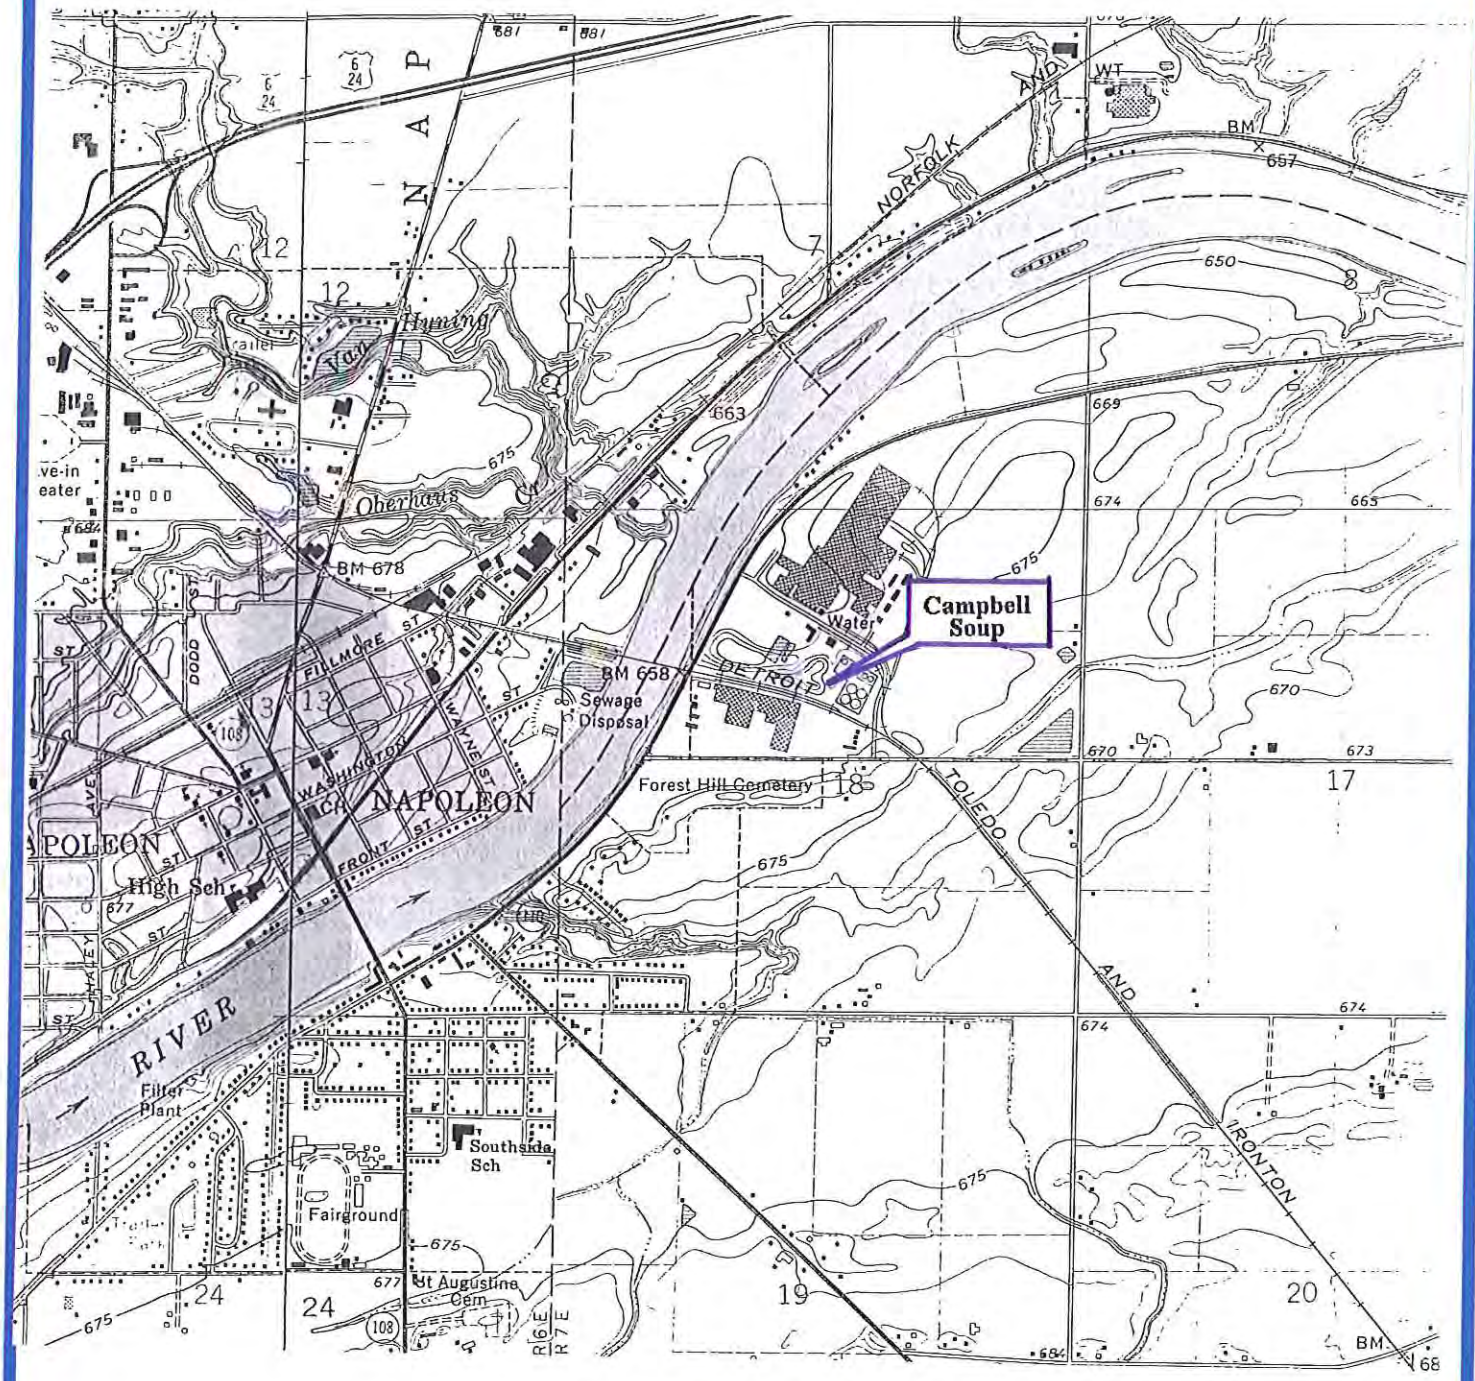
- Soil Survey of Henry County, Ohio, U.S. Department of Agriculture Soil Conservation Service, issued November, 1974.
- Geologic Map of Ohio, Ohio Department of Natural Resources, dated 1981.
- U.S. Geologic Survey (USGS) Topographic Map, Napoleon East, Ohio quadrangle, dated 1960, photorevised 1971 and photoinspected 1977.
- U.S. Geologic Survey (USGS) Topographic Map, Napoleon West, Ohio quadrangle, dated 1956, photorevised 1971.
- Top of Rock Map of Henry County, Ohio, Ohio Department of Natural Resources Division of Geological Survey, dated February 1988.
- Drift Thickness Map of Henry County, Ohio, Ohio Department of Natural Resources Division of Geological Survey, dated February 1988.
- Ground Water Resources Map of Henry County, Ohio, Ohio Department of Natural Resources Division of Water Resources , dated 1981.

4.1 REGIONAL GEOLOGY

The geology at the site is dominated by the Maumee River. The area of the property over geologic time has been subject to two periods of glacian. The glacial drift (glacial till) underlying the site is about 50 feet in thickness in the vicinity of the site. Underlying the glacial drift is a Devonian age bedrock formation known as the Ohio Shale formation.

4.2 REGIONAL GROUND WATER

Ground water beneath the site occurs in the thin layers of sand and gravel interbedded in the silty glacial clays. Well logs obtained from the Ohio Department of Natural Resources



indicate static water level depths ranging from 20 to 30 feet within about 3/4 mile radius of the site. Based on a review of this information, the ground water gradient in the vicinity of the site is probably to the west. Typically the ground water in the Napoleon area is used for single family residential uses and for irrigation purposes. The municipal water supply for the City of Napoleon is from the Maumee River.

4.3 SITE-SPECIFIC SOILS CONDITION

In general, the soils in the area of the coal stock pile consist of clay soils. The soils varied from an olive-gray silty clay trending to a light brown silty clay with pebbles and limestone fragments. These soil conditions were encountered in all the borings. Crushed coal was present to a depth of about 2 to 3 feet across the site. Underlying the coal, there was approximately 6 to 12 inches of an intermixed coal and clay layer. Underlying this layer, the olive-gray colored clay was encountered. Below the olive-gray clay, a light brown silty clay with pebbles and limestone fragments, was encountered at the bottom of the borings.

5.0 CONCLUSIONS AND RECOMMENDATIONS

A review of the Material Safety and Data Sheets for the solvents historically poured on the coal pile indicates the presence of the following compounds: Petroleum Naphtha, 2-Butoxy Ethanol, Cyclohexanol and Isobutyl Alcohol. Laboratory testing for the presences of volatile organic compounds and semivolatile organic compounds did not reveal the presence of any of the target compounds. Based on these results, we do not believe the pouring of solvents on the boiler coal supply has impacted underlying soils. Acetone was present in low concentrations in all the borings, however, based on the low concentrations detected, the acetone is considered to be a laboratory contaminant. The result of our subsurface assessment indicate that no further assessment is warranted at this time.

APPENDIX C
DRILLING PROCEDURES

SOIL SAMPLING

Soil Boring Construction

A total of five soil borings were advanced using a hand auger at the subject site as shown in Figure 2. The borings will be located as follows:

Four 5-foot deep hand auger borings were located beneath the area where spent solvents were poured on the coal pile.

One hand auger boring were advanced to a depth of 5-feet near the east side of the coal storage and mixing area. This sample will be obtained from an area beneath the coal pile where no solvents were poured. This sample will be used as the comparison sample for the samples obtained from areas beneath the coal pile where solvents were poured.

On completion, the borings were backfilled with sand.

Soil

Undisturbed soil samples were taken at depths of one feet and five feet below the ground surface. The soil samples obtained at a depth of one foot were used to assess the impact of the pouring of spent solvents on the coal pile. The soil samples obtained from a depth of five feet were used to assess the potential migration of contaminants, if any. The soil samples obtained from beneath the coal pile where spent solvents were poured will be compared to the areas where solvents were not poured on the coal pile. The samples were acquired with a hand sampler driven ahead of the hand auger. The samples were retained in clean brass sleeves that will be capped with Teflon-lined plastic caps, labeled, and placed into a chilled ice chest. Duplicate soil samples will be screened for the presence of volatile organic vapors using a flame ionozation detector (FID)

The samples were collected and logged by one of our field engineer/scientists. The samples were be stored in an insulated ice chest until transportation to a state-certified laboratory for analysis. The appropriate Chain-of-Custody documentation accompanied the samples at all times.

Decontamination Procedures

The sampling equipment and brass sleeves were be washed prior to use using the standard EPA three bucket wash/rinse.

LABORATORY ANALYSIS

Ten soil samples were selected based on field observations and PID readings were chemically analyzed for Volatile Organic Compounds (VOCs) by EPA Method 8240 and for semi-volatile organic compounds by EPA Method 8270.

APPENDIX D
HEALTH AND SAFETY PLAN

HEALTH AND SAFETY PLAN
FOR
PHASE II ENVIRONMENTAL SITE ASSESSMENT
AT
CAMPBELL SOUP COMPANY/
NAPOLEON PLANT
NAPOLEON, OHIO

Prepared for:

Campbell Soup Company

Napoleon, Ohio

Prepared by:

Law Engineering, Inc.

Cincinnati, Ohio

August 31, 1994

Law Engineering Project No. 724.94.138

PROJECT PRINCIPAL	Daniel T. Elliott	8/31/94 Date
PROJECT MANAGER/ SITE HEALTH & SAFETY COORDINATOR	James M. DeLano	8/31/94 Date

1.0 INTRODUCTION

The Health and Safety Plan provides site-specific health and safety controls to be followed during the site assessment field activities to be performed at the Campbell Soup Company/Napoleon Plant. The elements of this plan include procedures for personnel protection, personnel and equipment safety, medical surveillance, air quality monitoring, and general work practices for Law Engineering, Inc. and our subcontractors. This plan also details the proper emergency procedures including emergency response and first-aid capabilities. Compliance with this Health and Safety Plan is required of workers and third parties who enter the field operation areas during the field activities.

The purpose of this Health and Safety Plan is to describe the anticipated physical and health hazards, controls, and procedures needed to minimize the accident and injury risks associated with field work conducted during the field activities at the subject facility.

The provisions specified here are intended to conform to applicable State environmental and occupational health and safety regulations. These control measures will apply to field personnel who participate in the field work. Field personnel will continuously monitor the site conditions to ensure that the field work does not endanger surrounding on-site and off-site personnel.

ooOoo

2.0 ASSIGNMENT OF RESPONSIBILITIES

2.1 INTRODUCTION

The following sections briefly describe the health and safety personnel responsibilities which will be employed during the site assessment activities at the site.

2.2 SITE HEALTH AND SAFETY COORDINATOR

The Site Health and Safety Coordinator (SHSC) is responsible for the development of the site plan. These areas of responsibility include hazard assessment, medical requirements, training requirements, air monitoring, personal protective equipment, site control, decontamination protocol, emergency actions and record keeping.

2.3 FIELD SUPERVISOR/SITE SAFETY OFFICER

The field supervisor is responsible for field implementation of the plan and is the Site Safety Officer (SSO). This includes communicating specific requirements to site personnel and consulting with the health and safety coordinator on safety and health requirements. The field supervisor, in conjunction with the Site Health and Safety Coordinator will implement emergency actions, as necessary. The field supervisor has final authority at the site.

2.4 SITE PERSONNEL

Site personnel are responsible for understanding and complying with site safety and health requirements. Safety Meeting Documentation forms (Figure 2-A) will be used to document that site personnel have been apprised of site safety and health requirements.

ooOoo

2.0 ASSIGNMENT OF RESPONSIBILITIES

2.1 INTRODUCTION

The following sections briefly describe the health and safety personnel responsibilities which will be employed during the site assessment activities at the site.

2.2 SITE HEALTH AND SAFETY COORDINATOR

The Site Health and Safety Coordinator (SHSC) is responsible for the development of the site plan. These areas of responsibility include hazard assessment, medical requirements, training requirements, air monitoring, personal protective equipment, site control, decontamination protocol, emergency actions and record keeping.

2.3 FIELD SUPERVISOR/SITE SAFETY OFFICER

The field supervisor is responsible for field implementation of the plan and is the Site Safety Officer (SSO). This includes communicating specific requirements to site personnel and consulting with the health and safety coordinator on safety and health requirements. The field supervisor, in conjunction with the Site Health and Safety Coordinator will implement emergency actions, as necessary. The field supervisor has final authority at the site.

2.4 SITE PERSONNEL

Site personnel are responsible for understanding and complying with site safety and health requirements. Safety Meeting Documentation forms (Plate 2-A) will be used to document that site personnel have been apprised of site safety and health requirements.

ooOoo

3.0 GENERAL HEALTH AND SAFETY REQUIREMENTS

3.1 TRAINING

Health and Safety training is required for personnel assigned to work on the site or who may be expected to perform potentially hazardous activities.

Consistent with the Federal OSHA 29 CFR 1910.120 regulations covering Hazardous Waste Operations and Emergency Response, site personnel are required to be trained in accordance with the standard. At a minimum, personnel are required to be trained to recognize the hazards on site, the provisions of this HSP and the responsible personnel.

3.1.1 Preassignment Training

Prior to arrival on site, each employer shall be responsible for certifying that field personnel meet the requirements of preassignment training. Consistent with Federal OSHA 29 CFR 1910.120 each employer shall be able to provide a document certifying dates of 40 hours of training. An employer may also grandfather experienced personnel. Personnel must receive 8 hours of annual refresher training.

3.1.2 Site-Specific Training

Site personnel will complete site-specific training that will address potential hazards anticipated to be at the site and control measures to be implemented. This training will include the following:

- Health and Safety Plan - Site personnel will be instructed verbally on the contents of the plan.

- Hazard Awareness - Employees will be made aware of the chemicals used or suspected to have been used on site. Information will include potential routes of exposure, acute and/or chronic effects, protective clothing to be worn, precautionary measures to be taken, and specific task assignments.

- Safety meeting information will be recorded on Safety Meeting Documentation forms (Plate 2-A), which will be retained in project files.

3.1.3 First Aid and CPR Training

It is required that a selected number of field personnel including the SHSC shall have First-Aid and CPR training. These courses shall be consistent with the requirements of the American Red Cross Association. Only employees current in first-aid/CPR training are to render assistance to an injured employee.

3.2 MEDICAL PROGRAM

Medical monitoring programs are designed to track the physical condition of employees on a regular basis as well as to establish preemployment or baseline conditions prior to potential exposures. The medical surveillance program is part of each employer's Health and Safety Program.

3.2.1 Baseline or Preassignment and Periodic Monitoring

Prior to being assigned to a hazardous or potentially hazardous activity involving exposure to toxic materials, each site employee must have received a preassignment or baseline physical or an update physical within the last 12 months that complies with the Federal OSHA 29 CFR 1910.120 requirements. The specific contents of the physical is to be determined by the employer's medical consultant.

No additional testing for site specific contaminant health effects is required for this site.

3.2.2 Exposure/Injury/Medical Support

As a follow-up to an injury or possible exposure above established exposure limits, all employees are entitled to and encouraged to seek medical attention and physical testing. Depending upon the type of exposure, it is critical to perform follow-up testing within 24-48 hours. In the event of an injury, site personnel are to administer first-aid, as appropriate, transport the victim to the closest emergency care facility as identified on

Plate 1-A, or call 911 for assistance.

3.3 SITE SAFETY MEETINGS

Site Safety meetings will be conducted by the SSO before field personnel begin work, when there are modifications to the Health and Safety Plan, and when additional personnel begin field work. Meetings shall be attended by all field personnel involved in field activities.

The meeting topics shall include the following:

- Description of the assigned tasks and their potential hazards;
- Coordination of site activities;
- Physical and health hazards;
- Identification of methods and precautions to prevent injuries;
- Emergency planning;
- Modification to Health and Safety Plan;
- Input from field personnel on health and safety issues pertaining to site activities; and
- Collection of the attendees' signatures, acknowledging receipt and understanding of the Health and Safety Plan and their agreement to comply.

oo0oo

4.0 PHYSICAL AND CHEMICAL HAZARDS

The following section details the potential safety and hazards which may be encountered during the drilling project.

4.1 PHYSICAL HAZARDS

Anticipated physical hazards include exposure to noise from site equipment, heavy equipment and traffic hazards, vehicle use, heat stress from the use of personal protective equipment, and other hazards associated with any outdoor labors such as slips, trips, falls, splashes, spills, and material-handling (back) injuries. Caution will be exercised to avoid such hazards.

4.1.1 Heat Stress

The ambient air temperature is expected to be above 70°F; therefore, heat stress monitoring will be required.

Heat Stress Illnesses

- Heat stroke is a life threatening situation in which the victim's temperature control system, which produces sweating to cool body, stops working. Body temperature can rise quickly to levels that can cause brain damage and death. Immediate action is required.

- Heat exhaustion is less dangerous and results from loss of body fluids. This fluid loss causes blood flow to decrease in vital organs, resulting in a form of shock. In addition, sweat does not evaporate properly due to high humidity or layers of clothing, resulting in inadequate cooling of the body.

- Heat cramps are muscular spasms due to heavy exertion. These cramps usually involve the abdomen and legs and are caused by the loss of water and salt via heavy sweating.

- Heat rash is a skin rash that occurs from excessive moisture and chaffing clothes. Commonly referred to as "prickly rash".

Preventing heat stress is particularly important because once someone suffers from heat stroke or heat exhaustion, that person may be predisposed to additional heat injuries. The signs/symptoms and first-aid for heat related illnesses are summarized in Table 1.

Method of Controlling Heat Stress

Adequate shade in which employees can rest and drinking water (or electrolyte solution to prevent dehydration) must be available at the site. Employees are encouraged to drink plenty of fluids.

The following initial work schedule will be implemented:

Heat Stress Monitoring:

- Count the heart rate by the radial pulse for 1 minute for all personnel at the beginning of the day prior to start of activities.
- Work for 1 to 1½ hours.
- Break for 15 minutes.
- Count the radial pulse for all personnel for 30 seconds (and multiply by 2) at the beginning of the break period.
- If the heart rate exceeds 110 beats per minute (BPM), shorten the next work cycle by ⅓ and keep the rest periods at 15 minutes.
- If the heart rate exceeds 110 BPM at the next rest period, shorten the next work cycle by ⅓ again, keeping the 15 minute breaks.

- If the heart rate ever exceeds 120 BPM, the employee will be required to rest for 30 to 45 minutes to allow the heart rate to decrease to at least 90 BPM.

Forms of Heat Stress	Signs/Symptoms	First Aid
Heat Stroke	Hot, red skin Constricted (small) pupils High body temperature Unusually dry skin	Call EMS (911), care for shock. Immerse in cool water or wrap in wet towels. Give NOTHING by mouth.
Heat Exhaustion	Cool, pale, moist skin Heavy sweating Normal body temperature Dilated (large) pupils Headache, nausea, dizziness, vomiting	Move to cool area. Have victim lie down, elevating feet by 1 to 1½ feet. Loosen clothing. Apply wet towels, give glass of water every 15 minutes.
Heat Cramps	Muscular pain, aches that typically occur several hours after cessation of work/heat exposure	If cramps occur on-site move to cool place. Give glass of water every 15 minutes. Replace lost fluids/electrolytes as necessary if cramps occur off the site.

4.2 CHEMICAL HAZARDS

The principal hazard to site investigation personnel at the Campbell Soup Company/Napoleon Plant facility is potential exposure to petroleum naptha, cyclohexcanol, and isobutyl and amino alcohol. Potential hazards include toxicity due to inhalation and dermal contact of the various compounds present.

Chemical hazard information is summarized on the table presented on the following page.

CHEMICAL HEALTH HAZARD INFORMATION

Chemical / Compound	ACGIH TLVs		NIOSH	Routes of Entry	Target Organs	Acute Exposure Symptoms
	TWA	STEL	IDLH			
Mineral Spirits 135/ Petroleum Naptha	100 ppm	200 ppm	10,000 ppm	Inhalation, Ingestion, skin contact, skin absorbtion	CNS, eyes, skin, respiratory system	Diziness, drownsiness, nausea; irratation of eyes, nose, throat
2 – Butoxy Ethanol	25 ppm	NA	700 ppm	Inhalation, ingestion, skin contact, skin contact, skin absorption	Eyes, skin respiratory stem	Eye, nose, skin, hemolysis
Cyclohexanol	50 ppm	50 ppm	3500 ppm	Inhalation, ingestion, skin contact, skin absorption	Eyes, skin, respiratory system	Irritated eyes, nose, skin; skin narcosis
Isobutyl Alcohol	50 ppm	50 ppm	8000 ppm	Inhalation, ingestion	Eyes, skin; respiratory system	Irritates eyes, skin; drowsiness stupor, dermatitis

4.2.1 Hazard Evaluation

Route of Exposure

Chemical contaminants may be a health hazard to site personnel via ingestion, skin absorption, or inhalation. Accidental ingestion of contaminants may occur as a result of dust or soil on the hands and hand to mouth contact or inhalation. Inhalation of vapor may occur during soil disruption activities, sample collection, and sample preparation. Skin absorption is possible if skin directly contacts site contaminants, contaminated soil or water.

4.3 LEVEL OF PROTECTION

For the described activities, personnel working at the site will initially be required to wear Level D protection. This protection will include the following:

- Coveralls
- Steel-toed boots
- Hard hat
- Disposable gloves during sample handling operations
- Eye protection, as necessary
- Ear protection, as necessary

Higher or lower levels of protective equipment may be required depending on hazard assessments and air monitoring readings during field work. The upgrade or downgrade of protective equipment will be recorded on the Field Activity Daily Log form.

If the PID steady state meter reading in the worker's breathing zone is 20 ppm or more, for one minute, then the SSO will authorize Level C protection.

Level C includes:

- Full face respirator NIOSH approved with organic vapor cartridges

- Tyvek suits (if splash hazard is possible, a polyethylene coated suit must be worn)
- Nitrile, butyl rubber, or neoprene gloves
- Steel toe/shank chemically resistant rubber or neoprene work boot, or steel toe/shank work boot with chemically resistant outer boots
- Inner disposable gloves (two pairs recommended)
- Hard hat
- Hearing protection (as appropriate)

If the PID steady state meter reading is over 250 ppm for one minute, then work will stop until Level B protection can be used.

Level B includes:

- Air supplied respirator
- Coated Tyvek suit, such as Saranex
- Nitrile, butyl rubber, or neoprene gloves
- Inner latex or vinyl gloves
- Steel toe and shank boots
- Outer boots - chemically resistant, rubber or neoprene
- Hard hat
- Hearing protection (as appropriate)

ooOoo

5.0 SITE SAFETY WORK PLAN

5.1 SITE ENTRY PROCEDURES

It will be necessary for the field team to control access to the work area. The SSO will mark a restricted area, using traffic delineators (cones) and highly visible tape. Only persons who meet the safety training and medical monitoring requirements and who are in possession of the required personal protective equipment will be allowed in the restricted area. Prior to the start of field work activities, the SSO will perform the following steps as necessary:

- Sign in with facility representative and inform him of each day's planned activities.
- Locate the nearest telephone and post the emergency telephone numbers.
- Identify the locations of the fire extinguisher, emergency eye wash, first aid kit, restrooms, and rest areas.
- Flagging and barricades will be placed to prohibit entry of all unauthorized personnel to the work area/Exclusion Zone.
- Setup support zone, decontamination zone, and the up-site access point.
- Evaluate site conditions.

5.2 AIR MONITORING REQUIREMENTS

Monitoring for volatile organic compounds (VOCs) will be conducted using an photoionization detector (PID) which will be calibrated prior to use in accordance to the manufacturer's instructions. Calibration shall be recorded in the calibration log. Monitoring for combustible atmospheres will be conducted during drilling activities using either a combustible gas indicator (CGI) or the PID. VOCs will be monitored in the breathing zone of the workers. Combustible atmospheres will be monitored in low lying areas, excavations, sumps or pits, near the boring locations, and in other areas as dictated by site conditions.

- The buddy system will be used at all times.
- Work will be done during the daylight hours only.
- Site activities will not be conducted during lightning storms.

5.4 DECONTAMINATION PROCEDURES

The site safety coordinator is responsible for ensuring that all pieces of equipment are properly decontaminated according to the procedures outlined above. Decontamination must be documented in the Field Daily Activity Logs.

5.4.1 Decontamination Area

Set decontamination area upwind and upgradient of the work area, as necessary. The decontamination area must be established at a sufficient distance from the drilling locations to preclude contamination by splashing water or flying dirt.

5.4.2 Personnel

Wash outer gloves and boots with soap and water. Remove and dispose of Tyvek suit or cotton coveralls, as applicable. Remove boots and then outer gloves. Remove respirator and finally remove inner gloves. Wash hands and face with soap and water, and dispose of Tyvek in drums. Containerize rinsate on-site for proper disposal. Take a shower and wash hair as soon as possible after leaving the site.

5.4.3 Equipment Decontamination

Drilling rig, drilling and sampling tools and air monitoring instruments will be cleaned before transport to the non-contaminated work area. The equipment decontamination procedures are described in the work plan.

5.4.4 Disposal of Materials Used On Site

Solid and liquid wastes generated during decontamination procedures and disposable personal protective equipment will be packed in 55-gallon reconditioned drums, and shall be contained in a secure area and will be inventoried and labeled. After analytical results determine whether soil or water is contaminated, the drums will be disposed of in an appropriate manner.

ooOoo

Responsible Personnel:

Team Members	Responsibility	Phone No.
James DeLano	Field Supervisor/Site Safety Officer	(606) 371-2960
Dan Elliott	Project Manager/ Site Health & Safety Coordinator	(213) 889-5300
Nancy Newlander	Health and Safety Consultant	(213) 889-5300

6.2 PERSONNEL INJURY

The following steps will be taken if an injury occurs:

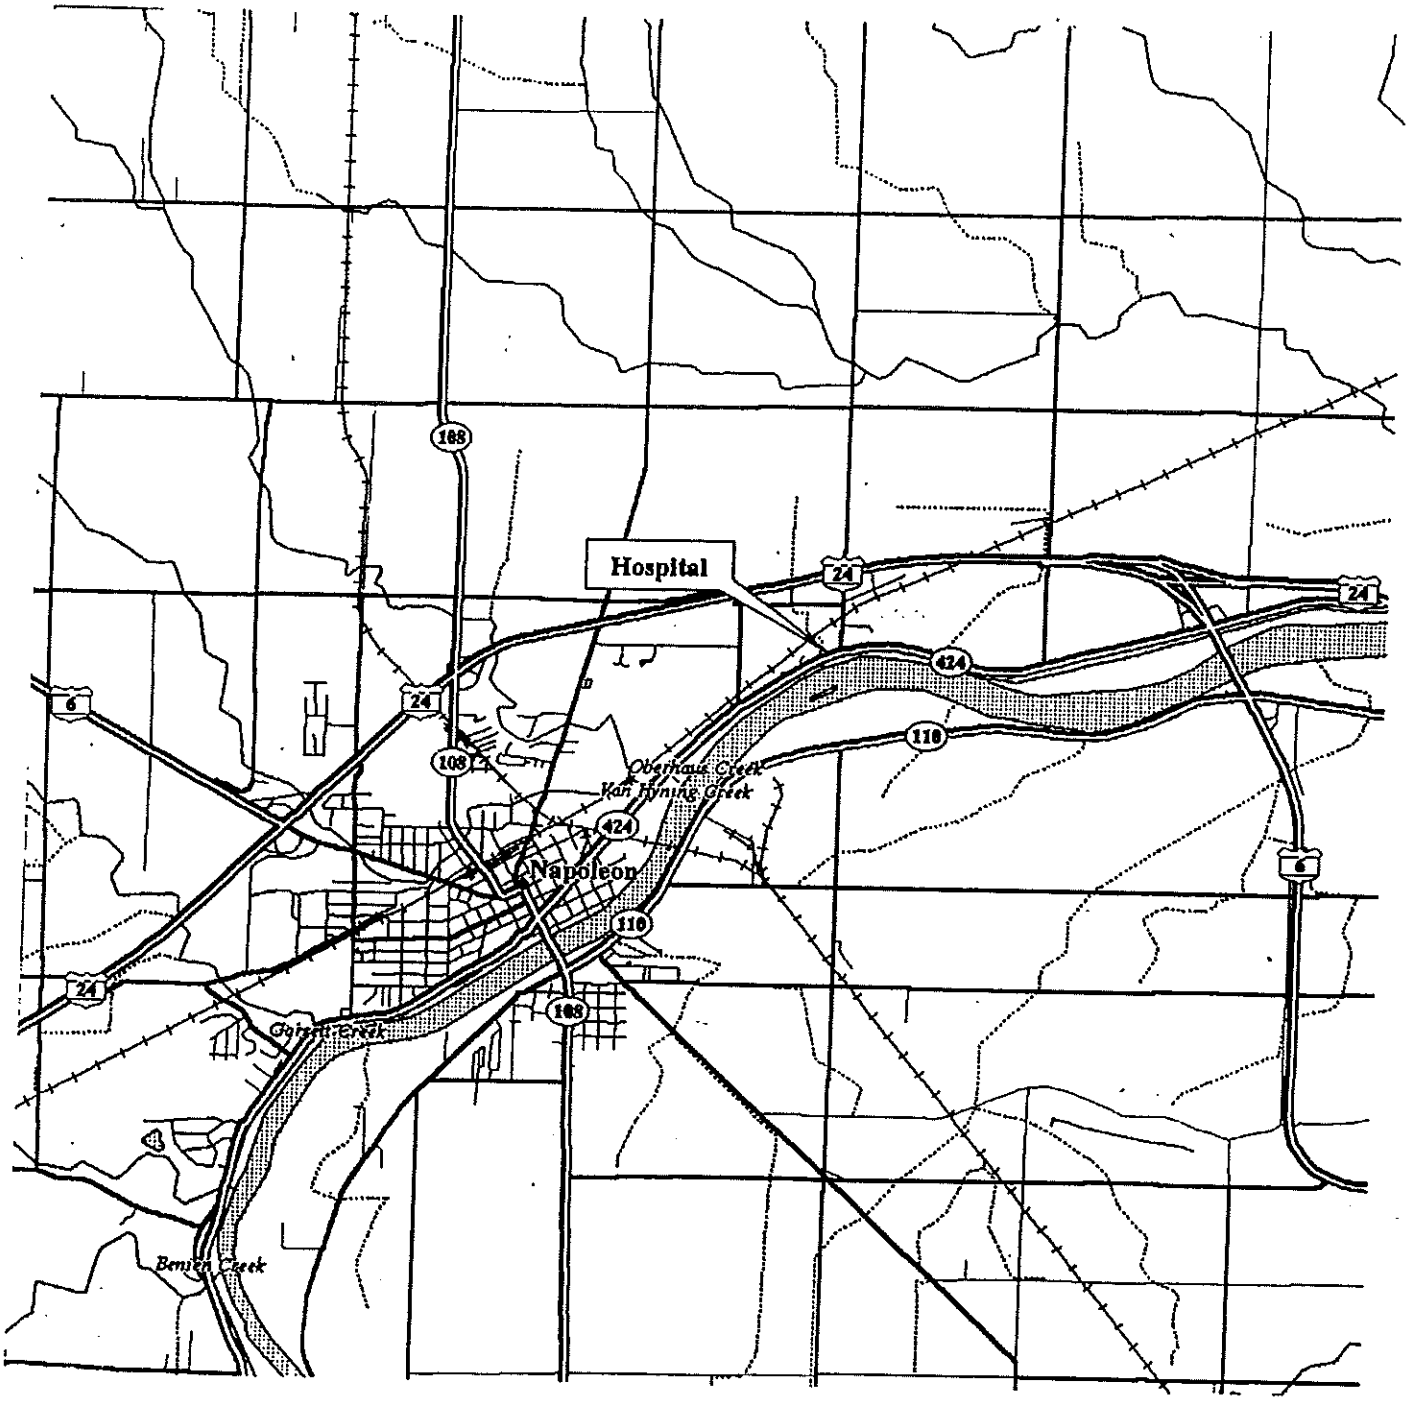
- Prevent further injury and notify the SSO.
- Initiate first aid and provide immediate medical attention for the injured person.
- Depending on the type and severity of the injury, call 911 or transport victim to nearest emergency medical facility.
- Notify the injured person's supervisor or personnel office.
- Prepare an injury incident report. The Project Manager is responsible for preparing and submitting the incident report to the Health and Safety Officer, the Manager, and the Corporate Personnel Office within 48 hours.

6.2.1 Small Fire/Explosion

In the event of a small, controlled, explosion or fire, the field supervisor will determine if fire suppression can be achieved by site personnel. Only trained, qualified personnel will be used. Appropriate actions include:

- Notify site personnel to leave work zone.
- Use of heavy equipment to smother flames with clean site soil or clean fill, if readily available.

- Use of fire extinguishers.
- Use of clean decontamination water.
- Evacuate work zone or fire area, call facility emergency number, as required.
- Evacuate work zone or fire area, call 911.
- Stay at the site while waiting for Fire Department as long as it is safe to do so.
- Notify Project Manager, Health and Safety Officer, or Department Manager.
- Determine with appropriate facility, Fire Department personnel ability to continue work.
- Notify site personnel of decision to continue work or to stop work.



6.2.2 Large Fire/Explosion

In the event of an uncontrolled or large fire or explosion, the field supervisor will:

- Immediately sound evacuation alarm.
- Call 911, or facility emergency number.
- Take head count.
- Move personnel off site to wait for Fire Department.
- Notify Project Manager, Branch Manager, or Health and Safety Officer.
- Determine, in conjunction with facility personnel and Project Manager, whether to send home site personnel.
- Remain at location, if necessary for fire department or facility investigation.

6.3 EMERGENCY SIGNALS

EQUIPMENT	SIGNAL	REQUIRED ACTION
Air Horn	1 long blast 10 seconds apart	Stop work, turn off equipment, leave work zone, use modified decon procedures, assemble in support zone
Air Horn	3 short successive blasts 10 seconds between each set	Immediately stop work, turn off equipment and evacuate site; assemble in alternate area as indicated in tailgate meetings

Section III—PHYSICAL DATA

BOILING RANGE (°F): 320-340 VAPOR DENSITY: [vv] HEAVIER [ ] LIGHTER THAN AIR

EVAPORATION RATE: [ ] FASTER [vv] SLOWER THAN ETHER PERCENT VOLATILE BY VOLUME: 44 WEIGHT PER GALLON: 8.25

Section IV—FIRE AND EXPLOSION HAZARD DATA

FLAMMABILITY CLASSIFICATION: COMBUSTIBLE OSHA Class II FLASH POINT (SETAFLASH): 122 °F LEL 1.1

EXTINGUISHING MEDIA: Carbon dioxide, dry chemical, foam.

UNUSUAL FIRE AND EXPLOSION HAZARDS: Keep containers tightly closed. Avoid sources of ignition. Ground all transfer equipment. Closed containers may explode when exposed to extreme heat.

SPECIAL FIRE FIGHTING PROCEDURES: Water spray (fog nozzles) may be used for cooling closed containers. Full protective equipment should be used by firefighters to protect them from hazardous decomposition products listed in Section VI.

MSDS - 3

Section V—HEALTH HAZARD DATA

THRESHOLD LIMIT VALUE: SEE SECTION II

EFFECTS OF OVEREXPOSURE: ACUTE

EYES - Can cause severe irritation, tearing, blurred vision.

SKIN - Prolonged or repeated contact can cause moderate irritation, drying, defatting, dermatitis. Toxic if absorbed through the skin.

INHALATION - Excessive inhalation of vapors can cause nasal and respiratory irritation, dizziness, weakness, fatigue, nausea, headache, possible unconsciousness and asphyxiation.

INGESTION - Can cause gastrointestinal irritation, nausea, vomiting and diarrhea.

EFFECTS OF OVEREXPOSURE: CHRONIC

Prolonged and repeated overexposure may cause anemia, liver abnormalities, kidney damage, lung damage, blood abnormalities.

AGGRAVATED MEDICAL CONDITIONS:

Pre-existing skin, eye, lung, kidney, blood and liver disorders may be aggravated by exposure.

PRIMARY ROUTES OF ENTRY:

Inhalation, skin contact and absorption.

EMERGENCY AND FIRST AID PROCEDURES: In case of skin contact, wash thoroughly with soap and water: for eyes, flush immediately with plenty of water for 15 minutes and call a physician. Remove and wash contaminated clothing before reuse. If exposed to high concentration of vapor remove patient to fresh air. If swallowed, CALL A PHYSICIAN IMMEDIATELY. DO NOT INDUCE VOMITING.

Section VI—REACTIVITY DATA

STABILITY: [ ] UNSTABLE [X] STABLE

INCOMPATIBILITY (Materials to avoid): Strong oxidizing agents.

HAZARDOUS DECOMPOSITION PRODUCTS: As with any organic chemical, thermal decomposition will yield carbon dioxide and probably carbon monoxide.

HAZARDOUS POLYMERIZATION [ ] MAY OCCUR [X] WILL NOT OCCUR

CONDITIONS TO AVOID: Sources of ignition, high temperatures.

Section VII—SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED: Remove sources of ignition, ventilate and remove with inert absorbent.

WASTE DISPOSAL METHOD: Incinerate in approved facility in accordance with local, state and federal regulations. Do not incinerate closed container.

Section VIII—SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION: Use NOISH approved respiratory device when airborne exposure limits are exceeded. Provide ventilation to control exposure levels below airborne exposure limits.

VENTILATION: All application areas should be ventilated in accordance with OSHA regulations.

PROTECTIVE GLOVES: Recommended.

EYE PROTECTION: Use approved safety eyewear with splash guards.

OTHER PROTECTIVE EQUIPMENT: Safety shower and eye bath.

Section IX—SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORING: Keep away from heat, sparks and open flame Use only with adequate ventilation. Since emptied containers retain product residue (vapor or liquid), all labeled hazard precautions must be observed.

OTHER PRECAUTIONS: Avoid prolonged or repeated breathing of vapor or spray mist. Avoid contact with eyes and skin. Do not take internally.

The information contained herein is furnished without warranty of any kind. Employers should use this information only as a supplement to other information gathered by them and must make independent determinations of suitability and completeness of information from all sources to assure proper use of these materials and the safety and health of employees.

SECTION III

HEALTH INFORMATION

THE HEALTH EFFECTS NOTED BELOW ARE CONSISTENT WITH REQUIREMENTS UNDER THE OSHA HAZARD COMMUNICATION STANDARD (29 CFR 1910.1200).

EYE CONTACT
LIQUID IS MINIMALLY IRRITATING TO THE EYES. HIGH VAPOR CONCENTRATIONS MAY CAUSE IRRITATION.

SKIN CONTACT
LIQUID IS SLIGHTLY IRRITATING TO THE SKIN. PROLONGED OR REPEATED LIQUID CONTACT CAN RESULT IN DEFATTING AND DRYING OF THE SKIN WHICH MAY RESULT IN SKIN IRRITATION AND DERMATITIS.

PRODUCT NAME; MINERAL SPIRITS 135

ALATION
PORS MAY BE IRRITATING TO NOSE, THROAT AND RESPIRATORY TRACT. HIGH VAPOR CONCENTRATIONS MAY
AUSE CNS DEPRESSION.

ESTION
STION OF PRODUCT MAY RESULT IN VOMITING; ASPIRATION (BREATHING) OF VOMITUS INTO THE LUNGS MUST
AVOIDED AS EVEN SMALL QUANTITIES MAY RESULT IN ASPIRATION PNEUMONITIS.

IS AND SYMPTOMS
TATION AS NOTED ABOVE. EARLY TO MODERATE CNS (CENTRAL NERVOUS SYSTEM) DEPRESSION MAY BE
IDENCED BY GIDDINESS, HEADACHE, DIZZINESS AND NAUSEA; IN EXTREME CASES, UNCONCIOUSNESS AND DEATH
AY OCCUR. ASPIRATION PNEUMONITIS MAY BE EVIDENCED BY COUGHING, LABORED BREATHING AND CYANOSIS
BLUISH SKIN); IN SEVERE CASES DEATH MAY OCCUR.

AVATED MEDICAL CONDITIONS
EXISTING EYE, SKIN AND RESPIRATORY DISORDERS MAY BE AGGRAVATED BY EXPOSURE TO THIS PRODUCT.

ECTION VI FOR SUPPLEMENTAL INFORMATION.

ON IV OCCUPATIONAL EXPOSURE LIMITS

OSHA. PEL/TWA	PEL/CEILING	ACGIH TLV/TWA	TLV/STEL	OTHER
500 PPM		100 PPM	200 PPM	

COMMEND THAT LIMITS FOR STODDARD SOLVENT BE USED AS A GUIDE.

ON V EMERGENCY AND FIRST AID PROCEDURES

E NTACT
S EYES WITH PLENTY OF WATER FOR 15 MINUTES WHILE HOLDING EYELIDS OPEN. GET MEDICAL ATTENTION.

N CONTACT
NOVE CONTAMINATED CLOTHING/SHOES. FLUSH SKIN WITH WATER. FOLLOW BY WASHING WITH SOAP AND WATER.
RRITATION OCCURS, GET MEDICAL ATTENTION. DO NOT REUSE CLOTHING UNTIL CLEANED.

ALATION
OVE VICTIM TO FRESH AIR AND PROVIDE OXYGEN IF BREATHING IS DIFFICULT. GIVE ARTIFICIAL
PIRATION IF NOT BREATHING. GET MEDICAL ATTENTION.

ES ON
NOT INDUCE VOMITING. IF VOMITING OCCURS SPONTANEOUSLY, KEEP HEAD BELOW HIPS TO PREVENT
IRATION OF LIQUID INTO THE LUNGS. GET MEDICAL ATTENTION.*

1 PHYSICIAN
MORE THAN 2.0 ML PER KG HAS BEEN INGESTED AND VOMITING HAS NOT OCCURRED, EMESIS SHOULD BE
UCED WITH SUPERVISION. KEEP VICTIM'S HEAD BELOW HIPS TO PREVENT ASPIRATION. IF SYMPTOMS SUCH
LOS OF GAG REFLEX, CONVULSIONS OR UNCONSCIOUSNESS OCCUR BEFORE EMESIS, GASTRIC LAVAGE USING A
ED ENDOTRACHEAL TUBE SHOULD BE CONSIDERED.

IO VI SUPPLEMENTAL HEALTH INFORMATION

RATS EXPOSED FOR 90 DAYS BY INHALATION TO VAPORS OF SOLVENTS SIMILAR TO COMPONENT 1 SHOWED
EN OF KIDNEY DAMAGE. THE RELEVANCE OF THIS EFFECT TO MAN IS UNKNOWN. IN ONE OF THE STUDIES
ADE ANEMIA WAS ALSO OBSERVED.

EXPOSED FOR 4 MONTHS TO 1700 PPM OF A SOLVENT SIMILAR TO COMPONENT 2 SHOWED EVIDENCE OF MILD
SE TO THE LIVER, LUNGS AND KIDNEYS. THESE EFFECTS WERE NOT SEEN IN RATS EXPOSED FOR ONE YEAR
O PM OF ANOTHER SIMILAR SOLVENT. RATS EXPOSED TO VAPORS OF A SIMILAR SOLVENT DURING
AN SHOWED EMBRYO/FETOTOXICITY AT CONCENTRATIONS PRODUCING MATERNAL TOXICITY.

BOILING POINT: 330-390 (DEG F)

SPECIFIC GRAVITY: 0.78 (H2O=1)

VAPOR PRESSURE: 16*@100 DEG (MM HG)

MELTING POINT: NOT AVAILABLE (DEG F)

SOLUBILITY: (IN WATER) NEGLIGIBLE

VAPOR DENSITY: 4.8* (AIR=1)

EVAPORATION RATE (N-BUTYL ACETATE = 1): <0.1*

*ESTIMATED

APPEARANCE AND ODOR:
LIGHT COLORED LIQUID. HYDROCARBON ODOR.

SECTION VIII FIRE AND EXPLOSION HAZARDS

FLASH POINT AND METHOD:
114 DEG. F (TCC)

FLAMMABLE LIMITS /% VOLUME IN AIR
LOWER: 1 UPPER: 6

EXTINGUISHING MEDIA
USE WATER FOG, FOAM, DRY CHEMICAL OR CO2. DO NOT USE A DIRECT STREAM OF WATER. PRODUCT WILL FLOAT AND CAN BE REIGNITED ON SUFACE OF WATER.

SPECIAL FIRE FIGHTING PROCEDURES AND PRECAUTIONS
CAUTION. COMBUSTIBLE. DO NOT ENTER CONFINED FIRE SPACE WITHOUT FULL BUNKER GEAR (HELMET WITH FACE SHIELD, BUNKER COATS, GLOVES AND RUBBER BOOTS). INCLUDING A POSITIVE PRESSURE NIOSH APPROVED SELF-CONTAINED BREATHING APPARATUS. COOL FIRE EXPOSED CONTAINERS WITH WATER.

UNUSUAL FIRE AND EXPLOSION HAZARDS
CONTAINERS EXPOSED TO INTENSE HEAT FROM FIRES SHOULD BE COOLED WITH WATER TO PREVENT VAPOR PRESSURE BUILDUP WHICH COULD RESULT IN CONTAINER RUPTURE. CONTAINER AREAS EXPOSED TO DIRECT FLAME CONTACT SHOULD BE COOLED WITH LARGE QUANTITIES OF WATER AS NEEDED TO PREVENT WEAKENING OF CONTAINER STRUCTURE.

SECTION IX REACTIVITY

STABILITY: STABLE

HAZARDOUS POLYMERIZATION: WILL NOT OCCUR

CONDITIONS AND MATERIALS TO AVOID:
AVOID HEAT, FLAME AND CONTACT WITH STRONG OXIDIZING AGENTS.

HAZARDOUS DECOMPOSITION PRODUCTS
CARBON MONOXIDE AND UNIDENTIFIED ORGANIC COMPOUNDS MAY BE FORMED DURING COMBUSTION.

SECTION X EMPLOYEE PROTECTION

RESPIRATORY PROTECTION
AVOID PROLONGED OR REPEATED BREATHING OF VAPORS. IF EXPOSURE MAY OR DOES EXCEED OCCUPATIONAL EXPOSURE LIMITS (SEC. IV) USE A NIOSH-APPROVED RESPIRATOR TO PREVENT OVEREXPOSURE. IN ACCORD WITH 29 CFR 1910.134 USE EITHER AN ATMOSPHERE-SUPPLYING RESPIRATOR OR AN AIR-PURIFYING RESPIRATOR FOR ORGANIC VAPORS.

PROTECTIVE CLOTHING
AVOID CONTACT WITH EYES. WEAR SAFETY GLASSES OR GOGGLES AS APPROPRIATE. AVOID PROLONGED OR REPEATED CONTACT WITH SKIN. WEAR CHEMICAL-RESISTANT GLOVES AND OTHER CLOTHING MINIMIZE CONTACT

RODUCT NAME: MINERAL SPIRITS 135

DITIONAL PROTECTIVE MEASURES
USE EXPLOSION-PROOF VENTILATION AS REQUIRED TO CONTROL VAPOR CONCENTRATIONS. AIR-DRY CONTAMINATED CLOTHING IN A WELL VENTILATED AREA, THEN LAUNDER BEFORE REUSING.

SECTION XI ENVIRONMENTAL PROTECTION

LL OR LEAK PROCEDURES
CAUTION. COMBUSTIBLE. *** LARGE SPILLS *** ELIMINATE POTENTIAL SOURCES OF IGNITION. WEAR APPROPRIATE RESPIRATOR AND OTHER PROTECTIVE CLOTHING. SHUT OFF SOURCE OF LEAK ONLY IF SAFE TO DO DIKE AND CONTAIN. REMOVE WITH VACUUM TRUCKS OR PUMP TO STORAGE/SALVAGE VESSELS. SOAK UP IDUE WITH AN ABSORBENT SUCH AS CLAY, SAND, OR OTHER SUITABLE MATERIAL; PLACE IN NON-LEAKING NTAINERS AND SEAL TIGHTLY FOR PROPER DISPOSAL. FLUSH AREA WITH WATER TO REMOVE TRACE RESIDUE; DISPOSE OF FLUSH SOLUTION AS ABOVE. *** SMALL SPILLS *** TAKE UP WITH AN ABSORBENT MATERIAL AND PL CE IN NON-LEAKING CONTAINERS FOR PROPER DISPOSAL.

SECTION XII SPECIAL PRECAUTIONS

EP LIQUID AND VAPOR AWAY—FROM HEAT, SPARKS AND FLAME. SURFACES THAT ARE SUFFICIENTLY HOT MAY IGNITE EVEN LIQUID PRODUCT IN THE ABSENCE OF SPARKS OR FLAME. EXTINGUISH PILOT LIGHTS, CIGARETTES AN TURN OFF OTHER SOURCES OF IGNITION PRIOR TO USE AND UNTIL ALL VAPORS ARE GONE. VAPORS MAY MULATE AND TRAVEL TO IGNITION SOURCES DISTANT FROM THE HANDLING SITE; FLASH-FIRE CAN RESULT. CONTAINERS CLOSED WHEN NOT IN USE. USE WITH ADEQUATE VENTILATION.

CONTAINERS, EVEN THOSE THAT HAVE BEEN EMPTIED, CAN CONTAIN EXPLOSIVE VAPORS. DO NOT CUT, DRILL, D, WELD OR PERFORM SIMILAR OPERATIONS ON OR NEAR CONTAINERS.

A IC ELECTRICITY MAY ACCUMULATE AND CREATE A FIRE HAZARD. GROUND FIXED EQUIPMENT. BOND AND GROUND TRANSFER CONTAINERS AND EQUIPMENT.

SECTION XIII TRANSPORTATION REQUIREMENTS

PARTMENT OF TRANSPORTATION CLASSIFICATION:
OMBUSTIBLE LIQUID

O . PROPER SHIPPING NAME:
TI LEUM NAPHTHA

2.0 SITE DESCRIPTION

The Campbell Soup Company Napoleon facility is located on the south side of East Maumee Avenue, Napoleon, Henry County, Ohio. The facility is located at the southeast edge of Napoleon, on the south side of the Maumee River (Figure 1). The former sludge-holding pit, located in the area identified in Figure 2, was the subject of this investigation.

Sludge materials from container manufacturing processes were transported to an on-site holding area (former holding pit) and mixed with sand prior to transport to an off-site disposal facility. The holding pit was 20-feet wide by 30-feet long by 2.5-feet deep, and was excavated in an area consisting of sand and clay fill. The holding pit reportedly was lined with natural clay obtained on-site. This clay liner was compacted prior to introducing any sludge materials.

The holding pit was first put to use in 1981. It was removed from service in 1983 by excavating and disposing of the liner clay, then covering the excavated area with an additional 4- to 5-feet of new fill material. The solids and sludge materials temporarily placed in the holding pit were potentially exposed to volatile organic compounds (VOCs). Campbell Soup Company sought to determine whether VOCs were introduced to the soil beneath the former holding pit.

3.0 METHODS AND SAMPLE COLLECTION

HSG and Campbell Soup Company representatives identified the approximate location of the former holding pit. A 20-foot by 30-foot sampling grid with 10-foot grid intervals was marked over the site. The grid dimensions were based on the estimated size of the former holding pit. Twelve soil sample boring locations were staked and labeled - one at each of the grid nodes. Four additional soil sample boring locations were marked beyond the suspected edges of the grid to account for any inaccuracy in grid placement.

A Geoprobe $_{TM}$ soil-boring rig was used to collect continuous soil samples at each sample node location. Soil samples were retrieved from each boring in four-foot intervals. Soil lithology was characterized and recorded on a boring log (Appendix A) by an HSG field geologist. A photoionization detector (PID) was used to screen soil samples at one-foot intervals at each boring. PID results are indicated in Table 1, and in the soil boring logs.

Select soil samples were collected for laboratory analysis of volatile organic compounds (VOCs). Samples were placed in laboratory supplied containers, chilled with ice, and transported to the laboratory in accordance with standard laboratory protocol. All samples were submitted to Biological & Environmental Control Labs, Inc. (BEC), in Toledo, Ohio for analysis. BEC is an Ohio certified laboratory under the Voluntary Action Program. VOC analyses were conducted using standard method SW846 8260B.

Soil samples were collected from the 9.5- to 10-foot depth interval at each probe boring to determine whether VOCs have leached below the original holding pit bottom. During the investigation, PID readings indicated organic vapors near the northern and eastern portion of the grid. To determine the horizontal and vertical extent of soil contamination, six additional soil borings were advanced. Additional soil samples from various depths were submitted to the laboratory to determine what actual VOC concentrations in the affected soil. Soil sample locations are identified in Figures 2 and 3.

4.0 FINDINGS

4.1 General Observations

The former holding pit area is currently vacant and partially grass-covered. Several trees are located near the margins of the fill area surrounding the former holding pit. The fill area is elevated above the surrounding ground surface by approximately 10- to 15-feet and generally consists of fill from previous construction projects and other site activities.

Generally, the lithology under the former holding pit consists of clay till, silt and some sand. Some of the sand identified between 4- and 6-feet was yellow-brown, coarse grained and well sorted. This sand may represent residual drying sand used as mixing material in the former holding pit. Lithologic logs for each Geoprobe $_{TM}$ soil boring are included as Appendix A.

Local shallow soil contains a preponderance of clay. Previous soil borings advanced by Campbell Soup Company reportedly identified stiff clay at 4 feet below grade – and at least 10 feet thick - near the Boiler House (approximately 300 feet northeast of the holding pit). The high clay content of the local sediments is consistent with the former flood plain environments characterizing this area.

The depth to groundwater under the site was not determined. However, publications available through the Ohio State University Extension program indicate that groundwater in Henry County is obtained primarily from a carbonate aquifer located beneath 40 to 85 feet of glacial drift. The City of Napoleon uses surface water as its public water supply source.

4.2 PID Readings

PID readings indicated that organic vapors were present in soil samples collected in the north and northeastern portion of the original grid pattern (PB-3, PB-4, PB-5, PB-9, PB-14, and PB-15), extending away from the grid in the north (PB-18 and PB-21) and northwest (PB-1 and PB-19)

directions. In general the highest PID readings were recorded for samples obtained at depth intervals between 4- and 7-feet below ground surface. The maximum observed PID reading was 2,000 parts per million (ppm) recorded at the 6- to 7-foot depth interval in PB-15. PID readings dropped significantly at deeper depth intervals in each boring. The maximum bottom sample PID reading was observed in PB-18 at the 11- to 12-foot depth interval (64 ppm).

Soil samples from PB-8, PB-17, PB-20, and PB-21 contained organic vapors, but at relatively low concentrations. Samples collected from borings PB-2, PB-6, PB-7, PB-10, PB-11, PB-12, PB-13, and PB-16, did not yield detectable concentrations of organic vapors. Figure 4 presents the approximate horizontal extent of organic vapors in soil as determined by field PID readings. See Table 1 and Appendix A for field PID results.

4.3 Laboratory Results

Samples were collected from 9.5- to 10-foot depth intervals in each soil boring to verify VOC concentrations at depth. Additional soil samples were collected from shallower depths to better characterize the VOC distribution in affected soil. All samples were analyzed at the BEC laboratory in Toledo, Ohio.

4.3.1 Shallow Sample Results

Soil samples were collected from shallower depth intervals at PB-15, PB-20, PB-21, and PB-22. No VOCs were detected in the 7- to 8-foot depth interval from PB-22. Ethylbenzene was the only compound detected in PB-20 at 6 µg/kg.

The samples from PB-15 (6- to 7-foot interval) and PB-21 (8- to 9-foot interval) were collected from areas with high PID readings to determine the specific VOC compounds present in the soil, and their concentrations. Ethylbenzene, naphthalene, and xylenes were identified. The concentrations of

these compounds reported above the method detection limits in the shallower samples collected from PB-15 and PB-21 are summarized below:

Ethylbenzene	13,700 µg/kg at PB-15
	8,980 µg/kg at PB-21
Naphthalene	10,400 µg/kg at PB-15
	11,290 µg/kg at PB-21
Total xylenes	75,980 µg/kg at PB-15
	2570 µg/kg at PB-21

At both of these soil borings locations, VOC values decreased significantly in the samples collected from the deeper 9.5- to 10-foot depth interval.

4.3.2 Deep Sample Results

Laboratory results indicate that VOCs were below detection limits, or at relatively low concentrations at this depth horizon. However, VOCs were detected in the 9.5 to 10-foot soil samples obtained from borings along the northern and eastern edges of the sampling grid. A summary of all analytical results is presented in Table 2, and a copy of the laboratory report is provided in Appendix B.

VOCs were detected in soil samples obtained from the 9.5- to 10-foot depth horizon in borings PB-11, PB-12, PB-18, PB-19, PB-20 and PB-21. 2-Butanone (MEK), acetone, ethylbenzene, 4-methyl-2-pentenone (MIBK), naphthalene, and xylenes were identified. The concentrations of these compounds reported above the method detection limits at the 9.5- to 10-foot depth interval are summarized below:

MEK	62.6 µg/kg at PB-11

Acetone	63.5 µg/kg at PB-11
	70.6 µg/kg at PB-17
	70.3 µg/kg at PB-19
	54.4 µg/kg at PB-21
Ethybenzene	9.1 µg/kg at PB-15
	6.0 µg/kg at PB-20
MIBK	83.2 µg/kg at PB-19
Naphthalene	45.9 µg/kg at PB-19
Total Xylenes	38.4 µg/kg at PB-15
	25.1 µg/kg at PB-18
	8.2 µg/kg at PB-19

The Ohio EPA has not finalized a list of default cleanup or target levels applicable to industrial sites containing VOCs. Ohio action/cleanup levels are calculated using the ASTM Tier II Risk Based Corrective Action (RBCA) process with site-specific parameters. The scope of work completed for this investigation was limited, and was not intended to determine the site-specific parameters needed to calculate RBCA action/cleanup levels.

The Ohio EPA has published draft guidelines describing "single chemical cleanup numbers" for RCRA closures to generic residential standards. Action/cleanup levels for non-generic settings must be determine using the RBCA process and parameter-specific and site-specific information.

1.0 INTRODUCTION

This report presents the results and findings of an environmental investigation performed by HSI GeoTrans, Inc. (HSG), at the Campbell Soup Napoleon Facility. The investigation was conducted on December 2 and 3, 1999, in general accordance with HSG's letter proposal, dated November 5, 1999. The intent of the environmental investigation was to determine whether temporary on-site storage and handling of sludge from container manufacturing processes resulted in environmental impacts on soil and/or groundwater. Following is a project summary and descriptions of the field activities, methods, results, findings and recommendations.

Preliminary comparison of detected concentrations of VOCs with the generic residential cleanup numbers for RCRA closures suggest that soil concentrations of ethylbenzene, naphthalene, and xylenes in the shallow soil samples may exceed the generic values protective of groundwater.

5.0 CONCLUSIONS

HSI GeoTrans conducted a limited subsurface investigation at the Campbell Soup Company Napoleon facility. Based on our field observations and laboratory analysis, we conclude the following:

- The vertical and horizontal extent of VOCs in soil is limited and well defined. Approximately 300 to 700 cubic yards of soil are impacted. Therefore, excavation is an economically viable option. The disposal of soil off-site offers the benefit of immediate removal with no long term monitoring effort. However, off-site disposal carries the risk of future liability and simply transports the potential problem to another location.

- The maximum soil concentrations of ethylbenzene, naphthalene and xylenes were identified at 6 to 7 and 8 to 9 foot depths.

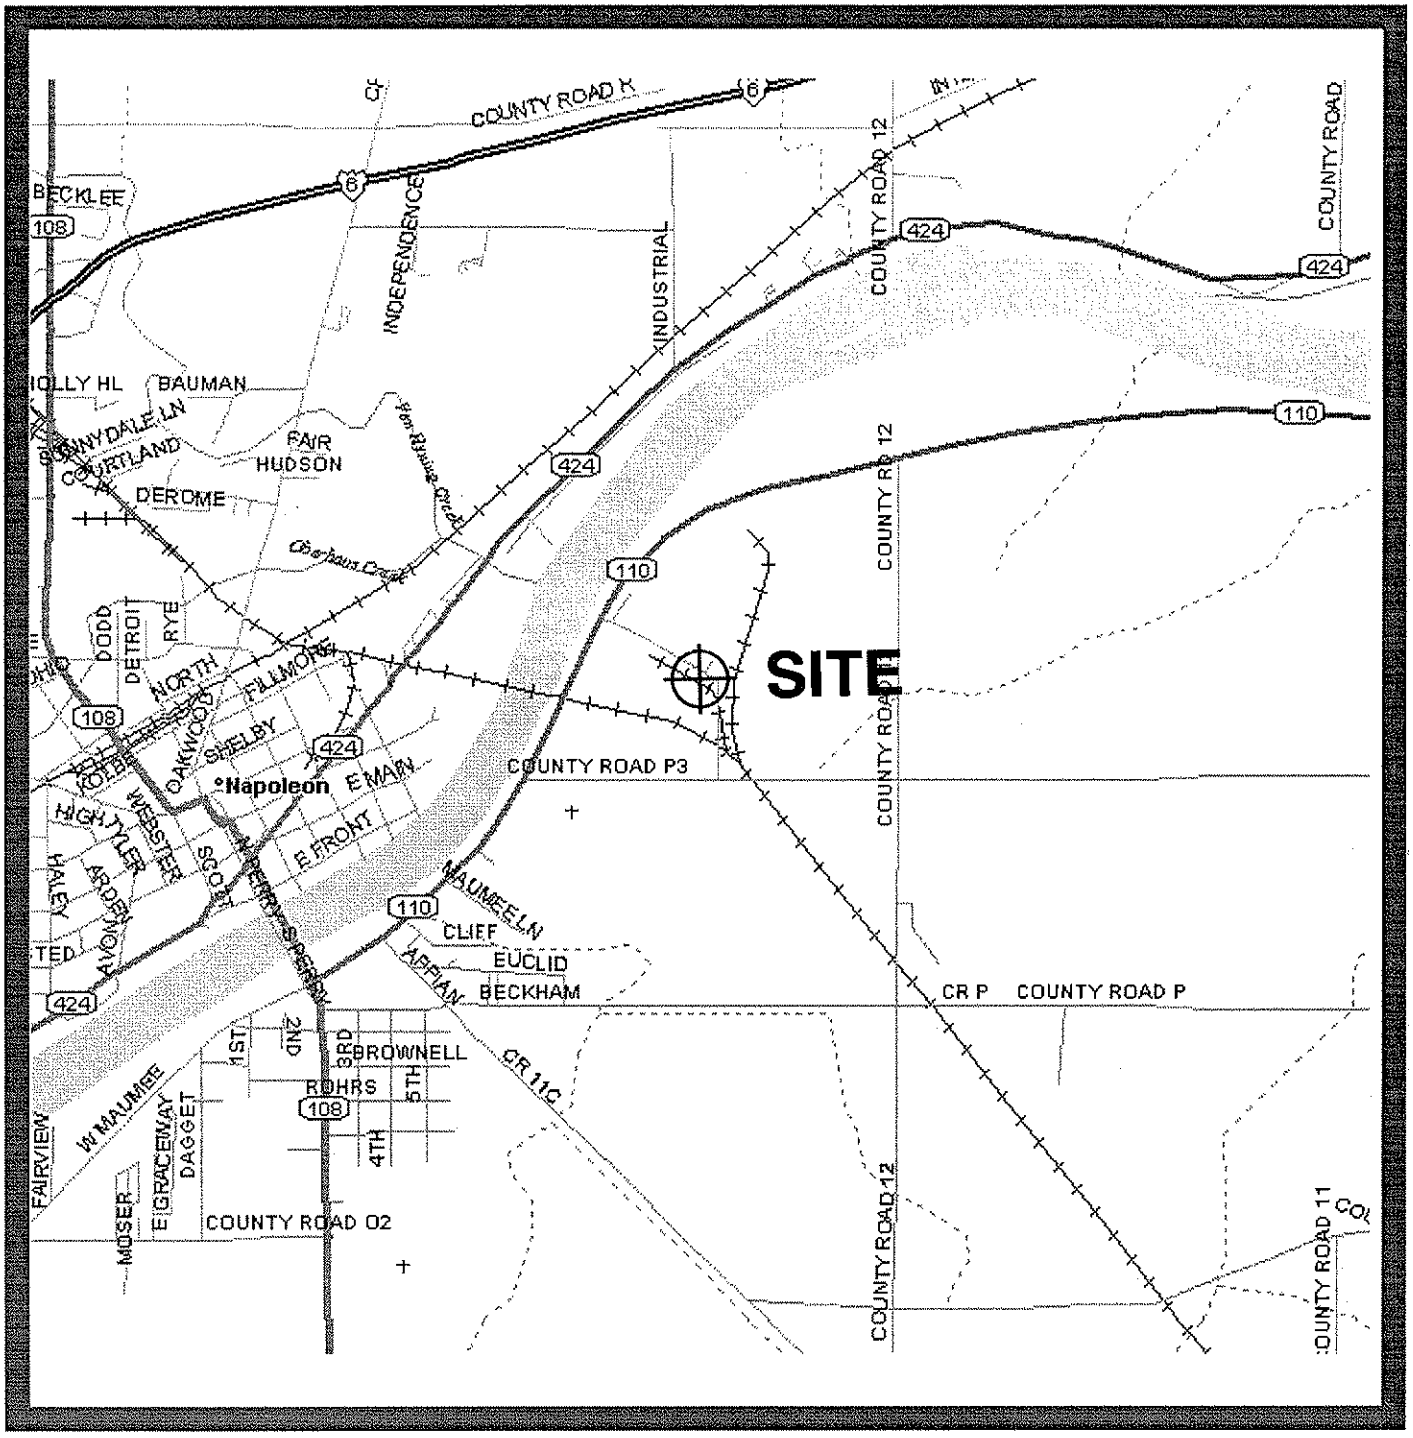
- MEK, acetone, ethylbenzene, MIBK, naphthalene, and xylenes were identified at 9.5 to 10 foot depths.

- The VOCs detected in the soil samples are amenable to bioremediation.

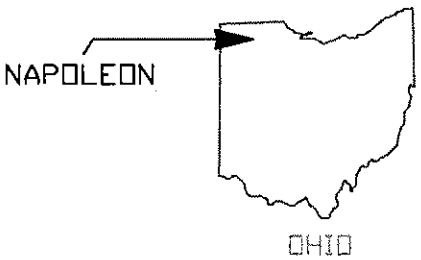
6.0 RECOMMENDATIONS

Based on our findings, HSI GeoTrans recommends the following:

- Calculate action/cleanup levels using the RBCA process with site specific parameters.



- Remediate soil beneath the former holding pit. Due to variable soil characteristics, excavate the soil for off-site disposal or ex-situ treatment.



- To minimize future liability, implement land treatment or biopiles on-site to remediate the soil.

- Following excavation, collect sidewall and floor soil samples for laboratory analysis and comparison to site-specific action/cleanup levels.

- Monitor bioremediation of the excavated soil to verify VOC remediation.

Notes:

1. Generic Residential cleanup criteria as listed in MDEQ Part 201Operational Memorandum #18, May 28,1999.
2. "ND" denotes not detected at or above the target method detection level ("TMDL")
3. "NA" = No criteria exists for this parameter
4. M = Calculated criterion is below the analytical Target Detection Limit (TDL)
5. W = Concentrations of Trihalomethanes in groundwater must be added together to determine compliance with State of Michigan Drinking Water Standard of 100 ug/L

Vinyl chloride	5	< 5
m & p-Xylenes	5	8.3
o-Xylenes	5	< 5 (3.1)

SURROGATES:

Compound	% Recovery	Acceptable Range
1,2-Dichloroethane-d4	94.2	70-121
Toluene-d8	95.2	81-117
4-Bromofluorobenzene	92.6	74-121

1) A value reported as "less than" indicates the analyte was not detected. The number is the quantification limit for the sample.

2) A value in parenthesis following a "less than" value indicates the analyte was detectable but below the limit of quantification. The value is an estimate only.

SAMPLE
DESCRIPTION: Campbell Soup - Water Treatment - PB-2 - 9.5-10' - Date Sampled: 12/02/99 @ 15:35

ANALYSIS: VOA

RESULTS: continued

COMPOUND	LOW LEVEL METHOD PQL (µg/Kg)	RESULT (µg/Kg)
1,1,2-Trichloro-1,2,2-Trifluoroethane (Freon 113)	5	< 5
1,2,3-Trichloropropane	5	< 5
Vinyl acetate	10	< 10
Vinyl chloride	5	< 5
m & p-Xylenes	5	< 5
o-Xylenes	5	< 5

SURROGATES:

Compound	% Recovery	Acceptable Range
1,2-Dichloroethane-d4	87.7	70-121
Toluene-d8	88.3	81-117
4-Bromofluorobenzene	91.3	74-121

1) A value reported as "less than" indicates the analyte was not detected. The number is th quantification limit for the sample.

SAMPLE DESCRIPTION: Campbell Soup - Water Treatment - ~~PB-15~~ - 6'-7' - Date Sampled: 12/03/99 @ 13:20

ANALYSIS: VOA

PROCEDURE: The sample was analyzed as outlined in US EPA "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, Third Edition, Method 8260B.

RESULTS:

COMPOUND	LOW LEVEL METHOD PQL (µg/Kg)	RESULT (µg/Kg)
Acrolein	50	< 5000
Acrylonitrile	50	< 5000
Acetone	50	< 5000
Benzene	5	< 500
Bromodichloromethane	5	< 500
Bromoform	5	< 500
Bromomethane	5	< 500
2-Butanone (MEK)	50	< 5000
Carbon disulfide	5	< 500
Carbon tetrachloride	5	< 500
Chlorobenzene	5	< 500
Chlorodibromomethane	5	< 500
Chloroethane	10	< 1000
2-Chloroethyl Vinyl Ether	10	< 1000
Chloroform	5	< 500
Chloromethane	5	< 500
1,2-Dibromoethane (EDB)	5	< 500
Dibromomethane	5	< 500
1,2-Dichlorobenzene	5	< 500
1,3-Dichlorobenzene	5	< 500
1,4-Dichlorobenzene	5	< 500
1,4-Dichloro-2-butene	10	< 1000
Dichlorodifluoromethane	5	< 500
1,1-Dichloroethane	5	< 500
1,2-Dichloroethane	5	< 500

date completed:	tech:	approved by:

SAMPLE
DESCRIPTION: Campbell Soup - Water Treatment - PB-20 - 6-7' - Date Sampled: 12/03/99 @ 13:35

ANALYSIS: VOA

PROCEDURE: The sample was analyzed as outlined in US EPA "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, Third Edition, Method 8260B.

RESULTS:

COMPOUND	LOW LEVEL METHOD PQL (µg/Kg)	RESULT (µg/Kg)
Acrolein	50	< 50
Acrylonitrile	50	< 50
Acetone	50	< 50
Benzene	5	< 5
Bromodichloromethane	5	< 5
Bromoform	5	< 5
Bromomethane	5	< 5
2-Butanone (MEK)	50	< 50
Carbon disulfide	5	< 5
Carbon tetrachloride	5	< 5
Chlorobenzene	5	< 5
Chlorodibromomethane	5	< 5
Chloroethane	10	< 10
2-Chloroethyl Vinyl Ether	10	< 10
Chloroform	5	< 5
Chloromethane	5	< 5
1,2-Dibromoethane (EDB)	5	< 5
Dibromomethane	5	< 5
1,2-Dichlorobenzene	5	< 25 *
1,3-Dichlorobenzene	5	< 25 *
1,4-Dichlorobenzene	5	< 25 *
1,4-Dichloro-2-butene	10	< 50 *
Dichlorodifluoromethane	5	< 5
1,1-Dichloroethane	5	< 5
1,2-Dichloroethane	5	< 5

date completed:	tech:	approved by:
12/16/99	JM	Edward Hurst

o-Xylenes	5	< 5

SURROGATES:

Compound	% Recovery	Acceptable Range
1,2-Dichloroethane-d4	94.9	70-121
Toluene-d8	89.3	81-117
4-Bromofluorobenzene	84.9	74-121

1) A value reported as "less than" indicates the analyte was not detected. The number is the quantification limit for the sample.

*2) A value reported as "less than" but at a higher value than the Method PQL has been elevated due to matrix effects.

3) A value in parenthesis following a "less than" value indicates the analyte was detectable but below the limit of quantification. The value is an estimate only.

SAMPLE DESCRIPTION: Campbell Soup - Water Treatment - PB-21 - 9.5-10' - Date Sampled: 12/03/99 @ 12:50

ANALYSIS: VOA

PROCEDURE: The sample was analyzed as outlined in US EPA "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, Third Edition, Method 8260B.

RESULTS:

COMPOUND	LOW LEVEL METHOD PQL (µg/Kg)	RESULT (µg/Kg)
Acrolein	50	< 50
Acrylonitrile	50	< 50
Acetone	50	54.4
Benzene	5	< 5
Bromodichloromethane	5	< 5
Bromoform	5	< 5
Bromomethane	5	< 5
2-Butanone (MEK)	50	< 50
Carbon disulfide	5	< 5
Carbon tetrachloride	5	< 5
Chlorobenzene	5	< 5
Chlorodibromomethane	5	< 5
Chloroethane	10	< 10
2-Chloroethyl Vinyl Ether	10	< 10
Chloroform	5	< 5
Chloromethane	5	< 5
1,2-Dibromoethane (EDB)	5	< 5
Dibromomethane	5	< 5
1,2-Dichlorobenzene	5	< 5
1,3-Dichlorobenzene	5	< 5
1,4-Dichlorobenzene	5	< 5
1,4-Dichloro-2-butene	10	< 10
Dichlorodifluoromethane	5	< 5
1,1-Dichloroethane	5	< 5
1,2-Dichloroethane	5	< 5

date completed:	tech:	approved by:
12/16/99	JM	Edward Jhrett

1.0 INTRODUCTION

1.1 Site Description

The Campbell Soup Company Napoleon facility is located on the south side of East Maumee Avenue, Napoleon, Henry County, Ohio. The facility is located at the southeast edge of Napoleon, on the south side of the Maumee River (Figure 1). The former sludge-holding pit, located in the area identified in Figure 2, was the subject of this investigation.

1.2 Site History

Prior to using the former holding pit, spent solvent from the former can manufacturing operations was stored in 55-gallon drums and eventually used as a boiler fuel supplement (Boiler and Industrial Furnace 'BIF' Small Quantity Burner Exemption). Over time, solids accumulated in the drums, making handling of the spent solvents and drums difficult. To alleviate the solids problem, a temporary holding pit was constructed to receive and dry solids prior to off-site disposal. The pit was constructed atop an elevated area consisting of fill from other parts of the facility. Locally obtained clay was used to construct containment dykes and to line the pit. The clay was compacted to reduce its permeability. The overall dimensions of the holding pit were approximately 20 feet wide by 35 feet long, and 2 ½ feet deep.

Semi-solid residues from the solvent drums were placed in the former holding pit and mixed with sand to reduce the moisture content of the material prior to off-site disposal. This practice was discontinued and the partially filled pits were decommissioned in 1983. A local contractor excavated the dykes and hauled the material to the Evergreen Landfill for disposal. The excavated area was filled with an additional 4- to 5-feet of new sand and natural soil fill material.

The earthen dikes were a one-time construction to remove semi-liquid solids from the drums. The practice was discontinued in 1983 with the excavation of the dikes. Because the solids and sludge materials temporarily placed in the holding pit were potentially exposed to volatile organic compounds (VOCs), a limited subsurface soil investigation was performed at the former holding pit area.

The results of the subsurface investigations were documented in the HSI GeoTrans, Inc. report entitled, "Limited Subsurface Soil Investigation", dated February 16, 2000 (previous

investigation). The principle finding of the limited subsurface investigation is that VOCs do exist in the subsurface soils. This report was submitted to the Ohio EPA for review.

1.3 Purpose and Scope

The purpose of this work plan is to outline the tasks required to complete the subsurface investigation at the former holding pit area for the Campbell Soup Company Facility in Napoleon, Ohio. The scope of work proposed in this RCRA Site Closure Investigation Work Plan will be conducted to satisfy the Order of the Ohio EPA concerning closure of the former pit area. Closure of the former pit will be conducted in accordance with OAC Rules 3745-55-11/3745-66-11 through 3745-55-20/3745-66-20. Comments relating to the previous investigation provided by the Ohio EPA in a letter dated May 16, 2000, have been considered in preparation of this work plan.

In addition, this work plan replaces and supercedes an earlier June 26, 2000, work plan submitted to the Ohio EPA for review and comment. Ohio EPA comments relating to that earlier work plan (draft letter dated August 10, 2000) have been considered in the scope revisions provided in this more recent submittal. Copies of Ohio EPA correspondence providing comments on the investigation or earlier work plans are provided as Appendix A.

2.0 DESCRIPTION OF CURRENT SITE CONDITIONS

2.1 Chemicals of Concern

The materials stored in the former holding pit generally were associated with wastes recovered from the enamel coating process for the inside of food containers. According to the Material Safety Data Sheets (MSDS) provided for these enamels (copies submitted to OEPA on April 20, 2000), the chemical constituents that may have been present in the waste materials stored in the holding pit include the following:

Alcohols	- n-butanol
Ethers	- diethyl glycol monobutyl ether - ethylene glycol monobutyl ether - glycol ether - propylene glycol methyl ether
Ketones	- cyclohexanone - 2-butanone (MEK) - methyl isobutyl ketone (MIBK)
Formaldehyde	
Xylenes	

Chemicals that were actually detected in soils under the former holding pit during the limited soil investigation include the following:

Acetone

2-Butenone (MEK)

1,4-Dichlorobenzene (at concentrations below the practical quantification limit (PQL))

Ethyl benzene

4-methyl-2-pentanone (MIBK)

Naphthalene

Toluene (at concentrations below the PQL)

Xylenes

Although there is no indication that semi-volatile organic compounds (SVOCs) were constituents of the materials stored in the former holding pit, the Ohio EPA has requested that their presence be evaluated at this site. The occurrence of naphthalene in soil samples indicates that simple polynuclear aromatic compounds are present.

2.2 Site Surface Conditions

The former holding pit was constructed atop a mound created from fill soils transported from other grading or excavation activities at the facility. The pit was decommissioned and the dykes leveled prior to adding an additional 4 feet of new fill material over the former pit location. The elevated mound upon which the pit was located is currently 15 to 20 feet above natural grade. Therefore, the former holding pit, while active, was approximately 11 to 16 feet above natural grade.

The current area where the former pit area was located is currently vacant and partially grass-covered. Several trees are located near the margins of the elevated fill area beyond the limits of the former holding pit.

2.3 Site Geology

Geoprobe$_{TM}$ borings completed in the former holding pit area during the previous investigation primarily identified the lithology as fill with varying amounts of clay till, silt and some sand. Other soil borings advanced by Campbell Soup Company in other parts of the facility reportedly encountered stiff clay at 4 feet below the natural grade. This clay is reportedly at least 10 feet in thickness. The high clay content of the local sediments is consistent with the former flood plain and glacial lacustrine deposits that characterize this part of Henry County. The bedrock located beneath the clay-rich surfical deposits is comprised of Devonian Aged shale and carbonates. The local depth to bedrock has not yet been determined.

2.4 Site Hydrogeology

The depth to groundwater at the site was not determined during the previous limited soil investigation. However, publications available through the Ohio State University Extension program indicate that groundwater in Henry County is obtained primarily from a carbonate aquifer located beneath 40 to 85 feet of glacial drift. The City of Napoleon uses surface water obtained from the Maumee River as its public water supply source.

2.5 Nature and Extent of Impacts in Soil

Soil screening using a photoionization detector (PID) identified organic vapors in soil under the former holding pit, and follow-up sampling verified the presence of several specific volatile Organic Compounds (VOCs)[1]. The following compounds were identified above the laboratory method PQLs during the previous investigation: acetone, ethyl benzene, MEK, MIBK, naphthalene, and xylene. Toluene and 1,4-dichlorobenzene were also detected at concentrations below the laboratory method PQLs. The highest concentrations of VOCs were reported from 6 to 9 feet below surface grade (bsg). The photoionization detector (PID) identified organic vapors between about 2 and 9 feet bsg. The approximate horizontal extent of the contaminated area is approximately 60 by 60 feet. The vertical distribution and the horizontal extent of the contaminated area to the northwest was not fully determined during the previous investigation.

2.6 Site Conceptual Model

The native soil under the area of investigation consists primarily of stiff clay and sandy clay deposits. The area under the former holding pit consists of fill materials imported from other locations in the facility, and is elevated above natural grade. The former holding pit was excavated into this non-native fill, and used for approximately 2 years to temporarily hold semi-solid wastes prior to off-site disposal. Sand was mixed with the sludge to decrease the moisture content prior to disposal. When the pit was abandoned, the contents and clay dykes and liner were removed, and the pit side-walls pushed into the pit bottom. The area was re-graded and approximately four feet of fill placed over the former pit area. Some of the mixing sand may have been regraded into the fill, possibly producing thin and isolated soil layers with higher relative permeability. Additional fill has been placed over the former holding pit area since the pit was demolished.

Based on conversations with plant personnel and the soil profile observed during the previous limited soil investigation, the area formerly occupied by the holding pit has the following general lithologic profile:

- From 0 to 4 feet below grade – more recent fill material consisting of clay, cinder, and construction debris.
- From 4 feet to 6 feet below grade – mixed materials consisting of the former collapsed pit berms and sand used for mixing.

- From 6 feet to about 15 feet below grade - older (pre-holding pit) fill material consisting of clay with some sand or silt and some cinders.
- From about 15 feet to more than 20 feet below grade - native clay and fine textured sediments

A schematic cross sectional representation of the former holding pit is provided as Appendix B. Based on this generalized lithologic description and cross sectional profile, it is expected that chemical concentrations associated with the materials stored in the former holding pit will occur at the highest concentrations in the horizon associated with the bottom of the former clay pit, or at 6 to 8 feet below the current ground surface. This horizon contains the most sand and may be most permeable. Concentrations should decrease with depth, depending on the effectiveness of the clay liner and clay content of the underlying fill. The underlying clay-rich native soil should act as a barrier to continued vertical migration. Some leakage through the clay liner could have occurred during the two years of pit activity if the clay liner possessed inhomogeneities, fissures or other structural weaknesses, or if the clay's permeability was affected by chemical interactions.

[1] Limited Subsurface Soil Investigation, Former Holding Pit Area, February 16, 2000, HSI GeoTrans

3.0 IDENTIFICATION OF REMAINING DATA NEEDS

3.1 Local Occurrence of Groundwater

Groundwater was not encountered in any boring completed in the preliminary soil investigation. Borings were advanced to a depth of 12 feet below grade with no observed soil saturation. Any moisture observed in soils is due to transient water, as the borings were generally too shallow to extend below the natural grade.

Information related to groundwater under the facility is not readily available. The Henry County Health Department was contacted to obtain general information relating to local groundwater availability. Few water users obtain water from groundwater resources in the area. Most water supply systems obtain surface water from the Maumee River. Private wells may be present beyond the limits of the Napoleon water supply distribution system. Additional file review and record acquisition efforts are required to further evaluate the water bearing formations, the depth to groundwater, the direction of groundwater movement, and the potential for groundwater to be affected by the soil conditions under the former pit area.

The potential for groundwater impact will depend on the penetration depth of infiltrating chemicals. If the vertical extent of contamination is limited to soil above natural grade, then groundwater cannot be affected and groundwater occurrence is irrelevant. If soil contaminants extend into the natural soils below natural grade, then additional shallow hydrogeological information will be required.

3.2 Vertical and Horizontal Extent of VOCs in the Area of Impact

During the limited subsurface soil investigation, soil samples were screened for organic vapors using a PID, and select soil samples were collected and analyzed in a laboratory for VOCs. VOC samples were obtained from a uniform depth of approximately 10 feet in all borings, and from approximately 6 feet in several borings with high relative concentrations. This work was appropriate for identifying whether an environmental issue existed, what concentrations were present, and for estimating the approximate volume of affected soil. However, it did not satisfy the criteria for delineating soil and groundwater conditions as part of a RCRA closure investigation.

To adequately characterize the soil contamination, additional soil samples need to be collected. PID data is useful for screening soil samples, but is not an acceptable method for conducting a RCRA closure investigation. The sample boring grid spacing was satisfactory, but the vertical distribution of VOCs in each boring was not sufficiently evaluated. In addition, horizontal delineation was not completed to the north and west of the main grid. Therefore, additional soil samples must be collected from various depth intervals in and around the former holding pit to characterize the soil contamination and determine the vertical and horizontal extent of VOCs under and around the former holding pit.

3.3 Occurrence of SVOCs in the Area of Impact

The Ohio EPA requested that the soil under the former holding pit be evaluated for semi-volatile organic compounds (SVOCs). SVOCs are not expected to be a major constituent of the wastes stored temporarily in the former holding pit – however, the occurrence of naphthalene suggests that SVOC evaluation may be warranted. Additional soil samples need to be collected throughout the sampling area to determine whether SVOCs are present, and whether they will be a factor in determining future remediation strategies or action plans.

4.0 SCOPE OF WORK

4.1 Determine the Local Occurrence of Groundwater

The local occurrence of groundwater will be determined by obtaining and reviewing readily available hydrogeological references and reports, geological references and reports, and other documents available through the Ohio EPA, Henry County, academic institutions, and other sources.

Local area well records will be obtained from the Ohio EPA and the Henry County Health Department to evaluate the location of water supply wells, the formations supplying water to wells, the depth to groundwater, and if possible, the general direction of groundwater flow.

If the soil probes indicate that soil contamination is limited to the fill material, and does not extend below the natural grade level, then no additional groundwater investigation will be required. If the soil borings extend below natural grade, then soil borings will be observed for 15 to 30 minutes to determine whether water enters the boring. In this event, a sample of the groundwater will be collected and additional groundwater investigation activities will be necessary.

4.2 Determine the Vertical and Horizontal Extent of VOCs in Soil Under and Surrounding the Former Holding Pit

Approximately twenty-two Geoprobe$_{TM}$ soil borings will be advanced in and around the area previously investigated during the limited subsurface soil investigation (Figure3). Samples will be collected from these borings from depths of approximately 3, 6, and 12 feet below grade to evaluate the vertical distribution of VOCs in and around the known affected area. An additional deeper sample will be collected from each boring at depths of approximately 14 feet and held at the laboratory for later evaluation, pending the results of the 12-foot sample analysis. Samples will not be collected from depths shallower than 3 feet because this soil consists of fill material which post dates the demolition and re-grading of the former holding pit.

4.3 Determine Whether SVOCs are Present in Soil Under the Former Holding Pit

To address the Ohio EPA request for evaluating SVOCs in soil, samples will be collected from the 3, 6 and 12 foot intervals at each boring indicated in Figure 3. A sample will also be collected

from the 14 foot depth interval and held for possible later evaluation. These samples will be analyzed for semi-volatile aromatic compounds; specifically the polynuclear aromatic compounds (PNAs).

5.0 METHODS AND PROCEDURES

The sample collection and handling procedures described below will be used to implement the scope of work presented in this work plan. A mobile laboratory will be used to obtain immediate-to-short turn around analytical results and SVOC will be analyzed in addition VOCs. The EPA Method 5035 (field methanol preservation) procedure will not be used during this investigation phase of this work plan because it will negatively affect the detection limits of the on-site mobile laboratory apparatus.

With the exception of the use of a mobile laboratory and the evaluation of SVOCs, the methods and procedures described below are the same as those implemented during the previous investigation activities described in the Limited Subsurface Soil Investigation, dated February 16, 2000.

5.1 Soil Borings

Soil borings will be advanced to a total depth of 14 feet using Geoprobe$_{TM}$ direct push methods. The sample will be collected in four-foot long 2-inch diameter macro-sampler core barrels lined with clear PVC sampling sleeves. A clean stainless steel knife will be use to dissect the liner to extract the sample for evaluation. Part of the sample will be field screened using a PID. Soil samples representative of the depth intervals identified in Section 4 of this document will be collected using a clean wood or stainless steel spatula and submittal to an on-site mobile laboratory technician for VOC and/or SVOC (PNA) analyses.

5.2 Sample Handling and Analyses

Probe rods will be decontaminated between borings using Liquinox detergent and rinsed with clean deionized water. All tools used to extract the soil samples from the sampling tubes will be cleaned using a Liquinox detergent solution and rinsed with de-ionized water prior to collecting each sample. Decontamination fluids and rinses will be disposed at the facility waste water treatment plant. New latex gloves will be worn by the sampling personnel and changed between sample collection events.

Samples will be placed in pre-labeled containers provided by the mobile laboratory technician. Each container will be specifically marked for the parameter to be analyzed. Sample preservatives (if necessary) will be pre-measured and placed into the sample containers by the mobile laboratory tachnician. Each sample container will have a label to record the sample

identification, sample depth, sample date and time, parameter(s) for analysis, person collecting the sample, and other pertinent data. Once filled, sample containers will be placed in a chilled insulated cooler until it is extracted and loaded into the mobile laboratory GC/MS. Sample information and handling history will be documented on laboratory supplied chain-of-custody forms.

Samples will be analyzed in mobile laboratory units provided and operated by New Age/Landmark Mobile Laboratory Services, of Benton Harbor, Michigan. QA/QC Plan document can be submitted to the Ohio EPA upon request.

Volatile organic compounds will be analyzed by GC/MS using EPA Method 8260. Semi-volatile organic compounds will be analyzed using EPA Method 8270.

6.0 HEALTH AND SAFETY PLAN

Prior to initiating field activities, a Site Health & Safety Plan will be prepared in accordance with OSHA, 29 CFR 1910.120. The Site Health & Safety plan will be provided to any subcontractor involved in the on-site implementation of this work plan. An on-site meeting will be held with contractors prior to initiating field activities to ensure they understand the potential hazards associated with the implementation of this work plan.

The Health & Safety plan document will include the following information:

- Key personnel and responsibilities
- Training and medical Surveillance Requirements
- Site Description
- Work Objectives
- Hazard evaluation
- Air monitoring
- Personal protective equipment
- Decontamination and site control procedures
- Residuals management
- Emergency information and contacts
- Contingency plan for emergencies
- Spill containment procedures, and
- Confined space entry procedures

7.0 PROJECT SCHEDULE

The following schedule is proposed for this scope of work:

Activity	Days from Receipt of OEPA Approval
Complete Site Health & Safety Plan	15
Complete field sampling	45
Evaluate data	60

May 16, 2000

Mr. Michael Maringer
Manager, Service and Utilities
Campbell's Soup Company
East Maumee Avenue
Napoleon, Ohio 43545

Dear Mr. Maringer:

On March 23, 2000, this office received a report from Campbell's Soup Company (Campbell's) entitled Limited Subsurface Soil Investigation: Former Holding Pit Area. Ohio EPA has reviewed the document and offers the following comments:

1. Campbell's has not identified the full horizontal range of contamination. Sample data submitted shows the majority of samples were taken at depths of 9.5 to 10 feet, with no samples taken from 0 to 6 feet. It is possible that contamination exists in more shallow soils beyond the boundaries of Campbell's sampling. Therefore, a more complete investigation needs to be conducted. Samples must be taken from the 0 to 2 and 2 to 4 foot depth intervals. A map showing proposed sampling locations must be submitted to Ohio EPA, NWDO prior to sampling.

2. No details of how the samples were taken (other than saying samples were taken with a Geoprobe) is included in the report. Sampling protocol information must be provided to Ohio EPA in future submissions.

3. No semi-volatile organic compounds (SVOCs) were targeted as a result of this investigation. Campbell's should explain the reason for their absence.

4. On page 3-1, Campbell's states that soil samples were collected from the 9.5 to 10 foot depth interval. As the material was supposed to have been applied approximately 2.5 feet below grade, it would seem that shallow soil samples should have been taken. Shallow soils must be addressed by Campbell's during the RCRA closure process. Samples must be taken at the 0 to 2 and 2 to 4 foot intervals, at a minimum. Sampling location points should be submitted to Ohio EPA for approval prior to sampling.

Printed on recycled paper

MAY 19 '00 16:50 FR ACCT PAYABLE CSC NAP0419 599 6669 TO 917342135008 P.02/03

** TOTAL PAGE.03 **

5. On page 4-1, Campbell's states that depth to groundwater was not determined, but that a literature review indicates Henry County's groundwater is primarily obtained from a carbonate aquifer located beneath 40 to 85 feet of glacial drift.

   A more thorough groundwater investigation must be performed. In the future, Campbell's must check for saturated conditions in the Geoprobe boreholes. Campbell's must also check Ohio Department of Natural Resources (ODNR) well log locations within a one mile radius of the former holding pit area. When a formal RCRA closure is performed, if soil contamination exists at or below saturated soil conditions, groundwater samples will need to be collected.

6. On page 4-4, Campbell's discusses Ohio EPA's draft guidelines for single chemical clean-up numbers for RCRA closures to generic residential standards. While these draft guidelines do exist, they are not applicable to this project because they do not account for cumulative effects from multiple chemicals, such as those in the former holding pit.

7. On page 6-1, HSI GeoTrans (the developers of this document), recommends calculating action/clean-up levels using the Risk Based Corrective Action (RBCA) process with site specific parameters. As this unit will need to undergo formal RCRA closure, this approach is not acceptable.

8. Appendix A shows that borings were advanced to a depth of 12 feet. However, no samples were submitted from depths greater than 10 feet. Campbell's should explain the rationale behind this approach.

This review should not be construed to constitute a complete review of Campbell's closure plan for the former holding pit area. The plan will be addressed in detail in future correspondence. This review did not include joint review by Ohio EPA's Division of Drinking and Ground Waters. If you have any questions, feel free to contact me.

Sincerely,

Michael R. Terpinski
Division of Hazardous Waste Management

Re: Henry County
Campbell's Soup Company
OHD 005419171
Hazardous Waste

August 10, 2000

Mr. Michael Maringer
Manager, Service and Utilities
Campbell's Soup Company
East Maumee Avenue
Napoleon, Ohio 43545

Dear Mr. Maringer:

On June 30, 2000, this office received a report from Campbell's Soup Company (Campbell's) entitled RCRA Site Closure Investigation Work Plan: Former Holding Pit Area. Ohio EPA has reviewed the document and offers the following comments:

1. Campbell's has not identified the full horizontal or vertical range of contamination. Sample data submitted shows the majority of samples were taken at depths of 9.5 to 10 feet, with no samples taken from 0 to 6 feet. It is possible that contamination exists in more shallow soils beyond the boundaries of Campbell's sampling. Therefore, a more complete investigation needs to be conducted.

   Samples at each prior boring must be taken at shallower depths than 10 feet. It is probable that contamination may exist in soil at depths from 6-8 feet, for example, but not at 10 feet. For this reason, a non-detect value at 10 feet alone cannot be used to determine the horizontal extent of contamination. Taking samples from 3, 6, and 12 feet below grade is acceptable. However, the deeper sample to be held at the laboratory should be taken at from 14, not 16, feet.

2. Only advancing additional borings at sample numbers PB-23 through 26 is unacceptable. The full vertical extent of contamination from the former holding pits must be defined. The highest concentrations of contaminants could be found in soils between 4 to 8 feet below grade, yet the work plan only calls for additional sampling at 9 borings. Samples from all previous and future sampling points must be taken from 3, 6, 12 (9-10 foot interval having already been sampled), and 14 feet below grade.

3. Campbell's proposal to remove contaminated soils to another unimpacted area for the purpose of phytoremediation is not acceptable to Ohio EPA. The placement of soils from the former holding pit area onto unimpacted ground would constitute creation of a waste pile and require the submission of a RCRA Part B permit application for the waste pile.

4. No details of how the samples were taken (other than saying samples were taken with a Geoprobe)is included in the report. Sampling protocol information must be provided to Ohio EPA in future submissions. Sampling results without this information will not be accepted for closure purposes.

5. The presence of naphthalene (a common ingredient in many industrial solvents) in samples from the December, 1999 sampling event indicates semi-volatile organic compound (SVOCs) contamination. All samples should be analyzed for the presence of SVOCs as well as VOCs.

6. Figure 4 of the February 2000 limited investigation document does not include all soil contamination listed in Table 2 of said document. Acetone was found at 70.6 ug/kg at PB-17 and 63.5 ug/kg at PB-12; methyl ethyl ketone was found at 62.6 ug/kg at PB-11; total xylenes were found at 11.4 ug/kg at PB-01 and 38.4 (at 10 feet) at PB-15; ethylbenzene was found at 9.1 ug/kg (at 10 feet) at PB-15.

7. The sections dedicated to site geology and hydrogeology (section 2.3 and 2.4) will need to be much more detailed in the closure plan. For example, Campbell's must determine occurrence of the uppermost saturated unit-i.e. the occurrence of saturated conditions below the unit.

8. Campbell's must determine the vertical impact of soil contamination. Campbell's should leave the borings in the unit open to allow for infiltration of groundwater, if any. This would go to prove the occurrence of shallow groundwater.

9. If soil is impacted at concentrations greater than the Method Detection Limit (MDL) for VOCs at or below the shallow groundwater table, a complete groundwater investigation must be performed.

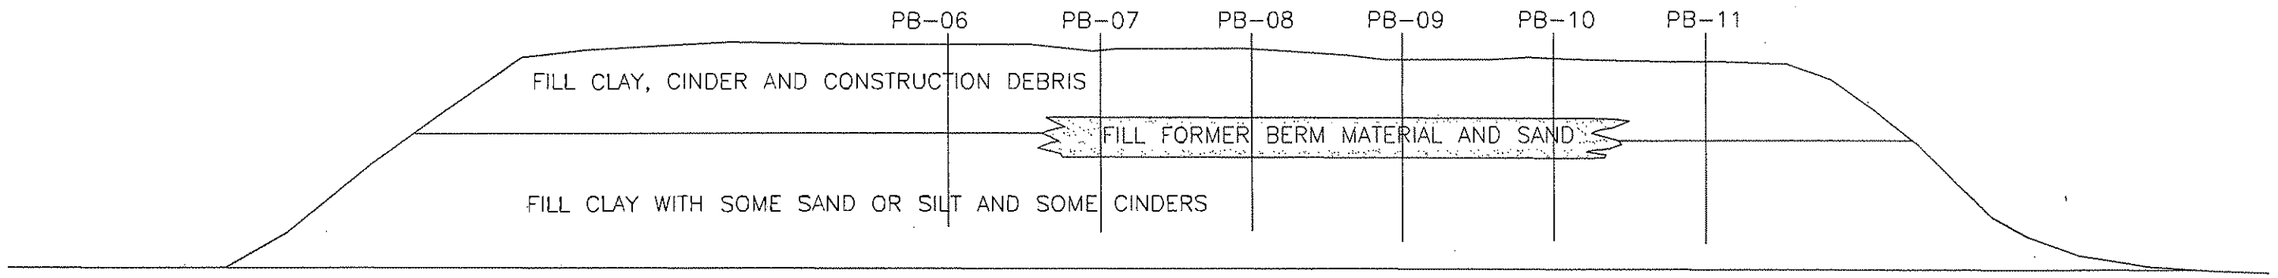
10. Section 3.1 of the work plan states that groundwater was not encountered in any borings at 12 feet. Campbell's should explain what evidence this conclusion is based upon.

11. A literature search is insufficient to determine local occurrence of groundwater. Campbell's must perform more sampling and obtain site specific information for the occurrence of groundwater.

12. Campbell's should be prepared to collect groundwater samples from the Geoprobe borings for VOCs and SVOCs, if groundwater occurs.

This review should not be construed to constitute a complete review of Campbell's closure plan for the former holding pit area. The plan will be addressed in detail in future correspondence. This review did not include joint review by Ohio EPA's Division of Drinking and Ground Waters. If you have any questions, feel free to contact me.

Sincerely,



Michael R. Terpinski

1.0 GENERAL

1.1 Purpose and Scope

The purpose of this work plan is to outline the tasks required to close a former holding pit area for the Campbell Soup Company Facility in Napoleon, Ohio. The Ohio Environmental Protection Agency (OEPA) issued an Order to Campbell Soup Company and Campbell Soup Supply Company, LLC, to properly close the former holding pit area at the Napoleon Facility, located at 1273 State Route 110, Napoleon, Ohio. This Closure Plan is submitted to fulfill the requirements of the Order. The Campbell Soup Company Napoleon Plant is registered as a small quantity generator under RCRA, and does not operate other hazardous waste transportation, storage of disposal facility (TSDF) units on this property.

1.2 WASTE CHARACTERIZATION

THE WASTES THAT WERE PLACED IN THE HOLDING PIT WERE SEMI-SOLID SLUDGES ASSOCIATED WITH COATING MATERIALS AND SOLVENTS USED IN THE CAN MANUFACTURING FACILITY. THE OHIO EPA HAS ASSIGNED THE WASTE CODE D001 TO THIS SITE DUE TO THE NATURE OF THE ORIGINAL WASTES TEMPORARILY STORED IN THE HOLDING PIT. SOILS THAT HAVE COME INTO CONTACT WITH THESE WASTES ARE NOT CURRENTLY EXPECTED TO BE HAZARDOUS. SOIL SAMPLES WILL BE COLLECTED TO VERIFY THE SOIL IS NON-HAZARDOUS, AS DESCRIBED IN SECTION 14.4.

2.0 DESCRIPTION OF FACILITY

2.1 Site Description

The Campbell Soup Company Napoleon facility is located on the south side of East Maumee Avenue, Napoleon, Henry County, Ohio. The facility is located at the southeast edge of Napoleon, on the south side of the Maumee River (Figure 1). The former sludge-holding pit, located in the area identified in Figure 2, was the subject of this investigation.

The facility is involved with the processing, packaging, and distribution of food goods. The facility occupies 742 acres: 679 acres are used for agriculture and spray irrigation, 55 acres are "under roof" or occupied by buildings, and 8 acres are paved or open areas. The "under roof" areas include the beverage plant facilities (305,650 square feet (sq. ft.)), the main plant facilities (1,670,000 sq. ft.) and other miscellaneous buildings (40,000 sq. ft.).

The area breakout for the main plant is summarized below:

Manufacturing	951,176-sq. ft.
Warehouse	572,000-sq. ft.
Office Space	98,051-sq. ft.
Boiler House	21,639-sq. ft.
Water Plant	19,328-sq. ft.
Waste Water Treatment Plant	7,806-sq. ft.

The wastes associated with the former holding pit consisted of spent coating materials and solvents that were used in the can manufacturing facility at the site. Prior to 1981, spent coating materials and solvents from the former can manufacturing operation were stored in 55-gallon drums and eventually used as a boiler fuel supplement (Boiler and Industrial Furnace 'BIF' Small Quantity Burner Exemption). Over time, solids accumulated in the drums, complicating handling of the spent solvents and drums. To manage the solids, a temporary holding pit was constructed to receive and dry the solids prior to off-site disposal.

The former drying pit was constructed on top of an elevated area consisting of fill from other parts of the facility. Local clay was used to construct containment dikes and to line the pit. The clay was compacted to reduce its permeability. The overall dimensions of the holding pit were approximately 20 feet wide by 35 feet long, and 2 ½ feet deep.

Semi-solid residues from the solvent drums were placed in the former holding pit and mixed with sand to reduce the moisture content of the material prior to off-site disposal. The holding pit was active from 1981 until it was demolished in 1983. A local contractor excavated the dikes forming the pits and transported the dried material to the Evergreen Landfill in Bedford, Ohio, for disposal. The excavated area was filled and covered with an additional 4- to 5-feet of new sand and natural soil fill material.

Because the solids and sludge materials temporarily placed in the holding pit contained volatile organic compounds (VOCs), a limited subsurface soil investigation was performed at the former holding pit area. The results of the subsurface investigations were documented in the HSI GeoTrans, Inc., report, Limited Subsurface Soil Investigation, dated February 16, 2000 (preliminary investigation). This limited subsurface investigation identified VOCs in subsurface soils. The report was submitted to the OEPA for review on March 26, 2000.

The OEPA requested follow-up investigation in a letter dated May 16, 2000. A work plan proposing soil and groundwater delineation activities was submitted to the OEPA on October 1, 2000. The work plan was approved in correspondence dated April 3, 2001, and a formal RCRA Closure Plan was requested. In meetings to discuss the closure plan, the OEPA requested that semi-volatile organic compounds (SVOCs) analysis be included, based on the earlier detection of naphthalene.

The additional investigation activities were conducted during the week of May 21, 2001. This investigation confirmed that VOCs were present, and determined that SVOCs were also present in the subsurface soils. The extent of soil impact was determined to be much larger than the physical limits of the former holding pit.

3.0 MAP OF FACILITY

A map showing the location of the facility and its relationship to other local landmarks is presented as Figure 1. A detailed facility map, produced from an aerial photograph, is provided as Figure 2. Figure 2 identifies the location of the former holding pit within the facility. The Maumee River is approximately 1,150 feet northwest of the former holding pit.

4.0 DESCRIPTION OF HAZARDOUS WASTE MANAGEMENT UNITS TO BE CLOSED

4.1 Site Surface Conditions

The former holding pit was constructed on top of a mound created from fill soils transported from other grading or excavation activities at the facility. The pit was decommissioned and the dikes leveled prior to adding an additional 4 feet of new fill material over the former pit location. The elevated mound upon which the pit was located is ~~currently~~ APPROXIMATELY 20 ~~to 25~~ feet above natural grade. Therefore, the former holding pit was approximately 11 ~~to 16~~ feet above natural grade during its active phase.

The area where the former pit area was located is currently vacant and partially grass-covered. Several trees are located near the margins of the elevated fill area beyond the limits of the former holding pit.

Topography across the facility is generally flat. Drainage is toward the northwest, to the Maumee River. MORE DETAILED SITE SPECIFIC TOPOGRAPHIC INFORMATION WILL BE OBTAINED DURING THE FIELD WORK OUTLINED IN THIS CLOSURE PLAN.

4.2 Site Geology

Geoprobe™ borings were completed in the former holding pit area during the preliminary remedial investigation. Based on information from these borings, the lithology of the mound can be characterized as fill with varying amounts of clay till, silt and some sand. Several distinct cinder or ash layers, up to 6-inches thick, were identified in the subsurface. These cinder/ash deposits are associated with residue from the on-site boiler operations.

Borings advanced by Campbell Soup Company in other parts of the facility reportedly encountered stiff clay at ~~4~~ 3.5 feet below the natural grade. This clay was observed to be at least ~~1~~20 feet thick. The high clay content of the local sediments is consistent with the former flood plain and glacial lacustrine deposits that characterize this part of Henry County. The bedrock located beneath the clay-rich surfical deposits is comprised of Devonian Aged shale and carbonates. The local depth to bedrock has not yet been determined.

4.3 Site Hydrogeology

DUE TO THE LACK OF A SUITABLE AQUIFER, THE CITY OF NAPOLEON USES SURFACE WATER OBTAINED FROM THE MAUMEE RIVER AS ITS PUBLIC WATER SUPPLY. HENRY COUNTY'S PRIMARY GROUND-WATER SOURCE IS A CARBONATE AQUIFER THAT IS COMPOSED OF LIMESTONE AND DOLOMITE. THIS AQUIFER IS LOCATED BENEATH 40 TO 85 FEET OF GLACIAL DRIFT. WELLS DEVELOPED AT DEPTHS EXCEEDING 200 FEET MAY YIELD IN EXCESS OF 150 GALLONS PER MINUTE (GPM) IN THE SOUTHERN AND EASTERN PARTS OF THE COUNTY. THE SECOND MOST COMMON GROUND-WATER SOURCE IS THE SAND AND GRAVEL AQUIFER WHICH IS PRODUCTIVE IN THE CENTRAL AND NORTHWEST PARTS OF THE COUNTY. IN THIS REGION, THIN LENSES OF SAND AND GRAVEL ARE LOCATED BENEATH THICK LAYERS OF FINE SAND AND SILTY CLAY; WELL YIELDS ARE LESS THAN 10 GPM. [1]

WELL LOG AND DRILLING REPORTS WERE OBTAINED FROM THE OHIO DEPARTMENT OF NATURAL RESOURCES (ODNR) FOR ALL WATER SUPPLY WELLS LOCATED WITHIN 1 MILE OF THE STUDY AREA (APPENDIX E). THE SEARCH CONDUCTED BY THE ODNR IDENTIFIED FIVE WATER SUPPLY WELLS WITHIN ONE-MILE OF THE STUDY AREA. THREE OF THE FIVE REPORTS INDICATE THAT A SAND AND GRAVEL UNIT EXISTS ABOVE THE BEDROCK AT APPROXIMATELY 46-64 FEET BSG. HOWEVER, ONLY TWO RESIDENTIAL WELLS (WELL #13 AND WELL #15) ARE SCREENED IN THIS UNIT. WELL #13 AND WELL #15 ARE LOCATED APPROXIMATELY 0.75 MILES TO THE EAST OF THE SITE AND PRESUMABLY UP GRADIENT. THE REMAINING WELLS OBTAIN GROUNDWATER FROM THE SHALE. WELL #43, LOCATED APPROXIMATELY 1,100 FEET TO THE SOUTHEAST, IS THE NEAREST RESIDENTIAL WELL TO THE SITE, AND IS PRESUMABLY UP GRADIENT. THE LOG FOR WELL #43 DESCRIBES THE UPPER 16 FEET AS SAND FOLLOWED BY CLAY TO THE SURFACE OF THE BEDROCK. THE LOG FOR WELL #43 INDICATES THAT THE WELL OBTAINS WATER FROM THE SHALE.

IN NOVEMBER 1989, TOLEDO TESTING LABORATORY, INC. COMPLETED NINE GEO-TECHNICAL BORINGS IN THE GENERAL VICINITY OF THE HOLDING PIT (APPENDIX F). EACH BORING WAS INSTALLED BY SOLID-STEM AUGER TO A TOTAL DEPTH OF 30 FEET. SPLIT-SPOON SOIL SAMPLES WERE COLLECTED AT AN APPROXIMATE INTERVAL OF FIVE FEET. IN GENERAL THE BORING LOGS INDICATE THAT THE UPPER 0.15 TO 3.5 FEET IS TOPSOIL AND OR CRUSHED STONE, FOLLOWED BY 2 TO 8.5 FEET OF SILTY CLAY FILL. THE NATIVE MATERIALS BENEATH THE FILL DEPOSITS WERE

[1]Ground-Water Resources of Henry County, 1982.J.J. Schmit. ODNR Division of Water (Map)

GENERALLY DESCRIBED AS SOFT TO HARD, SILTY CLAY TO CLAYEY SILT, WITH VARYING AMOUNTS OF SAND AND GRAVEL, WITH OCCASIONAL SILT AND SAND SEAMS BETWEEN 12 AND 23.5 BSG. THE REMAINING NATIVE MATERIALS WERE DESCRIBE AS STIFF TO VERY HARD SILTY CLAY TO CLAYEY SILT, WITH VARYING AMOUNTS OF SAND AND GRAVEL, AND OCCASIONAL SILT AND SAND SEAMS. SILT AND SAND SEAMS PRODUCED WATER IN FOUR OF THE NINE BORINGS. The depth to groundwater at the site was not determined during the previous limited soil investigation.

~~However, publications available through the Ohio State University Extension program indicate that groundwater in Henry County is obtained primarily from a carbonate aquifer located beneath 40 to 85 feet of glacial drift. The City of Napoleon uses surface water obtained from the Maumee River as its public water supply source.~~

Limited zones of transient or perched water were encountered during the remedial investigation along the northern edge of the elevated mound. This water is believed to be transient water that has been trapped above impermeable clays within the mound., ~~, and is not in hydraulic connection with regional groundwater.~~ The bottoms of the water-containing perched units are above the natural grade of the site. The presence of perched water in the non-native site materials suggests that some precipitation is permeating the soil in the study area, and moving within or occupying the more permeable discontinuous layers within the mound. ~~Because the perched water is not in hydraulic connection with groundwater, it~~It is possible that a portion of the water entering the mound sediments exits the mound via seeps along the walls or basal portion of the mound. TO DETERMINE WHETHER THIS WATER IS MIGRATING VERTICALLY TO THE NATURAL GROUNDWATER, THREE MONITORING WELLS WILL BE INSTALLED TO INVESTIGATE SHALLOW GROUNDWATER CONDITIONS AT THE SITE (SEE SECTION 14.1).

4.4 Nature and Extent of Impacts in Soil – December 1999 Investigation

A preliminary investigation was conducted in December 1999 to determine whether soils had been impacted by sludge formerly stored in the former holding pit. The findings were documented in the February 16, 2000, report titled Limited Subsurface Soil Investigation, Former Holding Pit Area.

Twenty-two (22) Geoprobe™ borings were advanced in and around the former pit area. Soil was screened using a photoionization detector (PID) to identify organic vapors in soil under the former holding pit. Samples collected near the bottoms of the borings and at select depth intervals near the former holding pit horizon verified the presence of several specific VOCs. The following compounds were identified above the laboratory method detection limits during the initial investigation:

- acetone
- ethylbenzene
- methyl ethyl ketone (MEK)
- methyl isobutyl ketone (MIBK)
- naphthalene
- total xylenes

Toluene and 1,4-dichlorobenzene were also detected at concentrations below the laboratory method practical quantitation limits (PQLs).

Organic vapors were detected with the PID between about 2 and 9 feet below surface grade (bsg). The highest concentrations of organic vapors were reported from 6 to 9 feet bsg. The approximate horizontal extent of the contaminated area was originally estimated to be approximately 60 by 60 feet. The vertical distribution and the horizontal extent of the contaminated area to the northwest were not fully delineated during this initial investigation.

4.5 Nature and Extent of Impacts in Soil – May 2001~~0~~ Investigation

Additional investigation activities were conducted in May 2001, in accordance with the October 1, 2000, work plan. This investigation was intended to determine the vertical and horizontal extent (to non-detect levels) of VOCs, and to determine whether semi-volatile organic compounds (SVOCs) were present. Personnel from the OEPA Northwest District Office were present during portions of this field work.

Thirty-one (31) Geoprobe™ borings were completed to depths ranging from 8 to 26 feet bsg, at increasing distances from the original sampling grid. Soil samples were collected at 2- to 4-foot depth intervals and field screened for organic vapors using a PID. Select samples from 29 of the borings were submitted to an on-site mobile laboratory for GC/MS analyses of

VOCs and SVOCs using EPA Methods 8260/5035 and 8270, respectively. VOC samples were first preserved using methanol preservation by Method 5035.

THE USE OF METHANOL PRESERVATION INTRODUCED A SIGNIFICANT DILUTION FACTOR, RESULTING IN HIGHER REPORTING LIMITS COMPARED TO METHOD DETECTION LIMITS NORMALLY ASSOCIATED WITH SW-846 METHODS 8260B AND 8270. IT IS IMPORTANT TO NOTE THAT THE LIMITS PRESENTED IN THE LABORATORY DATA SHEETS FOR VOCS ARE REPORTING LIMITS, NOT METHOD DETECTION LIMITS. THE REPORTING LIMITS ARE GREATER THAN THE METHOD DETECTION LIMITS FOR EACH PARAMETER DUE TO THE LABORATORY REPORTING PROCEDURE.

DUE TO THE DIFFERENCE BETWEEN THE REPORTING LIMIT AND THE METHOD DETECTION LIMIT FOR THE VOC SAMPLES, SOIL CONTAMINATION CAN CONCLUSIVELY BE CONFIRMED ONLY WHERE DETECTED ABOVE THE REPORTING LIMITS. THEREFORE, SOILS WITH PARAMETERS ABOVE THE METHOD DETECTION LIMITS BUT BELOW THE REPORTING LIMITS ARE CLASSIFIED AS SUSPECTED CONTAMINATED SOILS.

Summaries of the laboratory findings for VOCs and SVOCs in soil are provided as Tables 1 and 2, respectively. Copies of the laboratory reports for VOCs and SVOCs are provided as Appendices A and B, respectively. Boring logs associated with the May 2001~~0~~ investigation are provided in Appendix C. ALL OF THE VOC VALUES ITALICIZED IN TABLE 1 INDICATE DETECTION OF THE CHEMICAL OF CONCERN ABOVE THE METHOD DETECTION LIMITS BUT BELOW THE REPORTING LIMITS. THE REVISED LABORATORY REPORTS IN APPENDIX A DENOTE THE SUSPECTED CHEMICALS OF CONCERN WITH A LETTER 'J' NEXT TO THE RESULT.

THE FOLLOWING LIST CONTAINS THIRTY-SEVEN (37) CONFIRMED COMPOUNDS FOUND ON-SITE DURING THE MAY 2001 FIELD INVESTIGATION. THEY ARE CONFIRMED COMPOUNDS AS THEY WERE ALL DETECTED IN ONE OR MORE SAMPLES ABOVE THE LABORATORY REPORTING LIMITS. ~~The following thirty-seven (37) Compounds were detected by the on-site laboratory at concentrations above the method detection limits in soil.~~

- chloromethane (methyl chloride)
- bromomethane
- methylene chloride
- chloroform
- benzene
- trichloroethene

- toluene
- ethylbenzene
- total xylenes
- styrene
- isopropylbenzene (cumene)
- 1,2,3-trichloropropane
- n-propylbenzene
- 1,3,5-trimethylbenzene
- tert-butylbenzene
- 1,2,4-trimethylbenzene
- sec-butylbenzene
- p-isopropyltoluene
- n-butylbenzene
- 1,2,4-trichlorobenzene
- naphthalene
- 2-methylnaphthalene
- methyl 4,-2-propanone (MIBK)
- 2-butanone (MEK)
- acenaphthene
- fluorene
- phenanthrene
- anthracene
- fluoranthene
- pyrene
- benzo(a)anthracene
- chrysene
- benzo(b)fluoranthene
- benzo(k)fluoranthene
- benzo(a)pyrene
- indeno(1,2,3-cd)pyrene
- benzo(g,h,i)perylene

THE FOLLOWING SEVENTEEN (17) COMPOUNDS ARE SUSPECTED CONTAMINANTS FOUND ON SITE, PARAMETERS THAT WERE DETECTED IN ONE OR MORE SAMPLES ABOVE THE METHOD DETECTION LIMITS BUT BELOW THE REPORTING LIMITS.

- TRICHLOROFLUOROMENTHANE
- 1,1-DICHLOROETHENE
- TRANS-1,2-DICHLOROETHENE
- 1,1-DICHLOROPROPENE
- 1,2-DICHLOROETHANE
- CHLOROBENZENE
- BROMOBENZENE
- 1,1,2,2-TETRACHLOROETHANE
- 2-CHLOROTOLUENE
- 4-CHLOROTOLUENE
- 1,3-DICHLOROBENZENE
- 1,4-DICHLOROBENZENE
- 1,2-DICHLOROBENZENE
- 1,2-DIBROMO-3-CHLOROPROPANE
- HEXACHLOROBUTADIENE
- 1,2,3-TRICHLOROBENZENE
- ACETONE

The investigation identified overlapping areas of soil impact: one comprised predominantly of VOCs with few SVOCs, and the other SVOCs with fewer VOCs. The VOC area is slightly smaller and deeper than the SVOC area and covers an area approximately 110 feet by 70 feet. The SVOC affected area is larger, 160 feet by 85 feet, and contains the entire VOC affected area. Depths of contaminants vary across the site, with VOCs ranging from approximately 4 to 16 feet and SVOC ranging from 4 to 9 feet bsg.

Estimates of the extent of soil contamination are presented in plan view on Figures 3 (A and B) and in cross section on Figures 4A through 4C. VOCs and SVOCs were generally found within

the more permeable layers of cinders and ash that were spread across the site at various horizons within the mounded area.

The SVOCs are not associated with the sludge that was stored in the former holding pit. Cinders and spent ash from the on-site boiler house have been disposed in this area for many years. It is likely that the SVOCs identified at the site have leached from these cinders. In addition, kerosene or other petroleum products may have been released into the soil during plant fire brigade training.

4.6 Nature and Extent of Impacts in Groundwater

~~The deepest extent of soil contamination is above the base of the mound, and higher than the natural ground surface. There is no possibility for the soil contamination to leach to the natural groundwater system. Therefore no groundwater is impacted beneath this unit.~~

THE IMPACT OF THE SOIL CONTAMINATION ON THE GROUNDWATER HAS NOT BEEN EVALUATED. A GROUNDWATER SAMPLING PLAN HAS BEEN DEVELOPED TO DETERMINE THE NATURE AND EXTENT OF THE IMPACT ON SHALLOW GROUND WATER IN THE VICINITY OF THE FORMER HOLDING PIT. THE GROUNDWATER SAMPLING PLAN IS INCLUDED IN SECTION 14.1 "SAMPLING PLAN TO DETERMINE IMPACTS TO SHALLOW GROUNDWATER" OF THIS CLOSURE PLAN.

~~However,~~ Perched transient water was identified in five of the 37 borings advanced in May 2001. The five borings containing water were all in the northwestern portion of the mound, and within a tightly limited area, presumably within the same small lens or pocket of saturated material. The deepest saturated materials in the study area are ~~well~~ IN THE ELEVATED FILL AREA AND above the ~~clay-rich~~ natural ground surface. ~~Therefore, this perched water cannot be in hydraulic connection with natural groundwater and does not pose a future risk to groundwater.~~

Samples of the perched water were collected from all five water containing boring locations at depths of 11 to 16 feet. Samples were obtained via 1-inch diameter PVC Geoprobe™ wells with 5-foot screens, using a peristaltic pump. New tubing was used for the collection of each sample. Water samples were collected from borings PB-01-33, PB-01-34, PB-01-35, PB-01-45, and PB-01-46. EACH SAMPLE WAS PLACED INTO 40 ml. septum-capped bottles and submitted to

the on-site laboratories for VOC and SVOC analyses using EPA Methods 8260 and 8270, respectively.

Water samples collected from all five borings indicated low but detectable levels of organic contaminants, generally the relatively soluble VOCs and the SVOCs naphthalene, and 2-methylnaphthalene. The compounds detected in perched water samples include the following:

- benzene
- toluene
- ethylbenzene
- total xylenes
- styrene
- isopropylbenzene (cumene)
- n-propylbenzene
- 1,3,5-trimethylbenzene
- tert-butylbenzene
- 1,2,4-trimethylbenzene
- sec-butylbenzene
- p-isopropyltoluene
- n-butylbenzene
- naphthalene
- 2-methylnaphthalene
- methyl 4,-2-propanone (MIBK)

4.7 Site Conceptual Model

The area of concern is an artificially constructed and elevated mound approximately ~~25~~ 20 feet above natural grade, and several hundred feet in diameter. This mound has gradually risen above the natural grade as fill soil, cinders, brush, and other materials have been deposited here. Due to the non-native lithology, the artificial process of deposition, and mechanical reworking, the distribution of the materials within the mound is unpredictable and subject to dramatic changes over short distances.

The mound can be visualized as numerous laterally discontinuous layers of alternating impermeable clay (representing local fill from construction or grading activities) and permeable cinders from the boiler house. Precipitation that infiltrates vertically through the surficial clay layers may enter, occupy, or migrate through the thin permeable layers of cinders that have been deposited and spread throughout the mound at various times.

This may result in perched groundwater in isolated pockets of cinders in various portions of the mound. ~~This perched water is not in contact with native groundwater, as the bottoms of the perched layers are at higher elevations than the native ground surface.~~ Where the

cinder layers intersect the outer slope of the mound, there is the potential for ex-flow and seeping of transient water from these perched zones.

The former holding pit was excavated into one of the clay-rich soil layers at a time when the mound was approximately 4 feet lower than at present. The former holding pit was used for approximately 2 years to temporarily hold semi-solid wastes prior to off-site disposal. Sand was mixed with the sludge to decrease the moisture content prior to transportation to the permanent disposal site. When the pit was abandoned, the contents and clay dikes and liner were removed, and the pit sidewalls were pushed into the pit bottom. The area was re-graded and approximately four feet of fill was eventually deposited over the former pit area. Some of the mixing sand may have been regraded into the fill, possibly producing thin and isolated soil layers with higher relative permeability. The manner in which the berms were graded and spread over the site has lead to a much larger foot-print of contamination than would be expected.

Based on conversations with plant personnel and the soil profile observed during the previous limited soil investigation, the area formerly occupied by the holding pit has the following general lithologic profile:

- From 0 to 4 feet below grade – more recent fill material consisting of clay, cinder, and construction debris.
- From 4 feet to 6 feet below grade – mixed materials consisting of the former collapsed pit berms and sand used for mixing.
- From 6 feet to about ~~25~~ 20 feet below grade - older (pre-holding pit) fill material consisting of clay with some sand or silt and some cinders.
- From about ~~25~~ 20 feet to at least ~~35~~ 30 feet below grade – paleosol with native clay and VARIABLE fine textured sediments

Contaminant concentrations are highest within the horizon associated with the bottom of the former clay pit, or at 4 to 6 feet below the current ground surface. Where the mound is higher, or where leaching may have occurred, contaminants are found at deeper depths, generally in cinder layers. Concentrations GENERALLY decrease with depth, DROPPING TO NON-DETECT OR VERY LOW CONCENTRATIONS, ~~generally to non-detect levels,~~ between 9 and

16 feet bsg, depending on location. The underlying clay-rich native soil is expected to act as a low permeability barrier to continued vertical migration.

A schematic cross sectional conceptual model representation of the former holding pit is provided as Figure 5. From this model, it is apparent that the potential exposure routes are limited. ~~There is not pathway for contaminants to enter groundwater, and groundwater is not used within a mile of the site.~~ No subsurface structures or basements are in the mound, eliminating the indoor air volatilization pathway. The cover material prohibits direct contact with the contaminated soil. There is a potential pathway for direct contact or ecological receptors being affected by seeps that may discharge from limited locations around the mound~~—however, the presence of contaminants in any seep water has not been confirmed~~. A PLAN FOR SAMPLING THE SEEPS IS PRESENTED IN SECTION 14.2.

4.8 Local Occurrence of Groundwater

Groundwater was not encountered in any boring completed in the preliminary (December 1999) soil investigation. Borings were advanced to a depth of 12 feet below grade with no observed soil saturation. Any moisture observed in soils was attributed to transient water, as the borings were generally too shallow to extend below the natural grade. Perched water was encountered in five borings during the May 2001~~0~~ investigation.~~, but this was determined not to be in connection with groundwater. OEPA personnel on-site during the investigation activities concurred with this determination.~~

~~There are no deep wells near the study area. Thus information related to the natural groundwater under the facility is directly observable.~~ According to the Henry County Health Department, few water users obtain water from groundwater resources in the Napoleon area. Groundwater is not generally available in the unconsolidated clay-rich sediments found above bedrock in this part of the County. Some private wells may be present beyond the limits of the Napoleon water supply distribution system, but these generally obtain water from the deeper carbonate bedrock aquifers in the area. The water quality and quantity is extremely variable in these wells. Most public and industrial water supply systems obtain surface water from the Maumee River.

The potential for groundwater impact at this site is ~~extremely~~ low, due to the limited penetration depth of infiltrating chemicals. Perched water observed in several borings on the north portion of the study area is located in fill materials that are above the natural grade, and the natural clay soils. ~~There is no potential for this water to be in hydraulic connection with natural groundwater. The vertical extent of contamination is limited to soil above natural grade; therefore, groundwater cannot be affected and groundwater is not an exposure pathway for this investigation~~

4.9 ~~Vertical and Horizontal Extent~~Occurrence of VOCs in the Area of Impact

The preliminary and follow-up investigations at this site have shown that the area of impact may be 4 times larger than originally expected, based on the size of the original holding pit area. The horizontal and vertical extent of ~~organic compounds~~VOCs was delineated to ~~non-detect~~THE SITE-SPECIFIC MULTIPLE CHEMICAL ADJUSTED DIRECT CONTACT CLOSURE VALUES (SEE SECTION 13) ~~concentrations~~ across the site. Based on OEPA provided site-specific ~~multiple chemical adjusted direct contact~~ closure values ~~(see Section 13)~~, the area of VOC impact requiring remediation is roughly 110 feet by 70 feet, and is generally from 8 to 16 feet deep. The vertical and horizontal extent of VOC contamination above these criteria is shown on Figures 3A-3B and the vertical extent is also evident in the cross-sections (Figures 4A through 4C). TO DATE THE VOC DELINEATION HAS BEEN COMPLETED TO THE REPORTING LIMITS OF THE ON-SITE MOBILE LABORATORY. THESE REPORTING LIMITS ARE HIGHER THAN THE METHOD DETECTION LIMITS. WHEN COMPARED TO METHOD DETECTION LIMITS THE DELINEATION IS UNCERTAIN, REQUIRING ADDITIONAL INVESTIGATION. A SAMPLING PLAN IS PROVIDED IN SECTION 14.7 TO ACHIEVE THIS GOAL.

4.10 Occurrence of SVOCs in the Area of Impact

Following the preliminary investigation, the Ohio EPA requested that the soil under the former holding pit be evaluated for SVOCs based on the detection of naphthalene. The follow-up investigation confirmed that naphthalene and other SVOCs were present in the soil under the former holding pit, and in other parts of the mound. The area of SVOC impact is larger than that for VOCs, covering an area approximately 160 feet by 85 feet, and completely overlapping the VOC area of impact. The vertical extent of SVOC impact generally is limited to 9 feet or less across the investigation area. The SVOCs are more prevalent in the south-southwest portion of the site, and may be related to sources other

than the former holding pit, including the cinders and ash from the boiler house and petroleum fuels used during firefighter training drills. THE HORIZONTAL AND VERTICAL EXTENT OF THE SVOC CONTAMINATION WAS DELINEATED TO NON-DETECT CONCENTRATIONS ACROSS THE SITE (FIGURES 3A AND 3B).

5.0 DETAILED DRAWING OF UNIT TO BE CLOSED

Figure 4A presents the estimated location of the former holding pit. This location is based on the recollection of facility personnel involved with operation or decommissioning of the holding pit. Ground surface contours are also presented on this figure.

Contaminants from sources other than spent coating materials and solvents appear to have impacted the soils beyond the former holding pit location. The SVOCs identified in soils may originate from cinder and ash material from the boiler house, or from petroleum product used on-site. Site personnel indicate that this area was used to train the facility fire brigade in extinguishing chemical fires. While an effort was made to contain the accelerants used to fuel the training fires, kerosene or some other petroleum product may have been released to the environment. Chemicals associated with petroleum product releases are considered non-hazardous under RCRA, unless hazardous by characteristic.

5.1 Maximum Volume of Hazardous Waste

Based on the original dimensions of the holding pits (35 feet long x 20 feet wide x 2.5 feet high), the maximum volume of sludge that may have been present at any one time is estimated to be 1,400 cubic feet, assuming the sludge never exceeded a depth of 2 feet. This volume estimate is considered conservative, as the calculation assumes that the pits were filled to capacity and that the berm sidewalls were vertical. The actual maximum volume of material stored in the holdings pits may have been less.

The volume of soil that has been impacted above site-specific direct contact cleanup values is estimated to be 3,300 CUBIC YARDS. ~~between 2,000 and 3,000 cubic yards.~~ This does not include approximately 4 feet (~~2,000~~2,400 cubic yards) of relatively unaffected overburden that has been deposited over the former holding pit.

6.0 LIST OF HAZARDOUS WASTES

6.1 Chemicals of Concern

The materials stored in the former holding pit generally were associated with wastes recovered from the enamel coating process for the inside of food containers. According to the Material Safety Data Sheets (MSDS) provided for these enamels (copies submitted to OEPA on April 20, 2000), the chemical constituents that may have been present in the waste materials stored in the holding pit include the following:

- Alcohols - n-butanol
- Ethers - diethyl glycol monobutyl ether, ethylene glycol monobutyl ether, glycol ether, and propylene glycol methyl ether
- Ketones – cyclohexanone, 2-butanone (MEK), methyl isobutyl ketone (MIBK)
- Formaldehyde
- Xylenes

THE OHIO EPA HAS ASSIGNED THE WASTE CODE D001 TO THIS SITE DUE TO THE ORIGINAL WASTES TEMPORARILY STORED IN THE HOLDING PIT. Chemicals that were actually detected in soils under the former holding pit during the limited preliminary and follow-up soil investigation include the following:

- chloromethane (methyl chloride)
- bromomethane
- methylene chloride
- chloroform
- benzene
- trichloroethene
- toluene
- ethylbenzene
- total xylenes
- styrene
- isopropylbenzene (cumene)
- 1,2,3-trichloropropane
- n-propylbenzene
- 1,3,5-trimethylbenzene
- tert-butylbenzene
- 1,2,4-trimethylbenzene
- sec-butylbenzene
- p-isopropyltoluene
- n-butylbenzene
- 1,2,4-trichlorobenzene
- naphthalene
- 2-methylnaphthalene
- methyl 4,-2-propanone (MIBK)
- 2-Butanone (MEK)
- acenaphthene
- fluorene
- phenanthrene
- anthracene
- fluoranthene
- pyrene
- benzo(a)anthracene
- chrysene
- benzo(b)fluoranthene
- benzo(k)fluoranthene
- benzo(a)pyrene
- indeno(1,2,3-cd)pyrene
- BENZO(G,H,I)PERYLENE
- 1,4-Dichlorobenzene (at concentrations below the practical quantification limit

6.2 Suspected Chemicals of Concern

Field preservation of the soil samples prior to VOC analysis introduced significant matrix interference, resulting in elevated reporting limits. The following seventeen (17) compounds are suspected contaminants found on site. These are parameters that were detected in one or more samples above the method detection limits but below the reporting limits.

- Trichlorofluoromenthane
- 1,1-Dichloroethene
- Trans-1,2-Dichloroethene
- 1,1-Dichloropropene
- 1,2-Dichloroethane
- Chlorobenzene
- Bromobenzene
- 1,1,2,2-Tetrachloroethane
- Acetone
- 2-Chlorotoluene
- 4-Chlorotoluene
- 1,3-Dichlorobenzene
- 1,4-Dichlorobenzene
- 1,2-Dichlorobenzene
- 1,2-Dibromo-3-Chloropropane
- Hexachlorobutadiene
- 1,2,3-Trichlorobenzene

It should be noted that all of the suspected chemicals of concern were detected at very low concentrations (ranging from 6 ppb to 160 ppb), with the exception of acetone (108 ppb to 840 ppb).

The lab reports were re-issued to report all detectable concentrations above the method detection limits. The mobile laboratory contractor, New Age Landmark, Inc., noted that the reason for setting the reporting limits above the method detection limits was to avoid false positive readings from compounds "hanging up" in the lab equipment. New Age Landmark notes that low concentrations of acetone, MEK, methylene chloride, and TCE can be attributed to lab error. A copy of the New Age Landmark correspondence is included in the beginning of Appendix A.

7.0 REMOVAL OF HAZARDOUS WASTES AND SOIL REMEDIATION

All hazardous wastes stored in the former holding pit were removed from the site in 1983. The residual soil contamination revealed in the investigations is the focus of the cleanup effort at this site.

Many options were evaluated for addressing the residual contaminants in the soil and transient perched water. General remedial approaches considered for this site are summarized and presented in Appendix D. Of these, three options – on-site land farming, on-site medium-temperature thermal desorption, and off-site disposal at a hazardous waste facility – were considered most feasible.

Based on the site conditions, the available facilities at the plant, the relative cost of each option, the efficacy of each option, and future liabilities associated with each option, Campbell Soup Company has elected to remediate the former holding pit site by excavating the impacted soil and treating it on site using medium-temperature thermal desorption (MTTD). This approach offers the following advantages:

- Long-term liabilities associated with the contaminated soil will be reduced or eliminated.
- Long term monitoring requirements and/or permits will not be required .
- The approach focuses on destruction of the contaminants, rather than long-term containment or transfer to other media.
- The relative cost of implementation is less than the other approaches available for handling the proposed volumes of soil.
- Sufficient land and support facilities are available for an on-site MTTD operation.
- The MTTD approach provides the best protection against unknown future impacts to ecological systems or environmental pathways.

SOILS WILL BE CHARACTERIZED PRIOR TO INITIATING CLEANUP TO VERIFY THEY ARE NON-HAZARDOUS. THE CHARACTERIZATION PROCESS IS DESCRIBED IN SECTION 14.4. AFTER VERIFICATION OF NON-HAZARDOUS SOIL CONDITIONS, ~~T~~the soil will be excavated in three to

four stages. In the first stage soil will be removed from the ground surface (about 686 to 689 feet above mean sea level (MSL)) to an elevation of 680 feet MSL. The second stage will remove impacted soils between 680 and 675 feet MSL. The third stage will remove soils between 675 and 670 feet (Figures 3A and 3B). If necessary, a fourth stage (below 670 feet MSL, Figure 3B) will be excavated to remove soil that does not satisfy the confirmation sampling goals for site cleanup and closure certification.

Prior to initiating excavation, the area targeted for remediation, based on the analytical results from the December 1999 and May 2001~~0~~ soil investigations, will be surveyed and marked off at the ground surface to serve as a guide for excavators. Because the upper several feet of overburden is not impacted and does not require treatment, the first excavation stage soils will be screened for impact. These soils will be removed from the marked-off area in one-foot lifts and transported to a temporary soil screening and staging area to determine whether treatment is required. Soils will be screened using a PID and placed into one of three areas: "suspected clean" (PID = 0 to 10 ppm), "contaminated" (PID > 100ppm), and "indeterminate" (PID = 10 ppm to 100 ppm).

Soil identified as contaminated will be moved to the pre-remediation staging area for immediate treatment. Indeterminate soils will be reevaluated in smaller sub-units and either confirmed clean or treated. Suspected clean soils will be sampled at a frequency of one sample per 100 cubic yards and analyzed for VOCs and SVOCs. Soils shown to be below the designated cleanup criteria will ultimately be returned to the excavation as backfill.

Excavation and removal of the un-impacted overburden will continue progressing deeper in one-foot lifts until contamination is encountered. Excavation will then progress in five foot lifts until the elevation of ~~685~~ 680 feet ABOVE MSL is obtained. IT IS ESTIMATED THAT 4,300 CUBIC YARDS OF SOIL WILL BE REMOVED DURING THE FIRST STAGE OF EXCAVATION. OF THE SOIL REMOVED DURING THE FIRST PHASE OF EXCAVATION IT IS ESTIMATED THAT APPROXIMATELY 1,900 CUBIC YARDS WILL BE TRANSPORTED TO THE MTTD FOR TREATMENT.

All soils within the areas delineated for the second and third stages of excavation will be considered impacted, and immediately transported to the MTTD soil treatment staging area.

IT IS ESTIMATED THAT 1,250 CUBIC YARDS OF CONTAMINATED SOIL WILL BE REMOVED AND TREATED DURING THE SECOND STAGE OF EXCAVATION AND 150 CUBIC YARDS OF CONTAMINATED SOIL WILL BE REMOVED AND TREATED DURING THE THIRD STAGE OF EXCAVATION.

Prior to conducting excavation in areas where transient perched water is present, the existing 1-inch diameter Geoprobe™ wells and additional dewatering points will be used to extract and dewater the saturated permeable sediments as feasible. The excavation will then be advanced in such a manner as to create a sump sufficient to collect any remaining liquid for removal to a vacuum truck. This water will be disposed at the on-site wastewater treatment plant (WWTP)~~., or if necessary, at a licensed liquid hazardous waste disposal facility. If off-site transportation of liquid wastes is necessary, proper DOT waste manifests will be generated and submitted to the OEPA.~~

Soils slated for treatment will be loaded onto the conveyors to the MTTD. Cohesive soils are passed through grinders and shredders that reduce the soil clumps to 2-inches in diameter or less. Soils enter the rotating kiln and are subjected to ~~8~~550 deg. F. temperatures, sufficient to desorb all organic VOCs and SVOCs. Treated soils are quenched with water and cooled to 212 deg. F. before exiting the reactor. Treated soils will be sampled IN ACCORDANCE WITH SECTION 14.5. ~~at a frequency of 1 sample per 500 tons to verify cleanup goals have been met.~~ Treated and tested soil will be returned to the excavation as clean backfill.

Off-gasses from the treatment reactor are passed through a bag-house to recover fine particulates, and then passed though a high temperature (1600 to 1750 deg. F.) afterburner and oxidizer to prevent discharge of contaminants to the air. ~~Emissions are regulated in accordance with an air quality permit~~

The MTTD reactor and excavation equipment will be provided by M. L. Chartier, Inc., Environmental Services, located at 9195 Marine City Highway, Fair Haven, Michigan. PER THE MANUFACTURERS RECOMMENDATION, WE DO NOT PLAN TO RUN A BENCH SCALE TRIAL OR A TEST BURN FOR TREATING THE CONTAMINATED SOILS ON-SITE WITH THE MTTD.

7.1 Equipment and protocol

The excavation and soil treatment protocol is described above in Section 7.0. Implementation of the remedial action described above will require the materials and equipment summarized in the list below. This is not a comprehensive list of all materials and equipment that will be required, and is subject to change and modification:

- Medium-temperature thermal desorption reactor and associated control centers, support machinery and conveyors.
- Heavy earth-moving equipment, including excavators and front-end loaders for excavating soil and depositing it to soil segregation and treatment staging areas, and returning treated soil to the excavation.
- Visqueen plastic sheeting for temporary storage and covering of soil in the pre-treatment segregation and staging areas and containment in decontamination zones.
- Photoionization detectors and laboratory sample jars to screen soils and confirm screening results for segregating soil and for evaluating remediation effectiveness.
- Vacuum truck for collecting and transporting a limited volume of perched transient water to the on-site WWTP~~, or a hazardous waste facility, depending upon analytical characteristics.~~
- Clean DOT approved 55-gallon drums, water tanks, sprayers, and plastic sheeting to facilitate decontamination of personal equipment and sampling tools.
- High-pressure steam washing equipment and suitable rinseate collection equipment to facilitate decontamination of large earth-moving equipment and trucks.
- Natural gas, water, and electricity connections to support MTTD operations.

8.0 SCHEDULE FOR CLOSURE

The proposed schedule for completing the unit closure and conducting residual soil remediation is presented below: The OEPA will be notified at least five days in advance of the activities indicated. A Professional Engineer licensed in the state of Ohio will be present for the activities indicated. A representative of the engineer may substitute for the engineer during portions of selected activities, as indicated by the asterisk.

Activity	Days after OEPA Closure Plan Approval	Notification to OEPA	PE On-Site
Complete Site Health & Safety Plan	30	No	No
TCLP ANALYSIS	30	NO	NO
INSTALL MONITORING WELLS AND ADDITIONAL SITE DELINEATION SAMPLES	60	YES	NO
Obtain quotations from contractors and schedule site closure activities	~~75~~80	No	No
Survey site and conduct pre-closure briefings with contractors and OEPA	~~120~~130	Yes	Yes*
Initiate soil excavation and soil treatment	~~135~~140	Yes	Yes*
VERIFY INITIAL ELEVATION OF SOIL CONTAMINATION	145	YES	YES
Complete excavation and soil treatment And collect closure verification samples	~~150~~170	No	Yes*
Receive results of closure verification Sampling	~~165~~185	Yes	No
Conduct engineer inspection and certification of site closure*	~~180~~195	Yes	Yes
Complete excavation backfill and re-grading	~~195~~210	Yes	No

*A CERTIFICATION REPORT WILL BE SUBMITTED TO THE OHIO EPA WITHIN 60 DAYS OF COMPLETION OF FIELD WORK.

9.0 OTHER PERMITS

9.1 Air Emissions and Wastewater

~~The Air Quality Division of the OEPA will be contacted prior to implementing remedial action to determine the requirements for discharging air emissions from the MTTD unit.~~ Emissions from the MTTD are passed through a high-temperature afterburner and oxidized prior to discharge~~, and air quality issues with the discharge should not be an issue~~. THE MAXIMUM EXPECTED EMISSIONS OF ORGANICS FROM THE AFTERBURNER IS LESS THAN 15 LBS/DAY. THIS ESTIMATE IS BASED ON THE FOLLOWING:

- A CONSERVATIVE 98% DESTRUCTION RATE OF VOLATILE ORGANIC COMPOUNDS IN THE AFTERBURNER,
- TREATMENT OF 500 TONS OF SOIL PER DAY, AND
- THE AVERAGE CONCENTRATION OF ORGANIC COMPOUNDS IN THE SOIL, BASED ON THE MAY 2001 FIELD WORK.

DUE TO THE MAXIMUM AMOUNT OF ORGANIC EMISSIONS, INSTALLATION OF THE MTTD IS EXEMPT FROM OBTAINING AN AIR PERMIT PER THE OHIO ADMINISTRATIVE CODE 3745-31-03 (4) (D).

DURING IMPLEMENTATION OF THE EXCAVATION OF THE REMEDIAL ACTION, SOME WASTEWATER WILL BE GENERATED AS TRANSIENT PERCHED WATER IS EXTRACTED FROM THE NORTHWEST PORTION OF THE CLEANUP AREA. CAMPBELL'S ON-SITE WWTP CAN HANDLE THE CONCENTRATIONS OF ORGANICS IN THE PERCHED WATER PER THE ANALYTICAL DATA COLLECTED DURING THE MAY 2001 FIELD INVESTIGATION. THEREFORE, THE PERCHED WATER WILL BE LOADED INTO A VACUUM TRUCK AND TRANSPORTED TO THE ON-SITE WWTP FOR DISPOSAL.

DURING THE UPCOMING REMEDIATION FIELDWORK ADDITIONAL WASTEWATER WILL BE GENERATED AS SURFACE WATER COMES INTO CONTACT WITH THE CONTAMINATED SOILS AND AS RINSEATE WATER IS GENERATED FROM DECONTAMINATION PROCESSES. WE ANTICIPATE THAT THE PERCHED WATER WILL HAVE THE HIGHEST CONCENTRATIONS OF ORGANICS, DUE TO ITS CONTINUOUS CONTACT WITH THE CONTAMINATED SOILS. THEREFORE, THE ON-SITE WWTP WILL BE ABLE TO ACCEPT THE SURFACE WATER AND RINSEATE WATER GENERATED DURING THE FIELDWORK AND NO PRETREATMENT ANALYSIS ARE NECESSARY.

~~During implementation of the excavation of the remedial action, some wastewater will be generated as transient perched water is extracted from the northern portion of the cleanup area. All water generated will be loaded into a vacuum truck and, if appropriate, transported to the on-site WWTP for disposal. If analytical data shows that the liquid is considered hazardous, the water will be transported under proper DOT procedures and waste transportation manifest documentation to a licensed hazardous liquid waste facility.~~

~~Some wastewater will also be generated during decontamination procedures. This water will be disposed at the on site WWTP, unless shown to be hazardous.~~

10.0 PERSONNEL HEALTH AND SAFETY

Prior to initiating field activities, a Site Health & Safety Plan will be prepared in accordance with OSHA, 29 CFR 1910.120. The Site Health & Safety plan will be provided to any subcontractor involved in the on-site implementation of this work plan. An on-site meeting will be held with contractors prior to initiating field activities to ensure they understand the potential hazards associated with the implementation of this work plan.

The Health & Safety plan document will include the following information:

- key personnel and responsibilities
- training and medical surveillance requirements
- site description
- work objectives
- hazard evaluation
- air monitoring
- personal protective equipment
- decontamination and site control procedures
- residuals management
- emergency information and contacts
- contingency plan for emergencies
- spill containment procedures, and
- confined space entry procedures

11.0 DECONTAMINATION EFFORTS

11.1 Decontamination of Equipment and Tools

All hand tools used to move, sample, or otherwise handle potentially contaminated soil will be decontaminated prior to leaving the restricted zone. Smaller tools and equipment will be washed with a Liquinox solution and rinsed using a triple-rinse protocol. Larger tools and heavy equipment will be decontaminated using a steam cleaner prior to exiting the site exclusion zone. All decontamination will take place over Visqueen plastic sheeting, or another suitably impermeable surface. Wastewater associated with the decontamination processes will be collected and disposed in the influent header of the on-site WWTP. It is expected that 500 to 1000 gallons of decontamination liquids will be generated and disposed at the on-site WWTP facility.

11.2 CROSS CONTAMINATION MANAGEMENT

STANDARD CROSS-CONTAMINATION ABATEMENT MEASURES WILL BE TAKEN TO ENSURE THE CONTAMINANTS IN THE SOIL WILL NOT BE TRANSFERRED TO ANOTHER MEDIA DURING RAINFALL EVENTS. RAINWATER THAT COMES INTO CONTACT WITH THE CONTAMINATED SOIL WILL BE DIVERTED TO A COLLECTION SUMP AREA, LINED WITH VISQUEEN PLASTIC SHEETING. ANY RAINWATER THAT COLLECTS IN THE SUMP AREA WILL BE PUMPED TO A TEMPORARY HOLDING TANK, AND ULTIMATELY DISPOSED OF AT THE ON-SITE WWTP. EQUIPMENT WILL BE CLEANED OF POTENTIALLY CONTAMINATED SOIL PRIOR TO LEAVING THE EXCAVATION AND TREATMENT AREAS.

12.0 CLOSURE STRATEGY / REMEDIATION STANDARDS FOR SOIL (INCLUDING GROUND WATER)

12.1 Naturally Occurring Compounds

There are no chemicals of concern at this site that are naturally occurring. All closure criteria are risk-based cleanup values determined as described below.

12.2 Compounds Not Naturally Occurring

Thirty-seven chemicals of concern have been identified above laboratory ~~method detection~~REPORTING limits at this site. All compounds are either VOCs or SVOCs. Because there are multiple chemicals of concern in a number of soil borings and soil samples, the Single Chemical Generic Cleanup Numbers (Table 1 of Appendix D, Closure Plan Review Guidance for RCRA Facilities, Part II, OEPA, March 1999) cannot be used as cleanup criteria. ADDITIONALLY, SEVENTEEN SUSPECTED VOCS OF CONCERN WERE DETECTED BELOW THE LABORATORY REPORTING LIMIT.

Risk assessors at the OEPA assisted Campbell Soup Company with development of site-specific risk-based cleanup standards, adjusted for multiple chemicals. The general strategy for meeting the cleanup numbers at this site involves removal through excavation and on-site treatment using medium-temperature thermal desorption. Treated soil will be returned to the excavation once it is demonstrated that cleanup criteria are met by the treatment process.

13.0 RISK-BASED REMEDIATION STANDARDS

~~There is no contact or potential contact of chemicals of concern with naturally occurring groundwater; therefore, all groundwater related exposure pathways are considered closed.~~ There is no potential for volatilization of chemicals of concern to impact indoor or ambient air quality; therefore exposure pathways based on volatilization are not applicable. The site specific risk-based cleanup numbers for this site are based on the direct contact exposure pathway. THE POTENTIAL FOR RISK ASSOCIATED WITH DIRECT CONTACT WITH GROUNDWATER WILL BE INVESTIGATED FURTHER DURING ADDITIONAL SITE INVESTIGATION ACTIVITIES (SEE SECTION 14.1).

Risk-based residential direct contact cleanup numbers adjusted for multiple chemicals, as provided by OEPA risk assessors on ~~October 17, 2001~~MAY 20, 2002, will be used as the basis of this site closure. These cleanup numbers are summarized in Table 3.

While ecological and environmental exposures have not been identified and are not expected, there is limited potential for impacts to a small drainage ditch located north of the mound on which the former holding pit was located. The ditch ultimately empties to the Maumee River after passing through the plant facility and under an elevated cooling water/steam condensate pipeline bridge. The ditch passes within 150 to 200 feet of the unit, approximately 30 to 50 beyond the north end of the base of the mound. This ditch may contain aquatic insects, invertebrates, and/or small vertebrates. The ditch will be sampled AS OUTLINED IN SECTION 14.2. ~~to determine whether seeps from the side of the mound have discharged to the ditch, affecting water quality in the ditch. Samples will be collected at the nearest point to the unit, at a location 100 yards up stream from this point, and at a location 100 yards down stream from this point, and analyzed for the chemicals of concern.~~

14.0 SAMPLING PLAN AND ANALYTICAL PROCEDURES

SAMPLING PLANS AND ANALYTICAL PROCEDURES HAVE BEEN DEVELOPED FOR EIGHT SEPARATE ACTIVITIES INCLUDED IN THIS CLOSURE PLAN. THE FIRST THREE SAMPLING PLANS, DESCRIBED IN SECTIONS 14.1 THROUGH 14.3, IDENTIFY THE PROCEDURES FOR WATER SAMPLING AND ANALYSIS. SAMPLING PLANS FOR SOIL CHARACTERIZATION ARE OUTLINED IN SECTIONS 14.4 THROUGH 14.6. THE SEVENTH SAMPLING PLAN (SECTION 14.7) DESCRIBES THE SITE DELINEATION SAMPLING PLAN. THE LAST SUBSECTION, SECTION 14.8, IS THE SAMPLING HANDLING AND ANALYSIS PLAN FOR ALL PORTIONS OF THE FIELD WORK.

14.1 SAMPLING PLAN TO DETERMINE IMPACTS TO SHALLOW GROUNDWATER

TO ADEQUATELY CHARACTERIZE ANY EFFECTS TO SHALLOW GROUNDWATER IN THE NATURAL UNCONSOLIDATED ZONE, THREE MONITORING WELLS WILL BE INSTALLED IN THE FIRST ENCOUNTERED SATURATED ZONE. THREE LOCATIONS AT THE EDGE OF THE ELEVATED AREA, AS DEPICTED IN FIGURE 6, HAVE BEEN SELECTED FOR THE INSTALLATION OF THE THREE SHALLOW MONITORING WELLS. THE LOCATIONS WERE SELECTED BASED ON THEIR PROXIMITY TO KNOWN PERCHED WATER LAYERS IN THE ELEVATED AREA. ACTUAL WELL LOCATIONS WILL BE SELECTED BASED ON INPUT FROM ON-SITE OEPA REPRESENTATIVES.

EACH WELL WILL BE INSTALLED IN SOIL BORINGS DRILLED USING HOLLOW STEM AUGER DRILLING TECHNIQUES, OR AN EQUIVALENT TECHNIQUE. CONTINUOUS SPLIT-SPOON SAMPLES WILL BE COLLECTED DURING THE INSTALLATION OF THE SOIL BORINGS. A PHOTOIONIZATION DETECTOR (PID) WILL BE USED TO CONDUCT FIELD SCREENING OF EACH SOIL SAMPLE AT TWO-FOOT INTERVALS. UNUSUAL VISUAL OR OLFACTORY OBSERVATIONS WILL BE SCREENED SEPARATELY. IF PID READINGS INDICATE ORGANIC VAPORS ARE PRESENT IN THE SOIL A SOIL SAMPLE WILL BE COLLECTED FROM THE INTERVAL WITH THE HIGHEST PID READING. OTHERWISE, TWO SOIL SAMPLES WILL BE COLLECTED, ONE FROM THE UPPER THREE FEET AND ONE FROM BOTTOM OF THE BORING. IF WATER IS ENCOUNTERED, A WATER SAMPLE WILL BE COLLECTED IN PLACE OF THE BOTTOM SOIL SAMPLE. COLLECTED SAMPLES WILL BE SUBMITTED TO A FIXED LABORATORY FOR ANALYSIS OF VOCS AND SVOCS PER US EPA SW-846 METHODS.

SOIL BORINGS WILL BE TERMINATED AT THE FIRST AVAILABLE WATER OR AT 20 FEET BELOW NATURAL GRADE, WHICHEVER IS ENCOUNTERED FIRST. THE SURFACE OF THE NATURAL GRADE WILL BE DETERMINED BY VISUAL INSPECTION OF THE SOIL SAMPLES TO POSITIVELY IDENTIFY THE NATIVE SOIL HORIZON BENEATH THE SITE. THE SOIL BORING WILL ADVANCE 20-FEET BELOW THE FIELD VERIFIED SOIL HORIZON OR TO APPROXIMATELY 650 FEET ABOVE MSL (BASED THE ESTIMATED NATURAL GRADE ELEVATION OF 670 ABOVE MSL, ESTIMATED FROM HISTORICAL TOPOGRAPHIC MAPS (APPENDIX G)).

MONITORING WELLS WILL BE INSTALLED IN EACH BORING REGARDLESS OF THE QUANTITY OF WATER OBSERVED DURING COMPLETION OF THE BORING. THE WELL SCREEN WILL BE PLACED AT THE SHALLOWEST INTERVAL THAT IS MOST LIKELY TO PRODUCE GROUNDWATER. EACH WELL WILL BE CONSTRUCTED OF 2-INCH DIAMETER SCHEDULE-40 PVC CASING WITH 2-INCH DIAMETER SCHEDULE-40 PVC 10-SLOT SCREENS. A SAND PACK WILL BE PLACED IN THE ANNULAR SPACE EXTENDING TWO FEET ABOVE THE SCREEN. THE REMAINDER OF THE ANNULAR SPACE WILL BE FILLED WITH BENTONITE GROUT TO THE GROUND SURFACE. EACH WELL WILL BE DEVELOPED USING SURGING AND BAILING, AND OVERPUMPING OR OTHER STANDARD TECHNOLOGIES. LITHOLOGICAL DESCRIPTIONS AND WELL CONSTRUCTION INFORMATION, INCLUDING SURVEYED ELEVATIONS, WILL BE LOGGED FOR EACH BORING AND MONITORING WELL.

AFTER A PERIOD OF ONE WEEK, GROUNDWATER SAMPLES WILL BE COLLECTED FROM EACH MONITORING WELL USING DISPOSABLE BAILERS. A MINIMUM OF THREE WELL VOLUMES WILL BE PURGED PRIOR TO COLLECTING THE SAMPLE. IF A WELL IS PURGED DRY, SAMPLES WILL BE COLLECTED AFTER THE WELL HAS RECHARGED. GROUNDWATER SAMPLES WILL BE SUBMITTED TO A FIXED LABORATORY FOR ANALYSIS OF VOC'S PER METHOD 8260B AND SVOC'S PER METHOD 8270. IF GROUNDWATER IS IMPACTED BY THE CHEMICALS OF CONCERN, THEN A GROUNDWATER PATHWAY CLOSURE PLAN WILL BE IMPLEMENTED.

14.2 SURFACE WATER SAMPLING PLAN

WATER WAS OBSERVED VENTING FROM THE WEST FACE AND OTHER PORTIONS OF THE MOUNDED AREA FOLLOWING A RAIN EVENT THAT OCCURRED DURING THE MAY 2001 FIELD INVESTIGATION. THE FOLLOWING SAMPLING PLAN HAS BEEN DEVELOPED TO DETERMINE IF WATER VENTING FROM

THE SIDES OF THE ELEVATED AREA HAS BEEN AFFECTED BY THE SOIL AND PERCHED WATER CONTAMINATION ON THE MOUND.

SURFACE WATER SAMPLES WILL BE COLLECTED FROM THE WEST FACE OF THE ELEVATED AREA AND AT ANY OTHER LOCATIONS WHERE WATER IS OBSERVED VENTING FROM THE SIDE OF THE ELEVATED AREA. IF NO WATER IS OBSERVED DURING FIELD WORK, SURFACE WATER SAMPLES WILL BE COLLECTED FROM THE ON-SITE DITCH, NORTH OF THE MOUNDED AREA. DITCH SAMPLES WILL BE COLLECTED AT THE NEAREST POINT TO THE UNIT, AT A LOCATION 100 YARDS UP-STREAM FROM THIS POINT, AND AT A LOCATION 100 YARDS DOWN-STREAM FROM THIS POINT. THE WATER SAMPLES WILL BE SUBMITTED TO A FIXED LABORATORY FOR ANALYSIS OF VOC'S PER METHOD 8260B AND SVOC'S PER METHOD 8270.

14.3 FIELD GENERATED WATER COLLECTION AND DISPOSAL PLAN

DURING SITE CLOSURE FIELD ACTIVITIES, WASTEWATER WILL BE GENERATED WHEN PERCHED WATER IS REMOVED FROM THE MOUND, WHEN SURFACE WATER (RAIN) COMES INTO CONTACT WITH THE CONTAMINATED SOILS, AND WHEN EQUIPMENT IS DECONTAMINATED AND RINSEATE WATER IS GENERATED. DUE TO ITS CONTINUOUS CONTACT WITH THE CONTAMINATED SOILS, THE PERCHED GROUNDWATER WILL HAVE THE HIGHEST CONCENTRATIONS OF ORGANICS. THE ON-SITE WWTP CAN HANDLE THE CONCENTRATIONS OF ORGANICS IN THE PERCHED WATER. THEREFORE, THE PERCHED WATER, THE SURFACE WATER, AND THE RINSEATE WATER WILL BE DISPOSED OF AT THE ON-SITE WWTP. NO PRE-TREATMENT ANALYSIS WILL BE RUN ON THE WATER DISCHARGED TO THE WWTP.

THE WATER GENERATED DURING FIELD WORK WILL BE STORED IN A MOBILE 6,500 GALLON STAINLESS STEEL TANK. AS NEEDED, WATER WILL BE REMOVED FROM THE TANK VIA VACUUM TRUCK AND TRANSPORTED TO THE ON-SITE WWTP. THE WASTEWATER WILL NOT LEAVE THE CAMPBELL SITE, THEREFORE NO WASTE MANIFESTS WILL BE GENERATED FOR ITS TRANSPORTATION.

14.4 Waste Characterization Sampling Plan

Elevated concentrations of SVOC and VOCs were identified in soils located in the study area. The waste characterization sampling plan is designed to determine if the contaminated soils on-site are hazardous.

We will submit soil samples from four locations for TCLP analysis. The samples will be collected from near known areas affected with organic compounds, specifically PB-01, PB-01-34, PB-01-32, and PB-01-28. To ensure that representative samples of the on-site materials will be collected, a vertical composite sample will be prepared at each of the above-mentioned four soil sample locations. The first sample of each composite will be collected approximately 1-foot above the known depth of contamination. The second sample will be collected at the known depth of contamination. The third sample will be collected approximately 1-foot below the known depth of contamination. In summary, three discrete grab samples will be collected at each of the above stated locations, at the depth intervals cited below:

Soil Sample Location	Known Depth of Contamination (bsg)	Sample Interval #1	Sample Interval #2	Sample Interval #3
PB-01	5.5'	4'-5' bsg	5'-6' bsg	6'-7' bsg
PB-01-34	8.5	7'-8' bsg	8'-9' bsg	9'-10' bsg
PB-01-32	6.5'	5'-6' bsg	6'-7' bsg	7'-8' bsg
PB-01-28	4.5'	3'-4' bsg	4'-5' bsg	5'-6' bsg

The three sample intervals will be mixed to obtain a composite sample at each of the above stated soil sample locations. The four sample locations will be submitted for TCLP analysis for VOCs and SVOCs.

If the TCLP analysis shows the contaminated soils to be hazardous then work at the site will cease until a hazardous waste delineation investigation can be completed. If the TCLP analysis shows the contaminated soils are non-hazardous, then site cleanup using MTTD technology will proceed as planned.

14.5 Remediation Verification

All contaminated excavated soil will be transported to the on-site MTTD for treatment. It is estimated that 3,330 cubic yards of soil will be treated by the MTTD. Based on an average density of 1.5 tons per cubic yard of soil the MTTD will treat approximately 5,000 tons of soil. The following sampling plan was developed to verify the MTTD has successfully remediated the contaminated soils.

Twelve is the minimum recommended number of samples to ensure statistically significant data. Based on the treatment of 5,000 tons of soil we will collect 1 sample per 400 tons of treated soils to verify cleanup goals have been met.

14.6 Confirmation of Site Clean-up

The following sampling plan has been developed to confirm that concentrations of chemicals of concern remaining in soils left on site are below the site-specific cleanup numbers. Samples will be collected from the excavation sidewalls and floor in the manner described below.

14.6.1 Determination of the Number of Samples

Samples will be collected from the excavation floor and sidewalls to confirm that the maximum remaining soil concentrations for each remaining chemical of concern is below the OEPA calculated multiple chemical adjusted direct contact standards. A grid system will be used to ensure an unbiased selection of sampling points will be collected from the excavation sidewalls and floors. To ensure a large enough sample set for statistical analysis a minimum of 12 samples or 25% of the total grid stations, whichever represents a larger sample set, should be collected.

The *Closure Plan Review Guidance Document for RCRA Facilities, September 2000,* recommends using a grid interval calculation based on contaminant chemical masses. This is difficult to apply at this site, as the holding pit was demolished in 1983 and the remaining dried material was transported off site. Only residuals of the compounds of concern remain at the site. Therefore, a grid interval based on the surface area of the excavation will be applied at this site.

~~When obtaining samples to verify that soil or wastes have been adequately remediated, it is important to insure that the analytical data provide an accurate representation of the entire area or volume being evaluated. The location and number of samples to be taken at a particular remediation site depends on many factors, including the target level of confidence, the variability over space and time of the media to be sampled, and the costs involved. The appropriate sample number can be estimated and the sampling locations can be chosen without bias using appropriate statistical methods.~~

~~Statistical sampling methods typically apply a sampling grid over the remediation area to determine the possible locations for samples to be collected. The grid size is generally determined by the area or volume of the soil to be remediated, modified by existing analytical and/or toxicological information available for the site.~~

~~A minimum of 12 samples or 25%, whichever is larger, of the total grid stations should be sampled and analyzed initially to allow a large enough data pool for statistical analysis. Extra samples are also collected and kept under proper chain of custody and storage procedures in case the statistical analysis indicates that more samples are needed.~~

~~14.6.1~~14.6.2 Sampling Grid Calculations

~~Sampling grids facilitate the unbiased selection of sampling points and accepted statistical tools are used for evaluating the resultant data. The following equations provide a simple basis to establish a grid system to facilitate unbiased selection of sampling points and sample coverage proportional to the area being verified.~~

For excavation, both the sidewalls and bottom areas would be included in the determination of the area size. The following equation is used to determine grid intervals for stationing over a medium sized site (11,000 to 130,000 square feet).

$$GI = (A/\pi)^{1/2} / 4$$

WHERE: A = area to be grid (square feet), including floor and sidewalls

GI = grid interval

= 3.14159

The combined surface area of the excavation floor and the sidewalls is expected to be approximately 20,000 square feet, which results in a calculated grid interval of 20 feet.

~~14.2~~14.6.3 Sampling of Grid

Sampling of grids may include all of the grid stations or a phased subset of the total stations. The subset of grid stations is created by assigning coordinates to all the nodes and randomly selecting nodes using a random number generator or a random number table.

Based on the grid interval calculated for this excavation, there will be approximately 35 grid nodes across the excavation floor, and 21 nodes across the excavation walls, for 56 total possible sample locations. ~~Based on the 25% guideline~~IN ACCORDANCE WITH SECTION 14.6.1, a minimum of 14 samples will need to be collected before statistical conditions can be met. This number of samples is suitable, considering that 51 borings were advanced previously to delineate the vertical and horizontal extent of contamination.

TWENTY (20) SOIL SAMPLES WILL BE COLLECTED FROM THE EXCAVATION FLOORS AND SIDEWALLS. FOURTEEN (14) OF THESE SAMPLES WILL BE ANALYZED FOR VOCS AND SVOCS AND THE REMAINING SIX (6) SAMPLES WILL BE HELD. IF SAMPLING ABNORMALITIES EXIST (PER SECTION 14.6.4, STATISTICAL VERIFICATION) THEN THE HELD SAMPLES WILL BE ANALYZED TO OBTAIN AN ADEQUATE REPRESENTATIVE POPULATION.

~~A minimum of 20 sidewall and floor samples is proposed to verify that the cleanup standards have been met in the excavation. The sample locations will be selected from randomized locations within a grid pattern distributed across the excavation floor, and at nodal distances along the excavation sidewalls.~~

14.6.4 STATISTICAL VERIFICATION

TO ENSURE A REPRESENTATIVE SET OF SAMPLES IS OBTAINED THE COEFFICIENT OF VARIATION TEST WILL BE APPLIED TO THE DISTRIBUTION OF EACH PARAMETER IN THE CONFIRMATION SAMPLES. IF THE INITIAL 14 SIDEWALL AND FLOOR CONFIRMATION SAMPLES ARE NOT STATISTICALLY VALID, THEN THE ADDITIONAL SIX SAMPLES WILL BE ANALYZED FOR THE PARAMETERS OF CONCERN.

14.7 Site Delineation Sampling Plan

To fully delineate the on-site contamination per the EPA's *Closure Plan Review Guidance Document for RCRA Facilities, September 2000*, 2 to 4 consecutive samples in the vertical direction and 2 samples in the horizontal direction must show that the concentrations of constituents are below their respective method detection limits.

The SVOC's chemicals of concern were delineated in both the horizontal and vertical directions, to non-detect limits, during the May 2001 field work (Figures 3A and 3B). The VOC chemicals of concern were delineated to below the laboratory reporting limits in both the horizontal and vertical directions. However, these reporting limits, in most cases, were higher than the method detection limits. Therefore, this sampling plan is designed to delineate the VOC contamination to non-detect values, using appropriate method detection limits, both vertically and horizontally.

Five soil sampling locations around the mound, as depicted in Figure 6, will be used to obtain horizontal delineation of VOCs. As two consecutive horizontal delineation samples must be obtained, a minimum of 10 Geoprobe™ borings will be advanced on the outer edges of the mound. As Figure 6 shows, we are proposing to use the soil samples collected during the installation of the monitoring wells as three of the horizontal delineation samples. The soil samples will be submitted to a fixed laboratory for GC analysis of VOCs using EPA method 8260B. These analytical methods will utilize detection limits appropriate for suspected clean samples. Horizontal site delineation soil sampling will continue until two consecutive samples are non-detect for VOCs.

Vertical delineation for VOCs will be obtained after soil excavation activities. Geoprobe™ borings will be advanced in a minimum of four locations throughout the site excavation. At each boring location a minimum of two consecutive vertical soil samples will be collected. The soil samples will be analyzed per the methods described above.

~~14.3~~14.8 Sample Handling and Analyses

New latex gloves will be worn by the sampling personnel and changed between sample collection events. Samples will be placed in pre-labeled containers provided by the laboratory. Each container will be specifically marked for the parameter to be analyzed. Sample preservatives will be pre-measured and placed into the sample containers by the laboratory. Each sample container will have a label to record the sample identification, sample depth, sample date and time, parameter(s) for analysis, person collecting the sample, and other pertinent data. Once filled, sample containers will be placed in a chilled insulated cooler until it is delivered to the laboratory for analysis. Sample information and handling history will be documented on laboratory supplied chain-of-custody forms.

Samples will be delivered to ~~the B.E.C. Laboratory in Toledo, Ohio,~~ A QUALIFIED LABORATORY for analysis of volatile organic compounds by GC/MS using EPA Method 8260B and semi-volatile organic compounds by EPA Method 8270. ~~VOC samples will be preserved in the field using EPA Method 5035 methanol preservation. B.E.C. is an Ohio VAP certified laboratory and their QA/QC documentation should be on file with the OEPA. Additional QA/QC Plan documentation can be provided to the Ohio EPA upon request.~~

15.0 DESCRIPTION OF REMOVAL EFFORTS AND TREATMENT PROCESSES

Information typically contained in this section is presented in detail in Section 7.0, "Removal of Hazardous Waste and Soil Remediation."

16.0 SPECIFICS FOR WASTE-IN-PLACE CLOSURES

No waste-in-place closure strategy is proposed for this unit. Soils impacted by releases from the former holding pit will remain in place only at concentrations below the site-specific risk based cleanup numbers for direct contact, the exposure pathway applicable to this site.

16.1 Final Cover System Construction and Testing Requirements

The backfill placed into the finished cleanup excavation will consist of overburden and treated soil demonstrated to be clean. Backfill materials will be compacted to ambient density or higher in 2-foot lifts. Final grade of the site will be designed to direct precipitation to the outer edges of the mound area to prevent excessive infiltration.

17.0 CERTIFICATION

Closure of this un-permitted hazardous waste management unit will be certified by Campbell Soup Company, and by an Ohio register professional engineer not directly employed by Campbell Soup Company or any of its subsidiaries. The Certification Report will be submitted within 60 days of completion of closure.

THE CERTIFICATION REPORT WILL INCLUDE, AT A MINIMUM, THE FOLLOWING SECTIONS, AS REQUIRED BY THE *CLOSURE PLAN REVIEW GUIDANCE FOR RCRA FACILITIES, SEPTEMBER 2000:*

- THE CERTIFICATION STATEMENT;
- REFERENCE TO THE APPROVED CLOSURE PLAN;
- THE VOLUME OF WASTE REMOVED OR CLOSED IN PLACE;
- ALL CORRESPONDENCE REGARDING CLOSURE ACTIVITY AFTER OHIO EPA APPROVAL;
- DETAILS OF SAMPLING AND ANALYSIS METHODS;
- LABORATORY RECORDS;
- A NARRATIVE DESCRIBING ALL ACTIVITIES DURING CLOSURE;
- DETAILS;
- POST-CLOSURE CLEAN-UP DOCUMENTATION; AND
- SIGNATURE OF OWNER/OPERATOR AND OF A QUALIFIED, INDEPENDENT, REGISTERED PROFESSIONAL ENGINEER.

The Certification Report will include the following language as required in accordance with OAC Rule 3745-50-42(D):

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for

submitting false information, including the possibility of fine and imprisonment for knowing violations."

18.0 STATUS OF FACILITY AFTER CLOSURE

Upon completion of closure of the former holding pit unit, the facility will continue operating as an industrial site involved with the manufacture of food products. The holding pit area and the surrounding mounded area will no longer be used for the deposition of any potential hazardous materials. Known inert materials, such as fill soil, cinders, and plant clippings may still be deposited in this area.

19.0 COST ESTIMATES FOR CLOSURE AND POST CLOSURE

The cost for closing the former holding pit and surrounding impacted soils is estimated to be between $500,000 and $600,000, as detailed in Table 4. Because the closure plan presented herein represents a permanent solution to residual contaminants resulting from the former holding pit, there will be no post closure activities required once closure has been accepted by the OEPA.

Benzo (a) Pyrene	29	ND	ND	ND	ND	ND	ND	ND
Indeno (1,2,3-cd) Pyrene	291	ND	ND	ND	ND	ND	ND	ND
Benzo (g,h,i) Perylene	150	ND	ND	ND	ND	ND	ND	ND

Notes:

1. Bolded concentrations are above the Direct Contact Soil Standard, Multiple Chemical Adjusted values.
2. ND-Compound was analyzed for but not detected.
3. E- Identifies compounds whose concentrations exceed the calibration renge of the instrument for that specific analysis.

TABLE 4

COST ESTIMATE - ONSITE THERMAL TREATMENT
Campbell's Soup Company, Napoleon, Ohio

Cost Estimate Assumptions	
Excavation Area, sq.ft.	11,000
Volume of Clean Soil *(in situ)*, cu.yd.	1,630
Volume of Contaminated Soil *(in situ)*, cu.yd.	3,259
Volume of Clean Soil *(ex situ)*, cu.yd.	1,956
Volume of Contaminated Soil *(ex situ)*, cu.yd.	3,911
Mass of Clean Soil *(ex situ)*, tons	2,836
Mass of Contaminated Soil *(ex situ)*, tons	5,671
Treatment Time, days	57

Task	Work Elements	Unit	Unit Cost	Qty	Total Cost
Engineering Design	Prepare Plans and Specifications	lump sum	$20,000	1	$20,000
Health & Safety	Prepare Plan	lump sum	$5,000	1	$5,000
	Personal Protective Equipment	man-day	$100	57	$5,671
	Setup Air Monitoring	lump sum	$1,200	1	$1,200
	Conduct Air Monitoring (ambient)	day	$25	57	$1,418
Site Preparation	Survey	lump sum	$500	1	$500
	Clearing/Grubbing	sq.ft.	$2	11000	$22,000
	Electrical Service Panel and Feeder	lump sum	$1,500	1	$1,500
	Cooling/Quench Water Hookup	lump sum	$500	1	$500
	Exclusion Area Setup	lump sum	$2,500	1	$2,500
	Runoff Controls (Silt Fence)	lump sum	$1,250	1	$1,250
MLTD (per quotation)	Excavate Clean Soil	ton	$3.75	2836	$10,633
	Excavate Contaminated Soil	ton	$3.75	5671	$21,267
	Process (MLTD Plant & Operator, Loader w/certified scales & Operator, Propane)	ton	$41	5671	$232,516
	Backhoe, Dozer and Loader	lump sum	$2,000	1	$2,000
Sampling	Confirmation Sampling (1 per 20 cu.yd.)	each	$120	98	$11,733
	Baseline Sampling (1 per 50 tons)	each	$120	78	$9,387
	Treatment Sampling (1 per 50 tons)	each	$120	113	$13,611
	Off-gas Sampling (1 per day)	each	$200	57	$11,342
Replace Soils	Return Clean and Treated Soils	ton	$4	8507	$31,900
	Grade and Vegetate Cover	sq.ft.	$2	11000	$22,000
Demobilization	Demolish Runoff Controls	lump sum	$500	1	$500
	Dismantle Exclusion Area	lump sum	$1,200	1	$1,200
Construction	Provide Field Office (Trailer)	week	$250	9	$2,250
	Construction Management	manhour	$90	193	$17,408
	Construction Oversight	manhour	$65	567	$36,862
Reporting	Weekly Progress Reports	manhour	$65	113	$7,372
	Closure Report	manhour	$75	180	$13,500
	Subtotal Calculated Cost				*$507,020*
	Contingency Cost (10%)				*$50,702*
	Total Estimated Cost				*$557,722.00*

POTENTIAL PATHWAYS

DIRECT CONTACT, SOIL = INGESTION, INHALATION, DERMAL (DURING EXCAVATING ACTIVITIES ONLY)
DIRECT CONTACT, WATER = DERMAL (DURING EXCAVATION ONLY)
ECOLOGICAL, WATER = IMPACTS VIA SEEPS

GROUNDWATER IN CARBONATE BEDROCK AT
100+ FEET - LEACHING IS NOT PATHWAY - NO WELL WITHIN 1-MILE.
NO BUILDING OR UNDERGROUND AREAS; THEREFORE,
NO VAPOR INTRUSION POTENTIAL.

CONTAMINANTS COVERED BY 5-FEET OF FILL.
NO VOLATILIZATION OR DIRECT CONTACT EXPOSURES
UNTIL EXCAVATED.

May 15, 2002

Ms. Lesa Bagby
Geotrans, Inc.
710 Avis Drive
Ann Arbor, MI 48108

Dear Ms. Bagby,

Attached are the revised analytical results from the mobile laboratory services provided in Napoleon, OH. The reports have been revised to reflect "J" values for those compounds detected at levels below our normal reporting levels (RLs), but above the method detection levels (MDLs) for that instrument. Please be advised that in some cases, the reasons for setting the RLs many times higher than the MDLs have to do with the compounds "hanging up" in the system. This is particularly so in the case of acetone, MEK, methylene chloride, and TCE. At "J" value levels, these compounds are just as likely to be in the equipment as in the sample. Visual review of the chromatograms revealed a distinct gasoline pattern on many. Further review of the data also revealed a rounding error, effecting the result for p&m-xylene reported for sample PB-01-28 (7-8'). The xylenes had originally been reported at 110 ppb and were corrected to120 ppb.

New Age/Landmark, Inc. certifies that to our best knowledge this data package is in compliance with the terms and conditions of the contract, both technically and for completeness. Release of the data contained in this hard copy data has been authorized by the laboratory's president or his designee.

Please review the report and contact our office if you have any questions or need additional information. Thank you for choosing New Age/Landmark, Inc. for this important project. We look forward to working with you again in the future.

Sincerely,

Kristen A. Carlyon
QA/QC Officer

Remediation Feasibility Analysis Summary

Remediation Technology Evaluation Matrix
Former Sludge Holding Pit - Campbells Soup Company, Napoleon, Ohio

Treatment Alternative	Description	Advantages	Disadvantages	Cost
Low-Temperature Thermal Desorption Cost: $$$ Performance: ★★★	▪ Excavate overlying fill soils ▪ Mobilize LTTD unit to site ▪ Excavate contaminated soils in 20 cy lifts for composite sampling ▪ Treat soils in excess of cleanup levels with LTTD ▪ Sample and analyze treated soil lift ▪ Return treated soil to excavation ▪ Return excavated fill soils to excavation ▪ Grade and vegetate filled area	▪ Relatively easy permitting ▪ Proven technology with minimal treatment risk ▪ Many vendors available for competitive pricing ▪ Rapid treatment time (5-20 tons/hour) ▪ Completion in less than six months ▪ No long term site monitoring expected ▪ Destroys contaminants ▪ No deed restrictions expected ▪ No off site liability	▪ Moisture content of solids affect treatment time and cost ▪ Large or abrasive material must be segregated ▪ Plastic or clayey material may require use of shredder and other amendments ▪ Off site disposal of treated soils if replacement denied ▪ Costs sensitive to soil volume	▪ $5/cy for excavation ▪ $5/cy for replacement ▪ $25K to $75K mobilization charge ▪ $50 to $150/ton for treatment ▪ $10K/acre regrade and vegetate ▪ Total potential cost = **$150K to 350K**
On Site Landfarming (Composting) Cost: $$ Performance: ★★★	▪ Prepare area for landfarm (install liner/berm) ▪ Excavate/stockpile overlying fill soils ▪ Excavate contaminated soils ▪ Construct landfarm with contaminated soils, 1.5-feet-deep, in windrows with fluffing agents (sawdust, peat, amendments) ▪ Return fill soils to excavation ▪ Complete weekly tilling of windrows for six months. ▪ Conduct composite sampling of landfarm ▪ Regrade and seed landfarm area.	▪ Proven technology with below average treatment risk ▪ Minimal design and monitoring ▪ Moderate treatment time ▪ Costs minimally sensitive to soil volume ▪ Destroys or volatilizes contaminants ▪ No long term site monitoring expected ▪ No deed restrictions anticipated ▪ No off site liability	▪ Large material must be removed from soils prior to construction ▪ Plastic or clayey material may require use of shredder ▪ Leachate may require treatment if reuse in compost denied ▪ Large land area required (1/2 to 1 acre) ▪ VOCs emitted during tilling may require capture and treatment ▪ Permitting may prove difficult without liner/leachate collection ▪ Off site disposal of treated soils if replacement denied	▪ $5/cy for excavation ▪ $5/cy for replacement ▪ $25K-$50K Lab studies and design ▪ $30 to $125/cy for treatment ▪ $10K/acre regrade and vegetate ▪ Total potential cost = **$100K to 200K**
On-Site Bioreactor Cost: $$$ Performance: ★★	▪ Prepare onsite area for above-ground bioreactor (liner, leacheate collection, berm) ▪ Excavate/stockpile overlying fill soils ▪ Excavate contaminated soils ▪ Construct bioreactor in 2' lifts with aeration/drip piping network installed between lifts ▪ Return fill soils to excavation and regrade ▪ Cover bioreactor and install aeration/nutrient drip equipment ▪ Conduct aeration/nutrient addition activities for 12 to 24 months. ▪ Collect soil borings from bioreactor for analyses. ▪ Decommission bioreactor/return treated soils to excavation or elseware onsite and regrade.	▪ Requires less land area than laodfarming (composting) ▪ Proven technology with average treatment risk ▪ Moderate design and monitoring ▪ Moderate treatment time ▪ Costs minimally sensitive to soil volume ▪ Destroys or volatilizes contaminants ▪ No long term site monitoring expected ▪ Easier to contain volatile emissions than composting ▪ No deed restrictions anticipated ▪ No off site liability	▪ Large material must be removed from soils prior to construction ▪ Plastic or clayey material may require use of shredder ▪ Leachate may require treatment if reuse in biorcactor denied ▪ Moderate land area required ▪ Remote location may require power supply installation ▪ VOCs emitted during aeration may require treatment prior to discharge ▪ Off site disposal of treated soils if replacement denied	▪ $5/cy for excavation ▪ $5/cy for replacement ▪ $50K-$75K lab studies and design ▪ $100 to $175/cy for treatment ▪ $10K/acre regrade and vegetate ▪ Total potential cost = **$150K to $350K**
Off-Site Disposal Cost: $$$$ Performance: ★★★★	▪ Excavate/stockpile overlying fill soils ▪ Excavate/sample/analyze contaminated soils in 20 cy lifts (roll-off containers) ▪ Transport contaminated soils to TSDF for disposition ▪ Return clean soils to excavation ▪ Regrade and vegetate excavation	▪ No treatment risk ▪ Minimal design and no monitoring ▪ Very rapid completion ▪ No permitting ▪ No deed restriction anticipated	▪ Off site liability associated with disposal at TSDF ▪ Transportation risks ▪ Costs very sensitive to soil volume requiring disposal	▪ $10/cy excavation and replacement of fill ▪ $7/cy excavation, loading and storage of contaminated soils ▪ $10-$30/ton transportation ▪ $200 to $300/ton tipping fee ▪ Total potential cost = **$250K to $700K**
RCRA Capping Cost: $ Performance: ★	▪ Install multi-layer Subtitle C cap over former holding pit area. ▪ Obtain and maintain TSD permit for site	▪ Routine, accepted method for addressing on-site, above-ground wastes at TSD facilities ▪ Moderate design and monitoring ▪ Minimal risk for off-site liability	▪ TSDF permitting required ▪ Long term liability that may require additional closure action when site is sold or transferred ▪ Deed restriction required	▪ $200K per acre for cap ▪ Unknown, but likely high cost of permitting facility ▪ Total potential cost = **$50K to $150K**

Remediation Technology Evaluation Matrix
Former Sludge Holding Pit - Campbells Soup Company, Napoleon, Ohio

On-Site Engineered Landfill Cost: $$$ Performance: ★	■ Construct liner and leacheate collection systems ■ Excavate/stockpile overlying soils ■ Excavate contaminated soils and place in landfill ■ Return stockpiled soils to excavation, regrade and vegetate ■ Construct cap on landfill ■ Operate/Monitor leacheate collection system ■ Obtain/maintain TSD permit.	■ Accepted method for addressing ongoing waste disposal at TSD facilities	■ TSDF permitting required ■ Long term liability that will require additional closure action ■ Deed restriction required ■ Not generally applicable for small-quantity generators or sites with accumulated wastes. ■ Waste may require treatment to achieve LDR levels prior to disposal	■ $25 to $100/cy of lanfill capacity ■ Additional treatment costs if needed ■ Total potential cost = **$200K to $300K**
In Situ Stabilization Cost: $$$ Performance: ★	■ Excavate/stockpile overlying fill soils ■ Apply grout/polymeric stabilizer to contaminated soil volume using deep soil mixing techniques (twin augers) ■ Return fill soils to treated area, grade and vegetate.	■ *In situ* method, no excavation required, but excavation of fill soil may be advisable for cost purposes. ■ Applicable for most inorganics and SVOCs ■ Relatively rapid construction time	■ Stabilization of VOCs can be difficult ■ Contaminants not destroyed ■ TSDF permitting may be required ■ May be less effective than cap ■ Additional closre activity may be required at later date ■ Deed restriction required	■ $10/cy fill soil excavation and grading ■ $80 to $120/ton for stabilization ■ TSDF permitting costs additional if required ■ Total potential cost = **$150K to $300K**
In Situ Bioremediation (Bioventing) Cost: $$ Performance: ★★	■ Install network of shallow bioventing wells for injection of air/nutrients and extraction of soil vapor ■ Install vapor membrane to increase radial effectiveness ■ Install bioventing equipment including offgas treatment (carbon), extraction pump, injection blower, equipment enclosure and utility piping. ■ Operate systems for 24 months ■ Collect soil borings to verify treatment ■ Remove wells and equipment.	■ Contaminants treated *in situ*, no excavation required ■ Proven technology with above average treatment risk ■ Easily permitted	■ Hetergeneous soil may extend treatment time and limit effectiveness ■ Treatment time may extend beyond 3 years ■ Offgas may require treatment prior to discharge ■ Laboratory and field pilot testing are recommended prior to full-scale treatment	■ $15K laboratory testing ■ $50K for pilot testing and design ■ $10 to $50/cy treatment ■ Total potential cost = **$125K to $200K**

RE: SOIL INVESTIGATION
EXPANSION OF WATER AND
WASTEWATER FACILITIES
CAMPBELL SOUP COMPANY
NAPOLEON, OHIO
P.O. NO. 004-010494
T.T.L. JOB NO. DR-11237

Dear Mr. Junge:

This letter report presents the results of a soil boring investigation performed at the above referenced project. The site of the proposed development is located within the limits of the existing Campbell Soup Facility in Napoleon, Ohio. The purpose of this investigation is to determine the physical characteristics of the subsoils at the site. The test borings were drilled at the location shown on the Test Boring Location Plan, Plate 1.

On November 28 through 30, 1989, a field investigation consisting of nine test borings was performed at the site by our drilling personnel. The test borings were drilled with a truck mounted, rotary drilling rig, utilizing four inch diameter solid stem augers to a depth of 30.0 feet below the ground surface. Soil samples were taken at 2.5 and 5.0 foot intervals.

Soil samples were obtained by the Standard Penetration Test Method (ASTM D 1586) which consists of driving a two inch outside diameter split-barrel sampler into the soil with a 140 pound weight falling freely through a distance of thirty inches. The sampler is driven in three successive six inch increments with the number of blows per each increment being recorded. The number of blows required to advance the sampler the last twelve inches is termed the Standard Penetration Resistance (N) and is presented on the individual Logs of Test Boring. The split-barrel sampler contained a 1.375 inch inside diameter and three inch long liner

Toledo Testing Laboratory

Mr. D.R. Junge
Campbell Soup Company
Napleon, Ohio 43545

insert. All soil samples obtained with the split-barrel sampler were sealed in glass jar containers and kept by a representative of Campbell Soup Company.

Soil conditions encountered in the test borings have been evaluated and are presented in the form of Logs of Test Boring, Figures 1 through 20. In addition, the boring logs present information relating to sample data, standard penetration test results, water conditions observed in the borings, personnel involved and other pertinent data. It should be noted that the logs included with this report have been prepared on the basis of field logs of the soils encountered.

Based on the results of the field and laboratory investigation, the subsurface conditions appear to be generally uniform. The site is blanketed with topsoil or crushed stone about 2.0 inches to 3.5 feet thick. Underlying the surface materials in Test Boring Numbers 1, 5, 8 and 9 is a fill layer of medium stiff to stiff brown to grey to black silty clay with some sand or loose to medium dense brown clayey sand to silty sand with some gravel which was found down to 2.0 to 8.5 foot depth. Below the surface materials and fill soils in all test borings is a native cohesive stratum of soft to hard brown to brown and grey silty clay to clayey silt with varying amounts of sand and gravel and occasional silt and sand seams which was encountered down to 12.0 to 23.5 foot depth. Beneath this stratum and extending throughout the remainder of each test boring is a deposit of stiff to very hard grey silty clay to clayey silt with varying amounts of sand and gravel and occasional silt and sand seams.

Groundwater seepage readings were recorded in Test Boring Numbers 7 and 9 at a 7.5 to 23.0 foot depth at the time of the drilling operations. Twenty-four hour water level readings were recorded in Test Boring Numbers 4 and 5 at a 0.5 to 12.0 foot depth. All other test borings were found dry upon completion of the drilling operations.

Experience indicates that the actual subsurface conditions at a site could vary from those shown on the Logs of Test Borings made at specific locations. Toledo Testing Laboratory is not responsible for any interpretations or conclusions concerning the subsurface conditions made by others based upon this report.

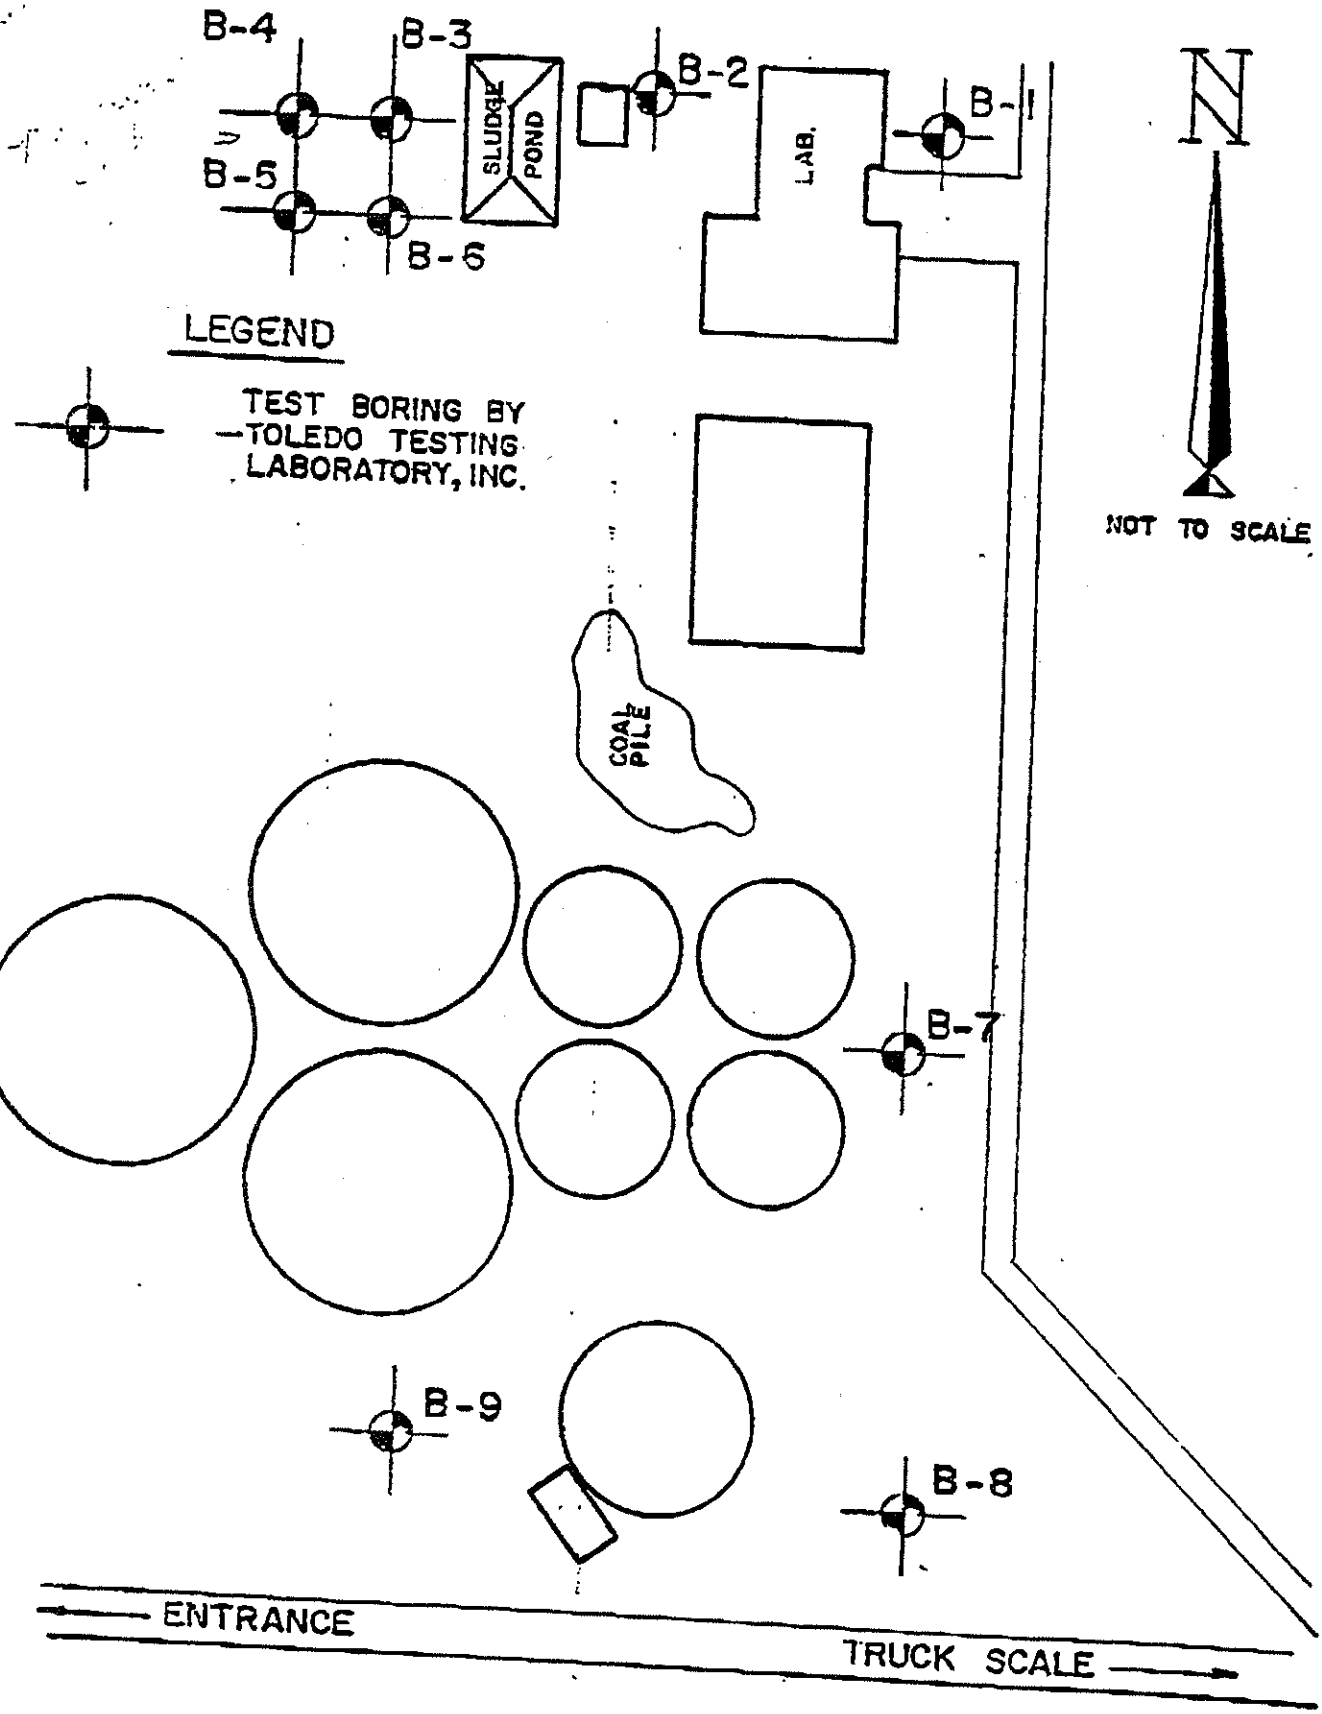
Page: 3

Soil samples collected during this investigation will be stored at our laboratory for a period of ninety days from the date of this report. The samples will be discarded after this time unless you request that the samples be saved or delivered to you.

It is hoped that the data presented herein is sufficient to fulfill your present requirements. Should you have any questions or require additional information, please contact our office.



Very truly yours,

APPENDIX B ANALYTICAL REPORT

SHALLOW GROUNDWATER REPORT

On August 1, 2002, the Ohio Environmental Protection Agency (Ohio EPA) approved, with modifications, the *RCRA Site Closure Plan, Former Holding Pit Unit,* (Closure Plan), dated May 24, 2002, for the Campbell Soup Supply Company in Napoleon, Ohio. The Ohio EPA modification #6 states "Section 8, Schedule for Closure. The revised closure plan is hearby modified to state all information gathered during the shallow groundwater investigation shall be submitted to the Ohio EPA, NWDO within 30 days of the installation of the last monitoring well." This report is intended to satisfy modification #6 of the Closure Plan.

On August 26 and 27, 2002, the third phase of field work for the site closure of the former holding pit was completed at the Campbell Soup Supply Company's Napoleon, Ohio, Plant. During this field work three monitoring wells were installed to determine whether shallow groundwater had been impacted by the soils contained in the elevated area.

All of the field work completed was conducted in general agreement with the Closure Plan. GeoServ, Inc. of New Hudson, Michigan, performed the subsurface fieldwork using a track-mounted drill rig equipped with direct-push and hollow-stem auger equipment. John Weaver and James Mosely, representatives from the Ohio EPA, were present on August 26, 2002, to observe the fieldwork.

Direct-push sampling techniques were used to collect the fourth of four soil samples required to characterize the contaminated soil for waste disposal. The sample was collected from a continuous soil sample from 1-6 feet below surface grade (bsg) near PB-02-28. The sample was screened with the photo-ionization detector (PID) and prepared for composite sampling. The composite sample was obtained from a mixture of three discrete samples collected from 3-4 feet bsg, 4-5 feet bsg and 5-6 feet bsg. This composite sample was sent to the TTMPS laboratory of Ann Arbor, Michigan, for TCLP analysis.

Direct-push sampling techniques were used to collect continuous soil samples required to determine the horizontal extent of soil contaminated with VOCs beyond the limits of the elevated area. Two borings were completed at five soil sampling locations around the mound, as depicted in Figure 1. The intent of installing two borings at each location was to ensure that horizontal extent of contamination was adequately delineated.

The primary boring at each location was terminated at 20 feet bsg. The secondary boring was installed farther away from the holding pit, and terminated at a depth of 5 feet. Soil samples collected from each boring were field screened using a PID at two-foot intervals, or when visual and olfactory observations suggested additional screening. Lithological descriptions and the results from the PID field screening were recorded for each soil boring and are summarized in the attached soil boring logs (Appendix A).

Three distinct soil horizons were characterized based on the soil samples retrieved at the borings. The upper horizon consists of a brown clay fill with varying amounts of silt from the surface to approximately 4.5 to 8 feet bsg. The second horizon is orange brown, dry, clay till that extends to approximately 12 to 16.5 feet bsg. The third horizon is gray, damp to moist clay till that extends to the termination of the borings at 20 feet bsg. The PID did not detect the presence of VOCs in any of the soil samples tested.

Because the PID did not detect the presence of VOCs in any of the screened soil samples, the soil samples selected for laboratory analyses were chosen on the basis of depth. The upper soil samples were collected from 4.5 to 5 feet bsg from both borings at each location. A third sample was collected at each location from 19.5 to 20 feet bsg in the primary soil boring. A total of 15 samples, three from each location, were collected and submitted to the laboratory for analyses. Each soil sample was preserved in the field with five-gram Encore™ sample devices. Three replicate 5-gram Encore™ samples were collected from each soil sample interval. The 15 soil samples were dropped off at BEC Laboratory of Toledo, Ohio, for analysis of VOCs per EPA method 8260B.

To adequately characterize any affects to shallow groundwater in the natural unconsolidated zone, groundwater-monitoring wells were installed at three of the five soil borings depicted in Figure 1. Following completion of the soil boring used for soil sampling, hollow stem auger drilling techniques were used to install each groundwater monitoring well. Since saturated conditions were not observed in any of the soil borings, each monitoring well was screened from 15 to 20 feet bsg. Each well was constructed of 2-inch diameter schedule-40 PVC casing with 2-inch diameter schedule-40 PVC 10-slot screens. A sand pack was placed in the annular space extending two feet above the screen. The remainder of the annular space was filled with bentonite chips to the surface. The wells were not developed

since groundwater was not present upon completion. All of the top of casing elevations and the surface elevations were determined by level survey at each groundwater monitoring well and soil boring location.

One day after initial completion of the monitoring well installation MW-1 exhibited more than 4 feet of water, MW-3 exhibited 0.2 feet of water, and MW-2 was still dry. MW-1 was bailed dry and monitored for recovery for approximately 10 minutes. MW-1 recovered at an approximate average rate of 0.03 feet per minute, with recovery slowing over time.

On September 9, 2002, two weeks after well installation, each monitoring well was gauged to determine water levels. 14.43 feet of water was observed in MW-1, 6.14 feet of water was observed in MW-2, and 6.71 feet of water was observed in MW-3 (Table 1). Groundwater elevations are presented in Table 1. MW-1 and MW-3 exhibit similar groundwater elevations at 667.17 feet and 666.51 feet above mean sea level (AMSL) respectively. The groundwater elevation at MW-2 was significantly lower at 658.31 feet AMSL. Our preliminary evaluation of the water levels suggest two possibilities for this discrepancy: MW-2 had not fully recharged due the high clay content of soil; or MW-2 is located in separate water bearing unit isolated from MW-1 and MW-3.

MW-1 14.43 MW-2 6.14 MW-3 6.71

TABLE 1

Boring ID	Surface Elevation	Total Depth Elevation	Depth to Water	Top of Casing Elevation	Water Elevation
MW-1	672.74	652.74	8.03	675.2	667.17
MW-2	672.17	652.17	16.21	674.52	658.31
MW-3	679.8	659.8	15.9	682.41	666.51

Groundwater samples were collected from each monitoring well using disposable bailers. Three well volumes were purged prior to collecting the sample from MW-1. MW-2 and MW-3 were purged dry and samples were collected after the well recharged. All of the groundwater samples were submitted to Brighton Analytical, Inc. of Brighton, Michigan. The groundwater samples were analyzed for VOC's per Method 8260B and SVOC's per Method

8270. Copies of the laboratory report are included as Appendix B. VOCs and SVOCs were not detected in any of the groundwater samples.

CONCLUSIONS

Based on the above-described results, we offer the following conclusions:

- Groundwater may be present in low-permeability clays under the site. These clays are incapable of producing usable amounts of water, but can provide water sufficient to sample given adequate recharge time.

- The water levels in the wells suggest that soil coloration may be representative of saturated conditions, but the disparity in water levels suggest that the wells are not hydraulically connected.

- No VOCs or SVOCs have impacted groundwater under the former holding pit.

Groundwater beneath the mound has not been impacted by VOCs or SVOCs, therefore no additional groundwater investigation is warranted at this site.

Attention: Dr. Osman M. Aly
Director of Environmental Affairs

We are pleased to submit our "Work Plan for Phase II Environmental Site Assessment at Campbell Soup Company Plant, Napoleon, Ohio".

The objectives of the project will be to evaluate the site for the presence of subsurface contamination from the pouring of spent solvents on top of coal stored in the stockpile area. This assessment is in response to a Notice of Violation issued by The Ohio Environmental Protection Agency.

We appreciate the opportunity to be of service to you on this project. Please call if you have any questions or need additional information.

Respectfully submitted,

ONE OF THE LAW COMPANIES

1.0 INTRODUCTION

Law Engineering, Inc. is pleased to submit this work plan which outlines the work to be performed at the Campbell's Soup Company Plant in Napoleon, Ohio, as shown on Figure 1, Site Location Map.

This work plan was prepared to satisfy the current requirements of the Ohio Environmental Protection Agency.

1.1 PROJECT BACKGROUND

The subject site is currently occupied by a soup production and canning complex. This assessment is being performed in response to a Notice of Violation presented to Campbell's Soup Company by the Ohio Environmental Protection Agency (EPA) dated April 26, 1994 and the subsequent letter dated June 16, 1994. The Ohio EPA alleges that certain contamination of the surface soils in the coal stockpile area adjacent to the power plant may have occurred as a result of pouring spent solvents over the boiler coal supply prior to burning. The Ohio EPA requested that samples be obtained from the area beneath the coal pile where solvents were previously poured and from the area beneath the coal pile where no solvents are poured.

1.2 OBJECTIVE AND SCOPE

A Phase II Site Assessment will be performed to evaluate the impact of pouring the solvents on the coal pile on the underlying soil.

The proposed work is summarized as follows:

- Prepare this work plan and a Health and Safety Plan.

- Hand auger and sample ten soil borings.

- Perform laboratory analyses on selected soil samples.

- Submit an assessment report documenting the work performed and present our conclusions and recommendations regarding the site.

1.3 PROJECT ORGANIZATION

Law Engineering, Inc. has identified Mr. Daniel T. Elliott as the overall project manager. Mr. Elliott will also be responsible for technical oversight during performance of the work, and Mr. James DeLano will be responsible for supervision of the field activities. On-site field supervision of both our personnel and subcontractors will be performed by Mr. James DeLano, who will also serve as on-site Health and Safety Officer.

ooOoo

2.0 TECHNICAL APPROACH

This section presents our understanding of the requirements of the environmental site assessment and the technical approach we will use to meet these requirements. The major tasks are as follows:

Site Visit
Health and Safety Plan
Soil Sampling
Laboratory Analysis
Data Evaluation and Reporting

Our approach to these tasks is presented in the following sections.

2.1 SITE VISIT

We visited the site to obtain information for preparation of this work plan as well as a site-specific Health and Safety Plan.

2.2 HEALTH AND SAFETY PLAN

The Health and Safety Plan provides site-specific health and safety controls to be followed during the drilling and sampling activities. The Health and Safety Plan is presented in Appendix A and will be available to all on-site personnel during the field activities.

The elements of the plan will include the following:

Identification of potential Physical Hazards
Identification of potential Chemical Hazards
Level of Protection required for on-site personnel

Emergency Medical Care Information

Chemical hazard information is presented on the attached Material Safety Data Sheets (Appendix B).

2.4 SOIL SAMPLING

2.4.1 Soil Boring Construction

A total of five soil borings will be advanced using a hand auger at the subject site as shown in Figure 2. The borings will be located as follows:

- Four 5-foot deep hand auger borings will be located beneath the area where spent solvents were poured on the coal pile.

- One hand auger boring will be advanced to a depth of 5-feet near the east side of the coal storage and mixing area. This sample will be obtained from an area beneath the coal pile where no solvents were poured. This sample will be used as the comparison sample for the samples obtained from areas beneath the coal pile where solvents were poured.

On completion, the borings will be backfilled with native soil material.

2.4.2 Soil

Undisturbed soil samples will be taken at depths of one feet and five feet below the ground surface. The soil samples obtained at a depth of one foot will be used to assess the impact of the pouring of spent solvents on the coal pile. The soil samples obtained from a depth of five feet will be used to assess the potential migration of contaminants, if any. The soil samples obtained from beneath the coal pile where spent solvents were poured will be

compared to the areas where solvents were not poured on the coal pile. The samples will be acquired with a hand sampler driven ahead of the hand auger. The samples will be retained in clean brass sleeves that will be capped with Teflon-lined plastic caps, labeled, and placed into a chilled ice chest. Duplicate soil samples will be screened for the presence of volatile organic vapors using a portable photo-ionization detector (PID).

The samples will be collected and logged by one of our field engineer/scientists. The samples will be stored in an insulated ice chest until transportation to a state-certified laboratory for analysis. The appropriate Chain-of-Custody documentation will accompany the samples at all times.

2.4.3 Decontamination Procedures

The downhole augering equipment will be steam cleaned prior to use. The sampling equipment and brass sleeves will be washed prior to use using the standard EPA three bucket wash/rinse.

2.5 LABORATORY ANALYSIS

Ten soil samples were selected based on field observations and PID readings will be chemically analyzed for Volatile Organic Compounds (VOCs) by EPA Method 8240 and for semi-volatile organic compounds by EPA Method 8270.

For the purpose of developing this work plan, we have assumed the following:

- Ten soil samples will be analyzed for volatiles by EPA Method 8240.
- Ten soil samples will be analyzed for semi-volatile organic compounds by EPA Method 8270.

2.6 WASTE DISPOSAL PROCEDURES

Soil cuttings from the borings will be used to backfill the hand auger borings.

2.7 DATA EVALUATION AND REPORT PREPARATION

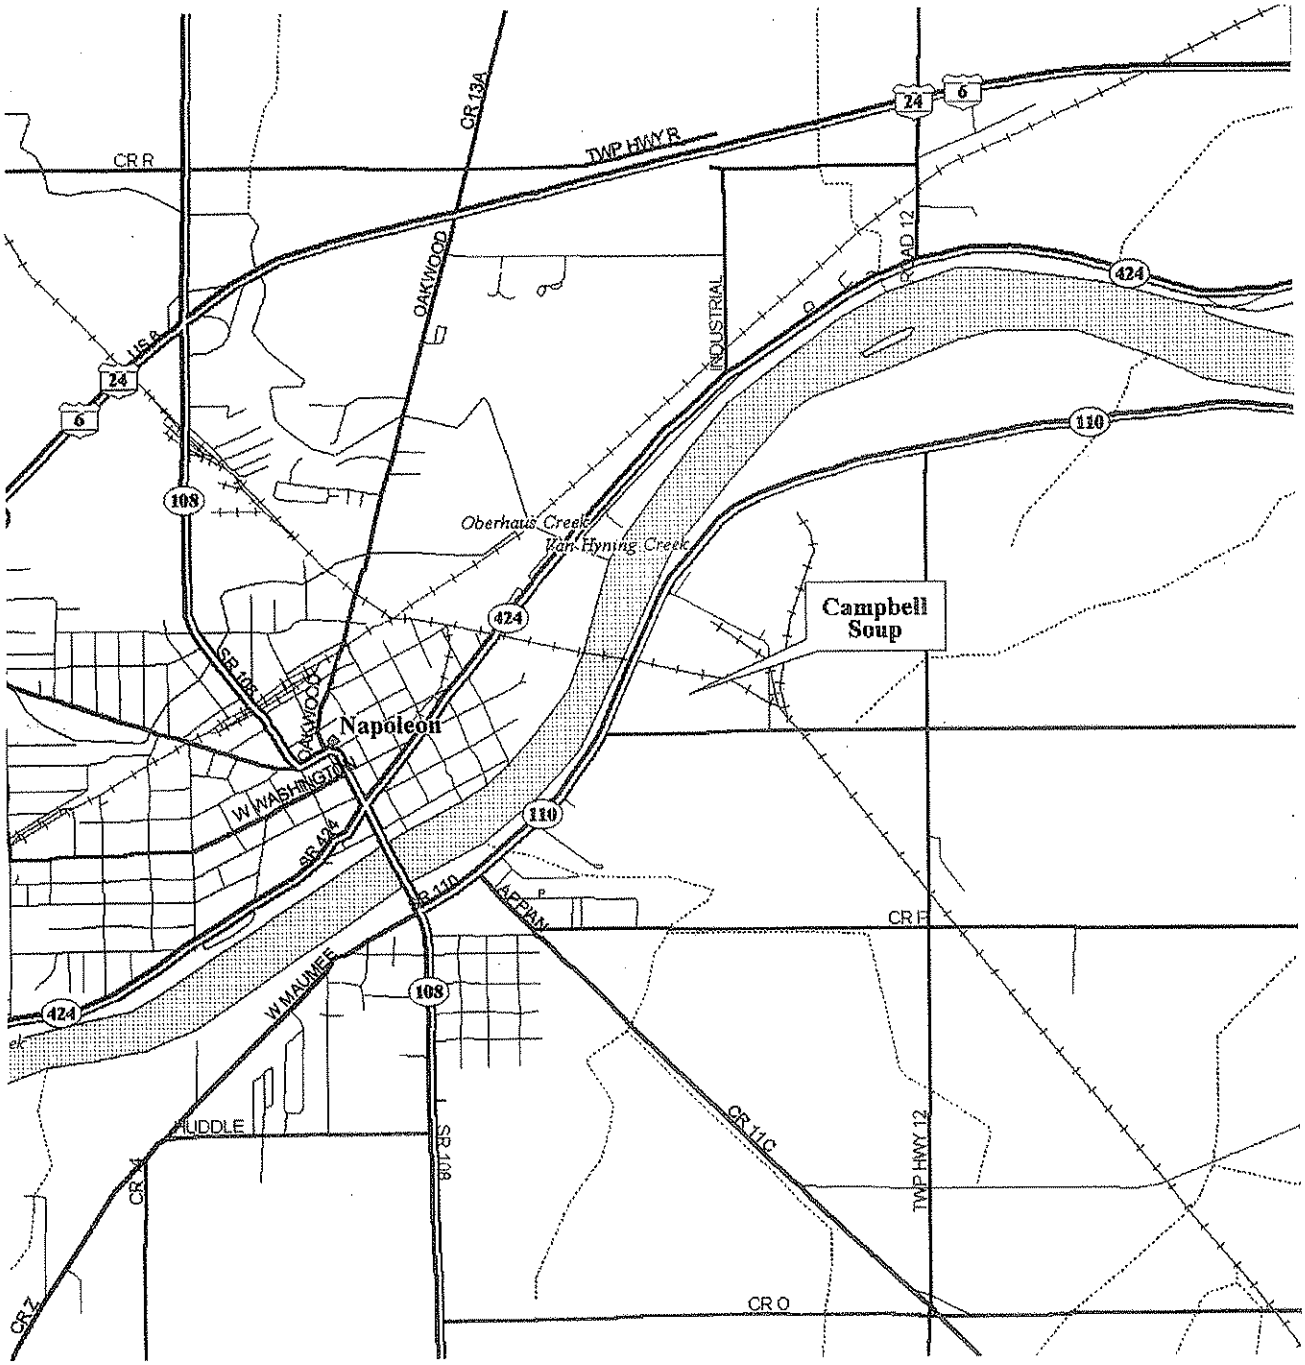
We will evaluate the field and laboratory data and summarize the findings of our assessment work in a written report that will contain field observations, laboratory data, conclusions and recommendations. The report will contain copies of laboratory analytical data, Chain-of-Custody documentation, as well as site sketches, boring logs, and other graphics as needed. The report will include a discussion of contaminants (if present) and their concentrations.

ooOoo

3.0 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC) PLAN

Quality Assurance/Quality Control (QA/QC) procedures will be performed to ensure the accuracy and precision of field and laboratory methods.

Field documentation will include a daily field record, manifests, and sample Chain-of-Custody records. The daily field record will include information such as personnel on-site, discussion of activities performed, work completed, Health and Safety monitoring records, field observations, and other pertinent data.



The following are attached and complete this report:

1.0 INTRODUCTION

The Health and Safety Plan provides site-specific health and safety controls to be followed during the site assessment field activities to be performed at the Campbell Soup Company/Napoleon Plant. The elements of this plan include procedures for personnel protection, personnel and equipment safety, medical surveillance, air quality monitoring, and general work practices for Law Engineering, Inc. and our subcontractors. This plan also details the proper emergency procedures including emergency response and first-aid capabilities. Compliance with this Health and Safety Plan is required of workers and third parties who enter the field operation areas during the field activities.

The purpose of this Health and Safety Plan is to describe the anticipated physical and health hazards, controls, and procedures needed to minimize the accident and injury risks associated with field work conducted during the field activities at the subject facility.

The provisions specified here are intended to conform to applicable State environmental and occupational health and safety regulations. These control measures will apply to field personnel who participate in the field work. Field personnel will continuously monitor the site conditions to ensure that the field work does not endanger surrounding on-site and off-site personnel.

ooOoo

2.0 ASSIGNMENT OF RESPONSIBILITIES

2.1 INTRODUCTION

The following sections briefly describe the health and safety personnel responsibilities which will be employed during the site assessment activities at the site.

2.2 SITE HEALTH AND SAFETY COORDINATOR

The Site Health and Safety Coordinator (SHSC) is responsible for the development of the site plan. These areas of responsibility include hazard assessment, medical requirements, training requirements, air monitoring, personal protective equipment, site control, decontamination protocol, emergency actions and record keeping.

2.3 FIELD SUPERVISOR/SITE SAFETY OFFICER

The field supervisor is responsible for field implementation of the plan and is the Site Safety Officer (SSO). This includes communicating specific requirements to site personnel and consulting with the health and safety coordinator on safety and health requirements. The field supervisor, in conjunction with the Site Health and Safety Coordinator will implement emergency actions, as necessary. The field supervisor has final authority at the site.

2.4 SITE PERSONNEL

Site personnel are responsible for understanding and complying with site safety and health requirements. Safety Meeting Documentation forms (Plate 2-A) will be used to document that site personnel have been apprised of site safety and health requirements.

ooOoo

3.0 GENERAL HEALTH AND SAFETY REQUIREMENTS

3.1 TRAINING

Health and Safety training is required for personnel assigned to work on the site or who may be expected to perform potentially hazardous activities.

Consistent with the Federal OSHA 29 CFR 1910.120 regulations covering Hazardous Waste Operations and Emergency Response, site personnel are required to be trained in accordance with the standard. At a minimum, personnel are required to be trained to recognize the hazards on site, the provisions of this HSP and the responsible personnel.

3.1.1 Preassignment Training

Prior to arrival on site, each employer shall be responsible for certifying that field personnel meet the requirements of preassignment training. Consistent with Federal OSHA 29 CFR 1910.120 each employer shall be able to provide a document certifying dates of 40 hours of training. An employer may also grandfather experienced personnel. Personnel must receive 8 hours of annual refresher training.

3.1.2 Site-Specific Training

Site personnel will complete site-specific training that will address potential hazards anticipated to be at the site and control measures to be implemented. This training will include the following:

- Health and Safety Plan - Site personnel will be instructed verbally on the contents of the plan.

- Hazard Awareness - Employees will be made aware of the chemicals used or suspected to have been used on site. Information will include potential routes of exposure, acute and/or chronic effects, protective clothing to be worn, precautionary measures to be taken, and specific task assignments.

- Safety meeting information will be recorded on Safety Meeting Documentation forms (Plate 2-A), which will be retained in project files.

3.1.3 First Aid and CPR Training

It is required that a selected number of field personnel including the SHSC shall have First-Aid and CPR training. These courses shall be consistent with the requirements of the American Red Cross Association. Only employees current in first-aid/CPR training are to render assistance to an injured employee.

3.2 MEDICAL PROGRAM

Medical monitoring programs are designed to track the physical condition of employees on a regular basis as well as to establish preemployment or baseline conditions prior to potential exposures. The medical surveillance program is part of each employer's Health and Safety Program.

3.2.1 Baseline or Preassignment and Periodic Monitoring

Prior to being assigned to a hazardous or potentially hazardous activity involving exposure to toxic materials, each site employee must have received a preassignment or baseline physical or an update physical within the last 12 months that complies with the Federal OSHA 29 CFR 1910.120 requirements. The specific contents of the physical is to be determined by the employer's medical consultant.

No additional testing for site specific contaminant health effects is required for this site.

3.2.2 Exposure/Injury/Medical Support

As a follow-up to an injury or possible exposure above established exposure limits, all employees are entitled to and encouraged to seek medical attention and physical testing. Depending upon the type of exposure, it is critical to perform follow-up testing within 24-48 hours. In the event of an injury, site personnel are to administer first-aid, as appropriate, transport the victim to the closest emergency care facility as identified on

Plate 1-A, or call 911 for assistance.

3.3 SITE SAFETY MEETINGS

Site Safety meetings will be conducted by the SSO before field personnel begin work, when there are modifications to the Health and Safety Plan, and when additional personnel begin field work. Meetings shall be attended by all field personnel involved in field activities.

The meeting topics shall include the following:

- Description of the assigned tasks and their potential hazards;
- Coordination of site activities;
- Physical and health hazards;
- Identification of methods and precautions to prevent injuries;
- Emergency planning;
- Modification to Health and Safety Plan;
- Input from field personnel on health and safety issues pertaining to site activities; and
- Collection of the attendees' signatures, acknowledging receipt and understanding of the Health and Safety Plan and their agreement to comply.

oo0oo

4.0 PHYSICAL AND CHEMICAL HAZARDS

The following section details the potential safety and hazards which may be encountered during the drilling project.

4.1 PHYSICAL HAZARDS

Anticipated physical hazards include exposure to noise from site equipment, heavy equipment and traffic hazards, vehicle use, heat stress from the use of personal protective equipment, and other hazards associated with any outdoor labors such as slips, trips, falls, splashes, spills, and material-handling (back) injuries. Caution will be exercised to avoid such hazards.

4.1.1 Heat Stress

The ambient air temperature is expected to be above 70°F; therefore, heat stress monitoring will be required.

Heat Stress Illnesses

- Heat stroke is a life threatening situation in which the victim's temperature control system, which produces sweating to cool body, stops working. Body temperature can rise quickly to levels that can cause brain damage and death. Immediate action is required.

- Heat exhaustion is less dangerous and results from loss of body fluids. This fluid loss causes blood flow to decrease in vital organs, resulting in a form of shock. In addition, sweat does not evaporate properly due to high humidity or layers of clothing, resulting in inadequate cooling of the body.

- Heat cramps are muscular spasms due to heavy exertion. These cramps usually involve the abdomen and legs and are caused by the loss of water and salt via heavy sweating.

- Heat rash is a skin rash that occurs from excessive moisture and chaffing clothes. Commonly referred to as "prickly rash".

Preventing heat stress is particularly important because once someone suffers from heat stroke or heat exhaustion, that person may be predisposed to additional heat injuries. The signs/symptoms and first-aid for heat related illnesses are summarized in Table 1.

Method of Controlling Heat Stress

Adequate shade in which employees can rest and drinking water (or electrolyte solution to prevent dehydration) must be available at the site. Employees are encouraged to drink plenty of fluids.

The following initial work schedule will be implemented:

Heat Stress Monitoring:

- Count the heart rate by the radial pulse for 1 minute for all personnel at the beginning of the day prior to start of activities.
- Work for 1 to 1½ hours.
- Break for 15 minutes.
- Count the radial pulse for all personnel for 30 seconds (and multiply by 2) at the beginning of the break period.
- If the heart rate exceeds 110 beats per minute (BPM), shorten the next work cycle by ⅓ and keep the rest periods at 15 minutes.
- If the heart rate exceeds 110 BPM at the next rest period, shorten the next work cycle by ⅓ again, keeping the 15 minute breaks.

- If the heart rate ever exceeds 120 BPM, the employee will be required to rest for 30 to 45 minutes to allow the heart rate to decrease to at least 90 BPM.

Forms of Heat Stress	Signs/Symptoms	First Aid
Heat Stroke	Hot, red skin Constricted (small) pupils High body temperature Unusually dry skin	Call EMS (911), care for shock. Immerse in cool water or wrap in wet towels. Give NOTHING by mouth.
Heat Exhaustion	Cool, pale, moist skin Heavy sweating Normal body temperature Dilated (large) pupils Headache, nausea, dizziness, vomiting	Move to cool area. Have victim lie down, elevating feet by 1 to 1½ feet. Loosen clothing. Apply wet towels, give glass of water every 15 minutes.
Heat Cramps	Muscular pain, aches that typically occur several hours after cessation of work/heat exposure	If cramps occur on-site move to cool place. Give glass of water every 15 minutes. Replace lost fluids/electrolytes as necessary if cramps occur off the site.

4.2 CHEMICAL HAZARDS

The principal hazard to site investigation personnel at the Campbell Soup Company/Napoleon Plant facility is potential exposure to petroleum naptha, cyclohexcanol, and isobutyl and amino alcohol. Potential hazards include toxicity due to inhalation and dermal contact of the various compounds present.

Chemical hazard information is summarized on the table presented on the following page.

CHEMICAL HEALTH HAZARD INFORMATION

Chemical / Compound	ACGIH TLVs		NIOSH	Routes of Entry	Target Organs	Acute Exposure Symptoms
	TWA	STEL	IDLH			
Mineral Spirits 135/ Petroleum Naptha	100 ppm	200 ppm	10,000 ppm	Inhalation, ingestion, skin contact, skin absorbtion	CNS, eyes, skin, respiratory system	Diziness, drownsiness, nausea; irratation of eyes, nose, throat
2 – Butoxy Ethanol	25 ppm	NA	700 ppm	Inhalation, ingestion, skin contact, skin contact, skin absorption	Eyes, skin respiratory stem	Eye, nose, skin, hemolysis
Cyclohexanol	50 ppm	50 ppm	3500 ppm	Inhalation, ingestion, skin contact, skin absorption	Eyes, skin, respiratory system	Irritated eyes, nose, skin; skin narcosis
Isobutyl Alcohol	50 ppm	50 ppm	8000 ppm	Inhalation, ingestion	Eyes, skin; respiratory system	Irritates eyes, skin; drowsiness stupor, dermatitis

4.2.1 Hazard Evaluation

Route of Exposure

Chemical contaminants may be a health hazard to site personnel via ingestion, skin absorption, or inhalation. Accidental ingestion of contaminants may occur as a result of dust or soil on the hands and hand to mouth contact or inhalation. Inhalation of vapor may occur during soil disruption activities, sample collection, and sample preparation. Skin absorption is possible if skin directly contacts site contaminants, contaminated soil or water.

4.3 LEVEL OF PROTECTION

For the described activities, personnel working at the site will initially be required to wear Level D protection. This protection will include the following:

- Coveralls
- Steel-toed boots
- Hard hat
- Disposable gloves during sample handling operations
- Eye protection, as necessary
- Ear protection, as necessary

Higher or lower levels of protective equipment may be required depending on hazard assessments and air monitoring readings during field work. The upgrade or downgrade of protective equipment will be recorded on the Field Activity Daily Log form.

If the PID steady state meter reading in the worker's breathing zone is 20 ppm or more, for one minute, then the SSO will authorize Level C protection.

Level C includes:

- Full face respirator NIOSH approved with organic vapor cartridges

- Tyvek suits (if splash hazard is possible, a polyethylene coated suit must be worn)
- Nitrile, butyl rubber, or neoprene gloves
- Steel toe/shank chemically resistant rubber or neoprene work boot, or steel toe/shank work boot with chemically resistant outer boots
- Inner disposable gloves (two pairs recommended)
- Hard hat
- Hearing protection (as appropriate)

If the PID steady state meter reading is over 250 ppm for one minute, then work will stop until Level B protection can be used.

Level B includes:

- Air supplied respirator
- Coated Tyvek suit, such as Saranex
- Nitrile, butyl rubber, or neoprene gloves
- Inner latex or vinyl gloves
- Steel toe and shank boots
- Outer boots - chemically resistant, rubber or neoprene
- Hard hat
- Hearing protection (as appropriate)

ooOoo

5.0 SITE SAFETY WORK PLAN

5.1 SITE ENTRY PROCEDURES

It will be necessary for the field team to control access to the work area. The SSO will mark a restricted area, using traffic delineators (cones) and highly visible tape. Only persons who meet the safety training and medical monitoring requirements and who are in possession of the required personal protective equipment will be allowed in the restricted area. Prior to the start of field work activities, the SSO will perform the following steps as necessary:

- Sign in with facility representative and inform him of each day's planned activities.
- Locate the nearest telephone and post the emergency telephone numbers.
- Identify the locations of the fire extinguisher, emergency eye wash, first aid kit, restrooms, and rest areas.
- Flagging and barricades will be placed to prohibit entry of all unauthorized personnel to the work area/Exclusion Zone.
- Setup support zone, decontamination zone, and the up-site access point.
- Evaluate site conditions.

5.2 AIR MONITORING REQUIREMENTS

Monitoring for volatile organic compounds (VOCs) will be conducted using an photoionization detector (PID) which will be calibrated prior to use in accordance to the manufacturer's instructions. Calibration shall be recorded in the calibration log. Monitoring for combustible atmospheres will be conducted during drilling activities using either a combustible gas indicator (CGI) or the PID. VOCs will be monitored in the breathing zone of the workers. Combustible atmospheres will be monitored in low lying areas, excavations, sumps or pits, near the boring locations, and in other areas as dictated by site conditions.

5.2.1 Action Levels

Action levels for area air monitoring are as follows:

- VOC - 20 parts per million (ppm); PPE upgraded to Level C
- VOC - 250 ppm; PPE upgraded to Level B
- Combustibles - 20% of lower explosive limit (LEL) or >2,800 ppm OVA/PID reading; forced ventilation and grounding will be implemented.
- Combustibles - >20% of the LEL or >2,800 ppm PID/OVA; shut down equipment and evacuate site until forced ventilation or ambient aeration reduce levels.

If the action level is equaled or exceeded, work will stop immediately and personnel will move upwind and let the area vent for at least 5 minutes. At the end of the 5-minute waiting period, air quality measurements will be taken. If concentrations have not decreased to below the action level, the level of protection, combustible control measures and work procedures will be revaluated. Air-purifying respirators will be required if VOC levels above 20 ppm are measured in the worker breathing zone, and air-supplied respirators will be required of VOC levels exceed 250 ppm, as discussed in Section 4.3.

If the measured concentrations continue to exceed the action levels, the level of protection necessary for personnel and combustible control measures will be reevaluated. In extreme cases, a particular operation may be delayed and restarted under new working safety guidelines or may be abandoned completely.

5.3 WORK LIMITATIONS

Work limitations include the following:

- No eating, drinking, or smoking will be permitted in the field operation area.
- Contact lenses will not be worn in the field operation area.
- Facial hair that could interfere with respirator fit will not be permitted.

- The buddy system will be used at all times.
- Work will be done during the daylight hours only.
- Site activities will not be conducted during lightning storms.

5.4 DECONTAMINATION PROCEDURES

The site safety coordinator is responsible for ensuring that all pieces of equipment are properly decontaminated according to the procedures outlined above. Decontamination must be documented in the Field Daily Activity Logs.

5.4.1 Decontamination Area

Set decontamination area upwind and upgradient of the work area, as necessary. The decontamination area must be established at a sufficient distance from the drilling locations to preclude contamination by splashing water or flying dirt.

5.4.2 Personnel

Wash outer gloves and boots with soap and water. Remove and dispose of Tyvek suit or cotton coveralls, as applicable. Remove boots and then outer gloves. Remove respirator and finally remove inner gloves. Wash hands and face with soap and water, and dispose of Tyvek in drums. Containerize rinsate on-site for proper disposal. Take a shower and wash hair as soon as possible after leaving the site.

5.4.3 Equipment Decontamination

Drilling rig, drilling and sampling tools and air monitoring instruments will be cleaned before transport to the non-contaminated work area. The equipment decontamination procedures are described in the work plan.

5.4.4 Disposal of Materials Used On Site

Solid and liquid wastes generated during decontamination procedures and disposable personal protective equipment will be packed in 55-gallon reconditioned drums, and shall be contained in a secure area and will be inventoried and labeled. After analytical results determine whether soil or water is contaminated, the drums will be disposed of in an appropriate manner.

ooOoo

6.0 EMERGENCY RESPONSE CONTINGENCY PROCEDURES

In the event of a catastrophe (fire, explosion, chemical release) or severe (life-threatening) medical emergency, emergency actions will be implemented by qualified field personnel. Appropriate response actions to be taken by field personnel involved in the emergency include the alerting of site individuals of the emergency situation; evacuate the site; stopping the release, if possible; requesting outside assistance, as necessary; and extinguishing small fires, if safe to do so; rendering first-aid; notifying local authorities; and transporting injured persons, if appropriate.

6.1 EMERGENCY INFORMATION

Emergency Phone Numbers:

Ambulance 911
Hospital Emergency Care 911
Poison Control Center 911
Police 911
CHEMTREC 1-800-424-9300
TSCA Hotline 202-541-1404
National Response Center 1-800-424-8802
Pesticide Information Center 1-800-845-7633
EPA ERT Emergency 201-321-6660
RCRA Hotline 1-800-424-9346
Bureau of Explosives 202-835-9500
Henry County Hospital 419-592-4015

Henry County Hospital
11-600 State Route 424
Napoleon, Ohio (See Plate 1-A)

Responsible Personnel:

Team Members	Responsibility	Phone No.
James DeLano	Field Supervisor/Site Safety Officer	(606) 371-2960
Dan Elliott	Project Manager/ Site Health & Safety Coordinator	(213) 889-5300
Nancy Newlander	Health and Safety Consultant	(213) 889-5300

6.2 PERSONNEL INJURY

The following steps will be taken if an injury occurs:

- Prevent further injury and notify the SSO.
- Initiate first aid and provide immediate medical attention for the injured person.
- Depending on the type and severity of the injury, call 911 or transport victim to nearest emergency medical facility.
- Notify the injured person's supervisor or personnel office.
- Prepare an injury incident report. The Project Manager is responsible for preparing and submitting the incident report to the Health and Safety Officer, the Manager, and the Corporate Personnel Office within 48 hours.

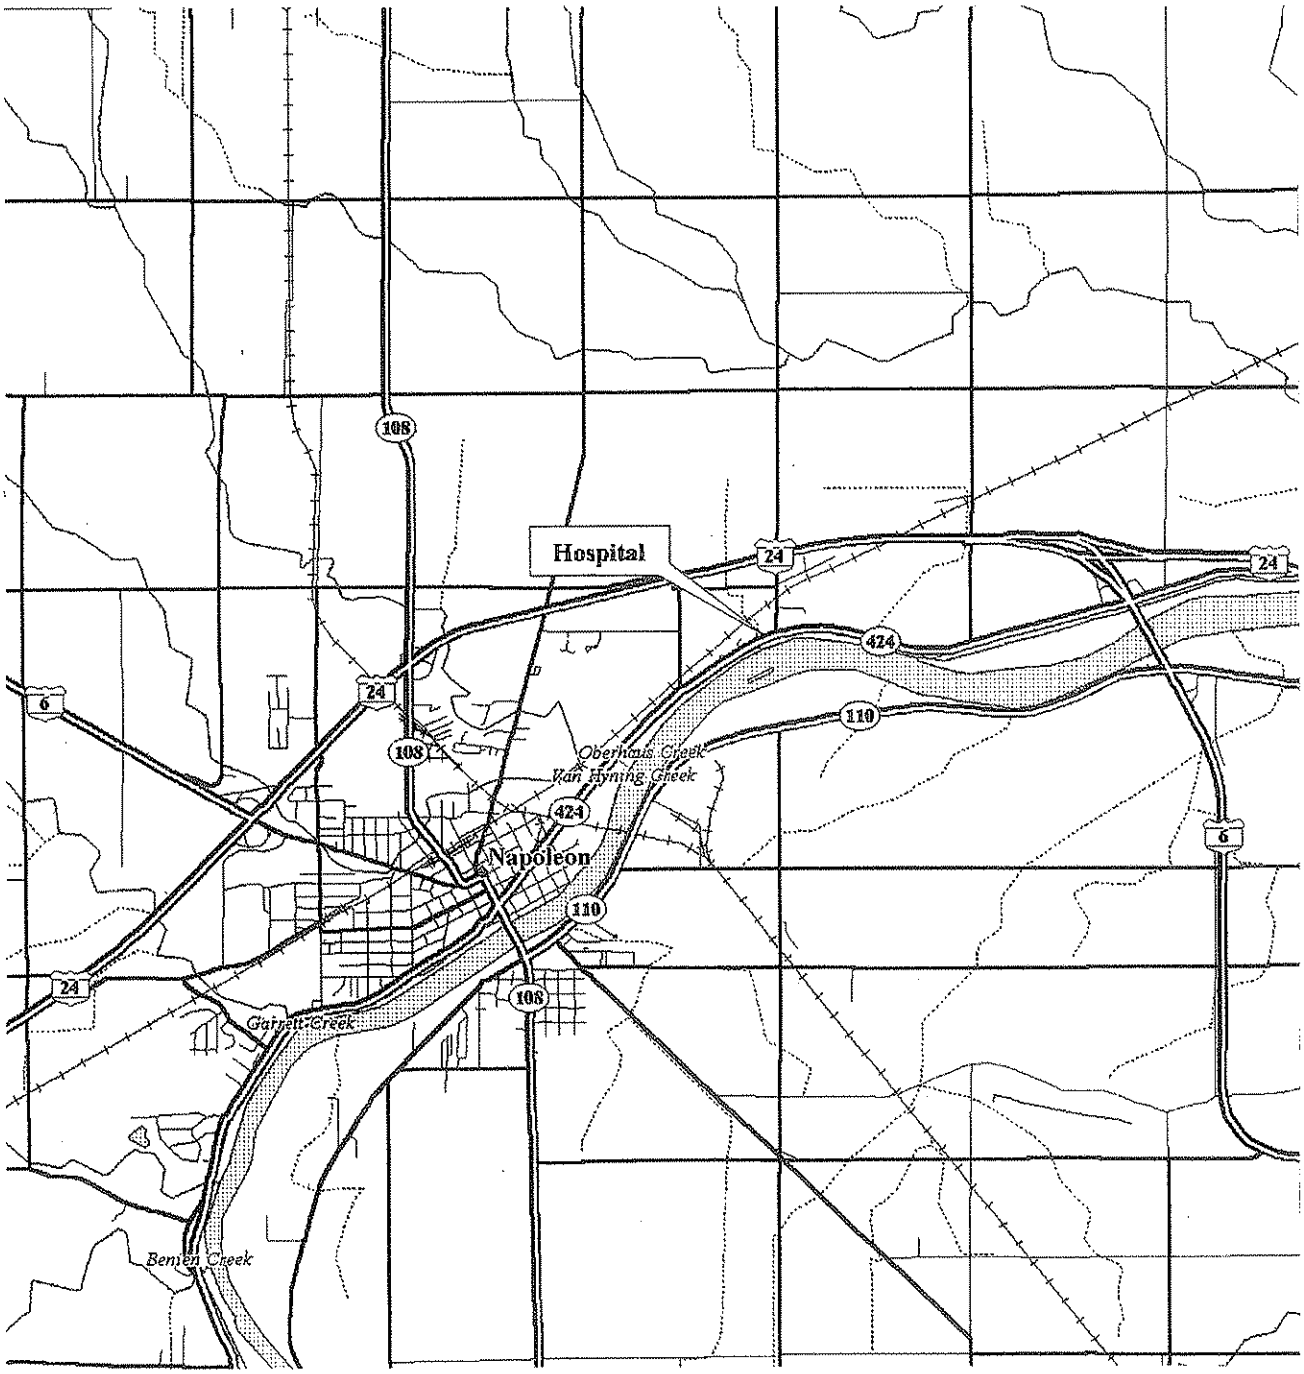
6.2.1 Small Fire/Explosion

In the event of a small, controlled, explosion or fire, the field supervisor will determine if fire suppression can be achieved by site personnel. Only trained, qualified personnel will be used. Appropriate actions include:

- Notify site personnel to leave work zone.
- Use of heavy equipment to smother flames with clean site soil or clean fill, if readily available.

- Use of fire extinguishers.
- Use of clean decontamination water.
- Evacuate work zone or fire area, call facility emergency number, as required.
- Evacuate work zone or fire area, call 911.
- Stay at the site while waiting for Fire Department as long as it is safe to do so.
- Notify Project Manager, Health and Safety Officer, or Department Manager.
- Determine with appropriate facility, Fire Department personnel ability to continue work.
- Notify site personnel of decision to continue work or to stop work.

6.2.2 Large Fire/Explosion



In the event of an uncontrolled or large fire or explosion, the field supervisor will:

- Immediately sound evacuation alarm.
- Call 911, or facility emergency number.
- Take head count.
- Move personnel off site to wait for Fire Department.
- Notify Project Manager, Branch Manager, or Health and Safety Officer.
- Determine, in conjunction with facility personnel and Project Manager, whether to send home site personnel.
- Remain at location, if necessary for fire department or facility investigation.

6.3 EMERGENCY SIGNALS

EQUIPMENT	SIGNAL	REQUIRED ACTION
Air Horn	1 long blast 10 seconds apart	Stop work, turn off equipment, leave work zone, use modified decon procedures, assemble in support zone
Air Horn	3 short successive blasts 10 seconds between each set	Immediately stop work, turn off equipment and evacuate site; assemble in alternate area as indicated in tailgate meetings

Section II—HAZARDOUS INGREDIENTS

INGREDIENTS	C.A.S. NUMBER	WT. PERCENT	EXPOSURE LIMITS-TWA TLV	PEL	VAPOR PRESSURE
2-BUTOXY ETHANOL	111-76-2	24	25PPM SKIN	25PPM	0.6
CYCLOHEXANOL	108-93-0	10	50PPM	50PPM	1.0
ISOBUTYL ALCOHOL	78-83-1	<5	50PPM	100PPM	9.6
AMINO ALCOHOL	108-01-0	<5	NOT ESTABLISHED		5.0

THIS PRODUCT CONTAINS THE FOLLOWING SUBSTANCES WHICH ARE DEFINED AS TOXIC UNDER SECTION 313 OF SARA TITLE III and 40 CFR 372: GLYCOL ETHER (2-BUTOXY ETHANOL).

No F-020
F-021
F-022
F-023
F-026
F-027

Section III—PHYSICAL DATA

BOILING RANGE (°F): 320-340 VAPOR DENSITY: [YY] HEAVIER [ ] LIGHTER THAN AIR

EVAPORATION RATE: [ ] FASTER [YY] SLOWER THAN ETHER PERCENT VOLATILE BY VOLUME: 44 WEIGHT PER GALLON: 8.25

Section IV—FIRE AND EXPLOSION HAZARD DATA

FLAMMABILITY CLASSIFICATION: COMBUSTIBLE OSHA Class II FLASH POINT (SETAFLASH): 122 °F LEL 1.1

EXTINGUISHING MEDIA: Carbon dioxide, dry chemical, foam.

UNUSUAL FIRE AND EXPLOSION HAZARDS: Keep containers tightly closed. Avoid sources of ignition. Ground all transfer equipment. Closed containers may explode when exposed to extreme heat.

SPECIAL FIRE FIGHTING PROCEDURES: Water spray (fog nozzles) may be used for cooling closed containers. Full protective equipment should be used by firefighters to protect them from hazardous decomposition products listed in Section VI.

MSDS - B

Section V—HEALTH HAZARD DATA

THESHOLD LIMIT VALUE: SEE SECTION II

EFFECTS OF OVEREXPOSURE: ACUTE

EYES - Can cause severe irritation, tearing, blurred vision.

SKIN - Prolonged or repeated contact can cause moderate irritation, drying, defatting, dermatitis. Toxic if absorbed through the skin.

INHALATION - Excessive inhalation of vapors can cause nasal and respiratory irritation, dizziness, weakness, fatigue, nausea, headache, possible unconsciousness and asphyxiation.

INGESTION - Can cause gastrointestinal irritation, nausea, vomiting and diarrhea.

EFFECTS OF OVEREXPOSURE: CHRONIC

Prolonged and repeated overexposure may cause anemia, liver abnormalities, kidney damage, lung damage, blood abnormalities.

AGGRAVATED MEDICAL CONDITIONS:

Pre-existing skin, eye, lung, kidney, blood and liver disorders may be aggravated by exposure.

PRIMARY ROUTES OF ENTRY:

Inhalation, skin contact and absorption.

EMERGENCY AND FIRST AID PROCEDURES: In case of skin contact, wash thoroughly with soap and water: for eyes, flush immediately with plenty of water for 15 minutes and call a physician. Remove and wash contaminated clothing before reuse. If exposed to high concentration of vapor remove patient to fresh air. If swallowed, CALL A PHYSICIAN IMMEDIATELY. DO NOT INDUCE VOMITING.

Section VI—REACTIVITY DATA

STABILITY: [ ] UNSTABLE [X] STABLE

INCOMPATIBILITY (Materials to avoid): Strong oxidizing agents.

HAZARDOUS DECOMPOSITION PRODUCTS: As with any organic chemical, thermal decomposition will yield carbon dioxide and probably carbon monoxide.

HAZARDOUS POLYMERIZATION [ ] MAY OCCUR [X] WILL NOT OCCUR

CONDITIONS TO AVOID: Sources of ignition, high temperatures.

Section VII—SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED: Remove sources of ignition, ventilate and remove with inert absorbent.

WASTE DISPOSAL METHOD: Incinerate in approved facility in accordance with local, state and federal regulations. Do not incinerate closed container.

Section VIII—SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION: Use NOISH approved respiratory device when airborne exposure limits are exceeded. Provide ventilation to control exposure levels below airborne exposure limits.

VENTILATION: All application areas should be ventilated in accordance with OSHA regulations.

PROTECTIVE GLOVES: Recommended.

EYE PROTECTION: Use approved safety eyewear with splash guards.

OTHER PROTECTIVE EQUIPMENT: Safety shower and eye bath.

Section IX—SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORING: Keep away from heat, sparks and open flame Use only with adequate ventilation. Since emptied containers retain product residue (vapor or liquid), all labeled hazard precautions must be observed.

OTHER PRECAUTIONS: Avoid prolonged or repeated breathing of vapor or spray mist. Avoid contact with eyes and skin. Do not take internally.

The information contained herein is furnished without warranty of any kind. Employers should use this information only as a supplement to other information gathered by them and must make independent determinations of suitability and completeness of information from all sources to assure proper use of these materials and the safety and health of employees.

*BASED UPON TESTING OF EITHER PRODUCT OR ESSENTIALLY SIMILAR PRODUCTS.

SECTION III HEALTH INFORMATION

THE HEALTH EFFECTS NOTED BELOW ARE CONSISTENT WITH REQUIREMENTS UNDER THE OSHA HAZARD COMMUNICATION STANDARD (29 CFR 1910.1200).

EYE CONTACT
LIQUID IS MINIMALLY IRRITATING TO THE EYES. HIGH VAPOR CONCENTRATIONS MAY CAUSE IRRITATION.

SKIN CONTACT
LIQUID IS SLIGHTLY IRRITATING TO THE SKIN. PROLONGED OR REPEATED LIQUID CONTACT CAN RESULT IN DEFATTING AND DRYING OF THE SKIN WHICH MAY RESULT IN SKIN IRRITATION AND DERMATITIS.

PRODUCT NAME; MINERAL SPIRITS 135

HALATION
PORS MAY BE IRRITATING TO NOSE, THROAT AND RESPIRATORY TRACT. HIGH VAPOR CONCENTRATIONS MAY CAUSE CNS DEPRESSION.

GESTION
GESTION OF PRODUCT MAY RESULT IN VOMITING; ASPIRATION (BREATHING) OF VOMITUS INTO THE LUNGS MUST BE AVOIDED AS EVEN SMALL QUANTITIES MAY RESULT IN ASPIRATION PNEUMONITIS.

GNS AND SYMPTOMS
RITATION AS NOTED ABOVE. EARLY TO MODERATE CNS (CENTRAL NERVOUS SYSTEM) DEPRESSION MAY BE IDENCED BY GIDDINESS, HEADACHE, DIZZINESS AND NAUSEA; IN EXTREME CASES, UNCONCIOUSNESS AND DEATH AY OCCUR. ASPIRATION PNEUMONITIS MAY BE EVIDENCED BY COUGHING, LABORED BREATHING AND CYANOSIS BLUISH SKIN); IN SEVERE CASES DEATH MAY OCCUR.

GRAVATED MEDICAL CONDITIONS
EEXISTING EYE, SKIN AND RESPIRATORY DISORDERS MAY BE AGGRAVATED BY EXPOSURE TO THIS PRODUCT.

E SECTION VI FOR SUPPLEMENTAL INFORMATION.

	OSHA		ACGIH		OTHER
IU.	PEL/TWA	PEL/CEILING	TLV/TWA	TLV/STEL	
	500 PPM		100 PPM	200 PPM	

ECOMMEND THAT LIMITS FOR STODDARD SOLVENT BE USED AS A GUIDE.

CTION V EMERGENCY AND FIRST AID PROCEDURES

YE CONTACT
SH EYES WITH PLENTY OF WATER FOR 15 MINUTES WHILE HOLDING EYELIDS OPEN. GET MEDICAL ATTENTION.

IN CONTACT
EMOVE CONTAMINATED CLOTHING/SHOES. FLUSH SKIN WITH WATER. FOLLOW BY WASHING WITH SOAP AND WATER. IF IRRITATION OCCURS, GET MEDICAL ATTENTION. DO NOT REUSE CLOTHING UNTIL CLEANED.

ALATION
EMOVE VICTIM TO FRESH AIR AND PROVIDE OXYGEN IF BREATHING IS DIFFICULT. GIVE ARTIFICIAL ESPIRATION IF NOT BREATHING. GET MEDICAL ATTENTION.

ESTION
NOT INDUCE VOMITING. IF VOMITING OCCURS SPONTANEOUSLY, KEEP HEAD BELOW HIPS TO PREVENT SPIRATION OF LIQUID INTO THE LUNGS. GET MEDICAL ATTENTION.

E TO PHYSICIAN
.. MORE THAN 2.0 ML PER KG HAS BEEN INGESTED AND VOMITING HAS NOT OCCURRED, EMESIS SHOULD BE NOUCED WITH SUPERVISION. KEEP VICTIM'S HEAD BELOW HIPS TO PREVENT ASPIRATION. IF SYMPTOMS SUCH S LOSS OF GAG REFLEX, CONVULSIONS OR UNCONSCIOUSNESS OCCUR BEFORE EMESIS, GASTRIC LAVAGE USING A FED ENDOTRACHEAL TUBE SHOULD BE CONSIDERED.

TION VI SUPPLEMENTAL HEALTH INFORMATION

ALE RATS EXPOSED FOR 90 DAYS BY INHALATION TO VAPORS OF SOLVENTS SIMILAR TO COMPONENT 1 SHOWED VIDENCE OF KIDNEY DAMAGE. THE RELEVANCE OF THIS EFFECT TO MAN IS UNKNOWN. IN ONE OF THE STUDIES OW GRADE ANEMIA WAS ALSO OBSERVED.

S EXPOSED FOR 4 MONTHS TO 1700 PPM OF A SOLVENT SIMILAR TO COMPONENT 2 SHOWED EVIDENCE OF MILD AMAGE TO THE LIVER, LUNGS AND KIDNEYS. THESE EFFECTS WERE NOT SEEN IN RATS EXPOSED FOR ONE YEAR 350 PPM OF ANOTHER SIMILAR SOLVENT. RATS EXPOSED TO VAPORS OF A SIMILAR SOLVENT DURING GNANCY SHOWED EMBRYO/FETOTOXICITY AT CONCENTRATIONS PRODUCING MATERNAL TOXICITY.

PRODUCT NAME: MINERAL SPIRITS 135

SECTION VII PHYSICAL DATA

BOILING POINT: 330-390 (DEG F)

SPECIFIC GRAVITY: 0.79 (H2O=1)

VAPOR PRESSURE: 16*@100 DEG. F (MM HG)

MELTING POINT: NOT AVAILABLE (DEG F)

SOLUBILITY: NEGLIGIBLE (IN WATER)

VAPOR DENSITY: 4.8* (AIR=1)

EVAPORATION RATE (N-BUTYL ACETATE = 1): <0.1*

*ESTIMATED

APPEARANCE AND ODOR:
LIGHT COLORED LIQUID. HYDROCARBON ODOR.

SECTION VIII FIRE AND EXPLOSION HAZARDS

FLASH POINT AND METHOD:
114 DEG. F (TCC)

FLAMMABLE LIMITS /% VOLUME IN AIR
LOWER: 1 UPPER: 6

EXTINGUISHING MEDIA
USE WATER FOG, FOAM, DRY CHEMICAL OR CO2. DO NOT USE A DIRECT STREAM OF WATER. PRODUCT WILL FLOAT AND CAN BE REIGNITED ON SUFACE OF WATER.

SPECIAL FIRE FIGHTING PROCEDURES AND PRECAUTIONS
CAUTION. COMBUSTIBLE. DO NOT ENTER CONFINED FIRE SPACE WITHOUT FULL BUNKER GEAR (HELMET WITH FACE SHIELD, BUNKER COATS, GLOVES AND RUBBER BOOTS), INCLUDING A POSITIVE PRESSURE NIOSH APPROVED SELF-CONTAINED BREATHING APPARATUS. COOL FIRE EXPOSED CONTAINERS WITH WATER.

UNUSUAL FIRE AND EXPLOSION HAZARDS
CONTAINERS EXPOSED TO INTENSE HEAT FROM FIRES SHOULD BE COOLED WITH WATER TO PREVENT VAPOR PRESSURE BUILDUP WHICH COULD RESULT IN CONTAINER RUPTURE. CONTAINER AREAS EXPOSED TO DIRECT FLAME CONTACT SHOULD BE COOLED WITH LARGE QUANTITIES OF WATER AS NEEDED TO PREVENT WEAKENING OF CONTAINER STRUCTURE.

SECTION IX REACTIVITY

STABILITY: STABLE

HAZARDOUS POLYMERIZATION: WILL NOT OCCUR

CONDITIONS AND MATERIALS TO AVOID:
AVOID HEAT, FLAME AND CONTACT WITH STRONG OXIDIZING AGENTS.

HAZARDOUS DECOMPOSITION PRODUCTS
CARBON MONOXIDE AND UNIDENTIFIED ORGANIC COMPOUNDS MAY BE FORMED DURING COMBUSTION.

SECTION X EMPLOYEE PROTECTION

RESPIRATORY PROTECTION
AVOID PROLONGED OR REPEATED BREATHING OF VAPORS. IF EXPOSURE MAY OR DOES EXCEED OCCUPATIONAL EXPOSURE LIMITS (SEC. IV) USE A NIOSH-APPROVED RESPIRATOR TO PREVENT OVEREXPOSURE. IN ACCORD WITH 29 CFR 1910.134 USE EITHER AN ATMOSPHERE-SUPPLYING RESPIRATOR OR AN AIR-PURIFYING RESPIRATOR FOR ORGANIC VAPORS.

PROTECTIVE CLOTHING
AVOID CONTACT WITH EYES. WEAR SAFETY GLASSES OR GOGGLES AS APPROPRIATE. AVOID PROLONGED OR REPEATED CONTACT WITH SKIN. WEAR CHEMICAL-RESISTANT GLOVES AND OTHER CLOTHING AS REQUIRED TO MINIMIZE CONTACT.

DDITIONAL PROTECTIVE MEASURES
USE EXPLOSION-PRDOF VENTILATION AS REQUIRED TO CONTROL VAPOR CONCENTRATIONS. AIR-DRY CONTAMINATED CLOTHING IN A WELL VENTILATED AREA. THEN Llaunder BEFORE REUSING.

SECTION XI ENVIRONMENTAL PROTECTION

PILL OR LEAK PROCEDURES
CAUTION. COMBUSTIBLE. *** LARGE SPILLS *** ELIMINATE POTENTIAL SOURCES OF IGNITION. WEAR APPROPRIATE RESPIRATOR AND OTHER PROTECTIVE CLOTHING. SHUT OFF SOURCE OF LEAK ONLY IF SAFE TO DO SO. DIKE AND CONTAIN. REMOVE WITH VACUUM TRUCKS OR PUMP TO STORAGE/SALVAGE VESSELS. SOAK UP RESIDUE WITH AN ABSORBENT SUCH AS CLAY, SAND, OR OTHER SUITABLE MATERIAL; PLACE IN NON-LEAKING CONTAINERS AND SEAL TIGHTLY FOR PROPER DISPOSAL. FLUSH AREA WITH WATER TO REMOVE TRACE RESIDUE; DISPOSE OF FLUSH SOLUTION AS ABOVE. *** SMALL SPILLS *** TAKE UP WITH AN ABSORBENT MATERIAL AND PLACE IN NON-LEAKING CONTAINERS FOR PROPER DISPOSAL.

SECTION XII SPECIAL PRECAUTIONS

EEP LIQUID AND VAPOR AWAY FROM HEAT, SPARKS AND FLAME. SURFACES THAT ARE SUFFICIENTLY HOT MAY IGNITE EVEN LIQUID PRODUCT IN THE ABSENCE OF SPARKS OR FLAME. EXTINGUISH PILOT LIGHTS, CIGARETTES AND TURN OFF OTHER SOURCES OF IGNITION PRIOR TO USE AND UNTIL ALL VAPORS ARE GONE. VAPORS MAY ACCUMULATE AND TRAVEL TO IGNITION SOURCES DISTANT FROM THE HANDLING SITE; FLASH-FIRE CAN RESULT. EEP CONTAINERS CLOSED WHEN NOT IN USE. USE WITH ADEQUATE VENTILATION.

CONTAINERS, EVEN THOSE THAT HAVE BEEN EMPTIED, CAN CONTAIN EXPLOSIVE VAPORS. DO NOT CUT, DRILL, GRIND, WELD OR PERFORM SIMILAR OPERATIONS ON OR NEAR CONTAINERS.

ATIC ELECTRICITY MAY ACCUMULATE AND CREATE A FIRE HAZARD. GROUND FIXED EQUIPMENT. BOND AND GROUND TRANSFER CONTAINERS AND EQUIPMENT.

SECTION XIII TRANSPORTATION REQUIREMENTS

PARTMENT OF TRANSPORTATION CLASSIFICATION:
OMBUSTIBLE LIQUID

O.T. PROPER SHIPPING NAME:
TROLEUM NAPHTHA

THER REQUIREMENTS:
1255. GUIDE SHEET 27.

CTION XIV OTHER REGULATORY CONTROLS

OMPONENT #2 IS THE SUBJECT OF A TSCA SECTION 4 TEST RULE. EXPORT OF THIS PRODUCT IS THEREFORE ROHIBITED WITHOUT NOTIFICATION TO EPA. THE COMPONENTS OF THIS PRODUCT ARE LISTED ON THE EPA/TSCA VENTORY OF CHEMICAL SUBSTANCES.

ECTION XV SPECIAL NOTES

CTION XI - ENVIRONMENTAL PROTECTION HAS BEEN REVISED. THE INFORMATION IN THE "WASTE DISPOSAL" ND "ENVIRONMENT PROTECTION" HAS BEEN REMOVED AND INCLUDED IN THE ATTACHED ENVIRONMENTAL DATA HEET. IN ACCORDANCE WITH SARA TITLE III, SECTION 313, THE EOS SHOULD ALWAYS BE COPIED AND SENT TH THE MSDS.

9. Legal Owner (Continued) Address	**Street or P. O. Box:** P.O. Box 311	
	City, Town, or Village: Napoleon	
	State: OH	
	Country: Henry	**Zip Code:** 43545

10. Type of Regulated Waste Activity
Mark "Yes" or "No" for all activities; complete any additional boxes as instructed. (See instructions on pages 17 to 20.)

A. Hazardous Waste Activities
Complete all parts for 1 through 6.

Y☑ N☐ **1. Generator of Hazardous Waste**
If "Yes", choose only one of the following - a, b, or c.

- ☐ a. LQG: Greater than 1,000 kg/mo (2,200 lbs./mo.) of non-acute hazardous waste; or
- ☐ b. SQG: 100 to 1,000 kg/mo (220 - 2,200 lbs./mo.) of non-acute hazardous waste; or
- ☑ c. CESQG: Less than 100 kg/mo (220 lbs./mo.) of non-acute hazardous waste

In addition, indicate other generator activities.

Y☐ N☑ d. United States Importer of Hazardous Waste

Y☐ N☑ e. Mixed Waste (hazardous and radioactive) Generator

Y☐ N☑ **2. Transporter of Hazardous Waste**

Y☐ N☑ **3. Treater, Storer, or Disposer of Hazardous Waste (at your site)** Note: A hazardous waste permit is required for this activity.

Y☐ N☑ **4. Recycler of Hazardous Waste (at your site)**

Y☐ N☑ **5. Exempt Boiler and/or Industrial Furnace**
If "Yes", mark each that applies.
- ☐ a. Small Quantity On-site Burner Exemption
- ☐ b. Smelting, Melting, and Refining

Y☐ N☑ **6. Underground Injection Control**

B. Universal Waste Activities

Y☐ N☑ **1. Large Quantity Handler of Universal Waste (accumulate 5,000 kg or more) [refer to your State regulations to determine what is regulated]. Indicate types of universal mark all boxes that apply:**

	Manage
a. Batteries	☐
b. Pesticides	☐
c. Mercury containing equipment	☐
d. Lamps	☐
e. Other (specify)	☐
f. Other (specify) _____	☐
g. Other (specify) _____	☐

Y☐ N☑ **2. Destination Facility for Universal Waste**
Note: A hazardous waste permit may be required for this activity.

C. Used Oil Activities
Mark all boxes that apply.

Y☐ N☑ **1. Used Oil Transporter**
If "Yes", mark each that applies.
- ☐ a. Transporter
- ☐ b. Transfer Facility

Y☐ N☑ **2. Used Oil Processor and/or Re-refiner**
If "Yes", mark each that applies.
- ☐ a. Processor
- ☐ b. Re-refiner

Y☐ N☑ **3. Off-Specification Used Oil Burner**

Y☐ N☑ **4. Used Oil Fuel Marketer**
If "Yes", mark each that applies.
- ☐ a. Marketer Who Directs Shipment of Off-Specification Used Oil to Off-Specification Used Oil Burner
- ☐ b. Marketer Who First Claims the Used Oil Meets the Specifications

11. Description of Hazardous Wastes (See instructions on page 21.)

A. Waste Codes for Federally Regulated Hazardous Wastes. Please list the waste codes of the Federal hazardous wastes handled at your site. List them in the order they are presented in the regulations (e.g., D001, D003, F007, U112). Use an additional page if more spaces are needed.

D001	D035	F002	F003			

B. Waste Codes for State-Regulated (i.e., non-Federal) Hazardous Wastes. Please list the waste codes of the State-regulated hazardous wastes handled at your site. List them in the order they are presented in the regulations. Use an additional page if more spaces are needed for waste codes.

12. Comments (See instructions on page 21.)

Change from SQG to CESQG

13. Certification. I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.
For the RCRA Hazardous Waste Part A Permit Application, all operator(s) and owner(s) must sign (see 40 CFR 270.10 (b) and 270.11).
(See instructions on page 21.)

Re: Corrective Action Site Visit of August 11, 2008
OHD 987 046 703, V-8 Beverage Plant, 12-995 State Route 110
OHD 987 023 678, Chemical Residue Analytical Lab, P-152 County Road 12

Dear Mr. Sans:

On August 11, 2008, Ohio EPA met with Campbell Soup Supply Co. (CSS) to discuss RCRA Corrective Action and tour the facility to identify units that may be subject to corrective action. CSS was represented by Geoff Sans, Manager, Services & Utilities; Jim Koskan, Area Manager Services & Utilities, and Mike Maringer, consultant and former employee. Ohio EPA was represented by Dawn Pleiman and Michael Terpinski. The meeting commenced with a discussion of the other two Campbell Soup properties identified by Ohio EPA as being subject to RCRA corrective action, the V-8 Beverage Plant and the Chemical Residue Analytical Lab.

Discussions between both parties determined that although the Beverage Plant and Chemical Residue Analytical Lab were included in a 1994 letter which cited CSS for unpermitted storage and treatment of hazardous wastes in a (coal) waste pile prior to burning in an on-site boiler: the waste pile was located on the Main Plant's property. When soil beneath the waste pile was sampled in 1994 and found to have not negatively impacted the soil, the violation was abated by Ohio EPA.

In March of 2000, it was brought to Ohio EPA's attention that waste coating material used by CSS on steel cans as a rust inhibitor was stored on-site from 1980 to 1981. From roughly 1981 to 1993 the liquid phase of the waste in the drums was either burned directly in Campbell's boilers or poured onto a coal pile and then burned in the boilers. The semi-solid waste in the drums was placed in clay-lined pits and in 1983 the material was mixed with sand prior to excavation and disposal at a landfill. All three CSS Napoleon facilities were cited with an ORC 3734.02(E) violation for unpermitted treatment, storage and disposal (in a May 16, 2000, Ohio EPA correspondence).

Since all of the violations occurred on the Main Plant's property, the corrective action site visit only needed to focus on the Main Plant. Ohio EPA also concluded that the Beverage Plant and the Chemical Residue Lab should be removed from Ohio EPA's list of facilities subject to RCRA Corrective Action. Therefore, with this letter, Ohio EPA wishes to correct any errors in the Agency's records and U.S. EPA's RCRA Info database. In summary, the V-8 Beverage Plant, located at 12-995 State Route 110, and the Chemical Lab, located at P-152 County Road 12, in Napoleon Ohio were not treatment, storage or disposal facilities, and **are not subject to the RCRA Corrective Action requirements under Ohio law** as a result of the Ohio Revised Code 3734.02(E)(F) violations cited in Ohio EPA Notice Of Violation letters dated April 26, 1994 and May 16, 2000.

The Main Plant (OHD 005 419 171) remains subject to RCRA Corrective Action and is addressed in a separate correspondence.

If you have any questions on this correspondence, please do not hesitate to contact me at (419) 373-3148.

Sincerely,

Dawn Pleiman

Re: Henry County, Campbell Soup Company, Hazardous Waste Notice of Violation, OHD 987046703, OHD 987023678, and OHD 005419171.

Dear Mr. Michael R. Terpinski:

This is in response to the notice of violation letter dated May 16, 2000. The following is our response and further explanation of the events that took place involving the temporary holding pit area.

Spent solvent from the former can manufacturing operations at the Napoleon Plant was stored in 55-gallon drums and eventually used as a boiler fuel supplement (Boiler and Industrial Furnace 'BIF' Small Quantity Burner Exemption). Over time solids accumulated in the drums made it difficult to handle. To alleviate the solids, two earth dikes were constructed using a natural clay liner and compacted. The overall dimensions totaled approximately 20 feet wide by 35 feet long, with a depth of 2 ½ feet.

This practice was discontinued and the partially filled dikes were decommissioned in 1983. A local contractor using sand and natural soil excavated the dikes and hauled the material to the Evergreen Landfill for disposal. The material was analyzed by Evergreen at the landfill for disposal.

The earthen dikes were a one-time construction to remove semi-liquid solids from the drums. The practice was discontinued in 1983 with the excavation of the dikes.

We became aware of this practice, as we indicated in our March 23rd, 2000 meeting with you, and we immediately conducted an assessment of the area that resulted in the report we submitted to you.

Campbell Soup plans to conduct a complete investigation to delineate the contamination in the former holding pit area. A work plan will be submitted to your office for review and approval before implementation. We, also, shall submit a closure plan for hazardous waste storage and disposal area, to the Ohio EPA as is required by the applicable regulations.

We will call your office to arrange for a meeting to discuss the work plan and the various closure strategies.

Sincerely,

M. N. Maringer

Hazardous Waste
Notice of Violation

May 16, 2000

Mr. Michael Maringer
Manager, Service and Utilities
Campbell's Soup Company
East Maumee Avenue
Napoleon, Ohio 43545

Dear Mr. Maringer:

On March 23, 2000, a meeting between Campbell's and the Ohio Environmental Protection Agency (Ohio EPA) was held at Ohio EPA's Northwest District Office (NWDO). Campbell's was represented by Dr. Osman Aly and yourself. Ohio EPA was represented by Lorma Wendt (DHWM) and myself.

The following information was revealed during the March 23, 2000 meeting:

While responding to an Ohio EPA request for information relating to the Imthurn drum site investigation, Campbell's conducted numerous employee interviews. These interviews led to the discovery of another predicament from Campbell's past.

Campbell's is a manufacturer of soups, sauces, pork and beans, Splash fruit and vegetable juice, and V-8 vegetable juice. Cans were manufactured on-site until July 1998. Coating machines applied a rust inhibitor, similar to an enamel paint, to the 2-piece steel cans to increase durability. The coating machines needed periodic cleaning (performed with solvents classified as both listed and characteristically-hazardous wastes), thus generating hazardous waste.

The coating material waste consisted of two phases; a liquid phase and a sludge-like phase. Approximately 2000 of these drums from the canning plant were stored on-site behind the container plant on a concrete pad. Dr. Aly stated that during the energy crisis of the late 1970s, Mr. Ellis Imthurn approached Campbell's and asked if he could have the drums to use the waste to fuel the boilers in the abandoned school in which he resided. Dr. Aly stated that this was a one-time agreement that concluded in 1979. According to both Dr. Aly and yourself, the drums were simply stored on-site at the Napoleon plant from 1980 to 1981. According to Campbell's, the liquid phase was either burned directly in Campbell's boilers or placed on a coal pile, then burned in the boilers from 1981 to January 1993.

The semi-solid phase of this waste was not amenable to burning. Therefore, too many drums of the combined waste were being generated (you stated that approximately 22 to 100 gallons of the liquid phase waste was poured on the coal pile per month). The liquid phase was siphoned off and burned in the boilers. The semi-solid phase was dumped into two on-site holding pits from 1981 to 1983. The pits were reportedly lined with natural clay that was obtained on-site and compacted prior to placement of any sludges. You stated that the pits totaled approximately 20 feet by 40 feet and were 2½ to 3 feet deep. There was roughly 2 feet of waste in each pit. In 1983, the material was excavated and disposed of at Evergreen Landfill in Northwood, Ohio. The sludge was mixed with sand prior to off-site disposal.

The coating material waste was classified as a hazardous waste because of its ignitability. However, soil sampling data from the former pit area shows concentrations of compounds (xylene, acetone, methyl isobutyl ketone, ethyl benzene, and methyl ethyl ketone) typically found in F-listed hazardous wastes. Material Safety Data Sheets (MSDSs) for the coating materials and solvents used at the Napoleon plant in the early 1980s provided by Campbell's on April 21, 2000, confirms the presence of these materials. Therefore, the materials disposed of in the holding pit were listed hazardous wastes as well.

On December 2 and 3, 1999, HSI GeoTrans conducted sampling at the former holding pit area. The area was identified based on interviews with Campbell's employees. The results of the sampling were presented in a report titled Limited Subsurface Soil Investigation: Former Holding Pit Area received March 23, 2000. The report shows residual volatile organic chemical (VOC) contamination at depths as great as 10 feet below ground surface as a result of Campbell's former waste management techniques.

Because Campbell's has performed unpermitted treatment (evaporation of materials dumped in the holding pits), storage (from 1980 to 1981), and disposal (from 1981-1983) of hazardous waste, they are in violation of the following hazardous waste law:

1. Chapter 3734.02 (E) of the Ohio Revised Code states in part that: "[N]o person shall establish or operate a hazardous waste facility, or use a solid waste facility for the storage, treatment, or disposal of any hazardous waste, without a hazardous waste facility installation and operation permit from the hazardous waste facility board..."

   Campbell's storage of hazardous waste on-site from 1980 to 1981 constitutes unpermitted storage of hazardous waste. Campbell's is a Large Quantity Generator (LQG) of hazardous waste, and may only store waste on-site for ninety (90) days.

   When the semi-solid hazardous wastes were dumped into the holding pits on Campbell's property, they dried and were mixed with sand prior to off-site disposal at Evergreen Landfill in Northwood, Ohio. This evaporation constitutes unpermitted treatment of hazardous waste. The mixing of this material with sand may also constitute unpermitted treatment if the sand were introduced before the waste hardened.

The hazardous wastes dumped into on-site holding pits at Campbell's from 1981 to 1983 also constitutes improper disposal of hazardous waste. Campbell's does not have a RCRA Part B permit allowing for the treatment, storage, or disposal of hazardous waste.

Please respond, in writing, to this Notice of Violation (NOV) within ten (10) days. Your response must include all actions and timetables necessary to demonstrate compliance. *In addition, a copy of the closure plan for the hazardous waste storage and disposal areas must be submitted to Ohio EPA, NWDO within ninety (90) days of receipt of this letter.* Please call me to arrange a meeting to discuss the document entitled Limited Subsurface Soil Investigation: Former Holding Pit Area. The meeting will also be helpful in discussing various closure strategies available to Campbell's.

Failure to list specific deficiencies in this letter does not relieve you from the responsibility of complying with all applicable regulations.

If you have any questions, feel free to contact me at 419-373-3070.

Sincerely,

Michael R. Terpinski

Re: Campbell's Soup
OHD 987023678
OHD 987046703
Hazardous Waste
Henry County
Return to Compliance

December 12, 1994

Mr. Herb Salsbury, Area Manager
Environmental Control
Box 311 State Route 110
Napoleon, Ohio 43545

Dear Mr. Salsbury:

On April 5, 1994, the Ohio Environmental Protection Agency (Ohio EPA) conducted a hazardous waste compliance evaluation inspection of Campbell Soup Company (Campbell's) located in Napoleon, Ohio. This inspection was conducted in order to determine Campbell's compliance with Ohio's hazardous waste generator regulations as adopted under Chapter 3745 of the Ohio Administrative Code (OAC).

During the inspection, violations of Ohio's hazardous waste regulations were noted. Campbell's was notified of these findings in a letter dated April 26, 1994. On May 4, 1994, Campbell's submitted a response to the Agency's Notice of Violation (NOV) containing a timetable for actions to be undertaken to return to compliance for the two cited violations. A second submission from Campbell's was received June 1, 1994. This communication included a proposal from Law Engineering and Environmental Services (Law) for the sampling of the area underlying coal pile which had ignitable hazardous wastes placed on it prior to January, 1993. The Agency responded to this submission in a letter dated June 16, 1994. On September 12, 1994, this office received a revised work plan for the soils underlying the coal pile to which solvent had previously been applied. On September 23, 1994, this office notified Campbell's that the work plan for the sampling of the coal piles appeared adequate.

On December 5, 1994, this office received a copy of Law's site assessment for the coal piles at Campbell's. The results of Law's sampling and analysis indicate that the practice of pouring solvents on one of the coal piles prior to burning the coal in a boiler has not resulted in elevated levels of any solvents poured on the coal pile in the soil underlying that coal pile.

Printed on recycled paper
(revised 12/93)

Because Campbell's has demonstrated that the application of solvent did not impact the soils underlying the coal pile, the violation of ORC Section 3734.02 cited in the April 26, 1994 NOV is considered abated.

Campbell's is considered returned to compliance for all violations cited in the April 5, 1994 NOV.

Campbell's is reminded that the practice of pouring waste solvent on a coal pile prior to the burning of coal in a boiler for the purpose of energy recovery does not meet the requirements of OAC Chapter 3745-58 ("Miscellaneous Methods of Waste Treatment") and must not occur in the future.

Failure to list specific deficiencies in this communication does not relieve you from the responsibility of complying with all applicable regulations.

If you have any questions, feel free to contact me.

Sincerely,

Michael R. Terpinski
Division of Hazardous Waste Management

September 23, 1994

Mr. Herb Salsbury, Area Manager
Environmental Control
Box 311 State Route 110
Napoleon, Ohio 43545

Dear Mr. Salsbury:

On April 5, 1994, the Ohio Environmental Protection Agency (Ohio EPA) conducted a hazardous waste compliance evaluation inspection of Campbell Soup Company (Campbell's) located in Napoleon, Ohio. This inspection was conducted in order to determine Campbell's compliance with Ohio's hazardous waste generator regulations as adopted under Chapter 3745 of the Ohio Administrative Code (OAC).

During the inspection, violations of Ohio's hazardous waste regulations were noted. Campbell's was notified of these findings in a letter dated April 26, 1994. On May 4, 1994, Campbell's submitted a response to the Agency's Notice of Violation (NOV) containing a timetable for when actions were to be undertaken to return to compliance for the two cited violations. A second submission from Campbell's was received June 1, 1994. This communication included a proposal from Law Engineering and Environmental Services (Law) for the sampling of the area underlying coal pile which had ignitable hazardous wastes placed on it prior to January, 1993. The Agency responded to this submission in a letter dated June 16, 1994. On September 12, 1994, this office received a revised work plan for the soils underlying the coal pile to which solvent had previously been applied.

The work plan submitted by Law Engineering and Environmental Services appears to be adequate. Campbell's may proceed with the implementation of this work plan. The Agency requests notification at least 24 hours prior to sampling activities to allow an inspector to observe these activities.

If the pouring of solvents on the coal pile has impacted the underlying soil, closure of this area in accordance with OAC Rules 3745-66-11 through 3745-66-16 will be necessary. Campbell's compliance with respect to the closure requirements will be further evaluated after the analytical results are submitted to Ohio EPA, NWDO.

Printed on recycled paper
(revised 12/93)

The violation of ORC Section 3734.02 cited in the April 26, 1994 NOV remains outstanding until Campbell's can demonstrate that the application of solvent did not impact the soils underlying the coal pile.

Please be advised that failure to comply with applicable hazardous waste rules may be cause for enforcement action by this Agency pursuant to chapter 3734 of the Ohio Revised Code.

Failure to list specific deficiencies in this communication does not relieve you from the responsibility of complying with all applicable regulations.

If you have any questions, feel free to contact me.

Sincerely,

Michael R. Terpinski
Division of Hazardous Waste Management

Hazardous Waste
Henry County
Partial Return to Compliance

June 29, 1994

Mr. Herb Salsbury, Area Manager
Environmental Control
Box 311 State Route 110
Napoleon, Ohio 43545

Dear Mr. Salsbury:

On April 5, 1994, the Ohio Environmental Protection Agency (Ohio EPA) conducted a hazardous waste compliance evaluation inspection of Campbell Soup Company (Campbell's) located in Napoleon, Ohio. This inspection was conducted in order to determine Campbell's compliance with Ohio's hazardous waste generator regulations as adopted under Chapter 3745 of the Ohio Administrative Code (OAC).

During the inspection, violations of Ohio's hazardous waste regulations were noted. Campbell's was notified of these findings in a letter dated April 26, 1994. Campbell's responded to this NOV in letters dated May 4, 1994, June 1, 1994, and June 22, 1994. This letter serves to address Campbell's latest response and to appraise you of the current regulatory status of your facility.

The following violations of Ohio's hazardous waste rules were noted in the April 26, 1994 letter to Campbell's:

1. **Ohio Administrative Code (OAC) Rule 3745-65-33** Campbell's does not test all required spill control, decontamination, fire, and communications equipment in the main plant on a weekly basis.

   On June 22, 1994, this office received a copy of the weekly inspection log showing eight weeks' inspections of Campbell's fire extinguishers. *With this information, this violation is considered abated.*

2. **Ohio Revised Code (ORC) 3734.02(F)** Prior to January, 1993, Campbell's stored and treated ignitable hazardous wastes in a waste pile prior to burning in an on-site boiler without a hazardous waste installation and operation permit or a permit by rule, in violation of ORC section 3734.02(E)(F). Between twenty-two (22) and one hundred (100) gallons per month were poured on the pile and burned.

Campbell's was to obtain samples from beneath the coal pile where solvent was previously poured and from the area beneath the coal pile which was not impacted by this activity. On June 1, 1994, this office received a copy of the sampling strategy proposed by Law Engineering and Environmental Services. Comments to Law's proposed sampling strategy were supplied by the Agency in a letter dated June 16, 1994.

Campbell's is considered returned to compliance for OAC Rule 3745-65-33. The violation of ORC Section 3734.02(F) remains outstanding.

Please be advised that failure to comply with applicable hazardous waste rules may be cause for enforcement action by this Agency pursuant to chapter 3734 of the Ohio Revised Code.

Failure to list specific deficiencies in this communication does not relieve you from the responsibility of complying with all applicable regulations.

If you have any questions, feel free to contact me.

Sincerely,

Michael R. Terpinski
Division of Hazardous Waste Management

Hazardous Waste
Henry County

June 16, 1994

Mr. Herb Salsbury, Area Manager
Environmental Control
Box 311 State Route 110
Napoleon, Ohio 43545

Dear Mr. Salsbury:

On April 5, 1994, the Ohio Environmental Protection Agency (Ohio EPA) conducted a hazardous waste compliance evaluation inspection of Campbell Soup Company (Campbell's) located in Napoleon, Ohio. This inspection was conducted in order to determine Campbell's compliance with Ohio's hazardous waste generator regulations as adopted under Chapter 3745 of the Ohio Administrative Code (OAC).

During the inspection, violations of Ohio's hazardous waste regulations were noted. Campbell's was notified of these findings in a letter dated April 26, 1994. On May 4, 1994, Campbell's submitted a response to the Agency's Notice of Violation (NOV) containing a timetable for when actions were to be undertaken to return to compliance for the two cited violations. A second submission from Campbell's was received June 1, 1994. This communication included a proposal from Law Engineering and Environmental Services (Law) for the sampling of the area underlying coal pile which had ignitable hazardous wastes placed on it prior to January, 1993.

This letter serves to respond to your June 1, 1994 correspondence, and provide the current hazardous waste compliance status of your facility.

The following violations of Ohio's hazardous waste rules were noted in the April 26, 1994 letter to Campbell's:

1. **Ohio Administrative Code (OAC) Rule 3745-65-33** Campbell's does not test all required spill control, decontamination, fire, and communications equipment in the main plant on a weekly basis.

   Campbell's was to begin conducting weekly inspections and submit a copy of one month's inspections to OEPA, NWDO to demonstrate abatement of this violation. In our June 15, 1994 telephone conversation you indicated that this information will be sent soon.

2. **Ohio Revised Code (ORC) 3734.02(F)** Prior to January, 1993, Campbell's stored and treated ignitable hazardous wastes in a waste pile prior to burning in an on-site boiler without a hazardous waste installation and operation permit or a permit by rule, in violation of ORC section 3734.02(E)(F). Between twenty-two (22) and one hundred (100) gallons per month were poured on the pile and burned.

Campbell's was to obtain samples from beneath the coal pile where solvent was previously poured and from the area beneath the coal pile which was not impacted by this activity. On June 1, 1994, this office received a copy of the sampling strategy proposed by Law Engineering and Environmental Services. The following comments are in response to Law's proposed sampling strategy:

a) Sampling of the area underlying the coal pile not impacted by the addition of solvents must be addressed. While there is mention of one soil boring being taken from the east side of the coal storage and mixing area for background characterization purposes, it is not clear whether this sample is to be taken as a background sample for the purpose of comparing the rest of the samples to the other coal pile or to virgin soil.

b) Prior to sampling, a sampling map must be submitted which shows the location of all sampling points for this event.

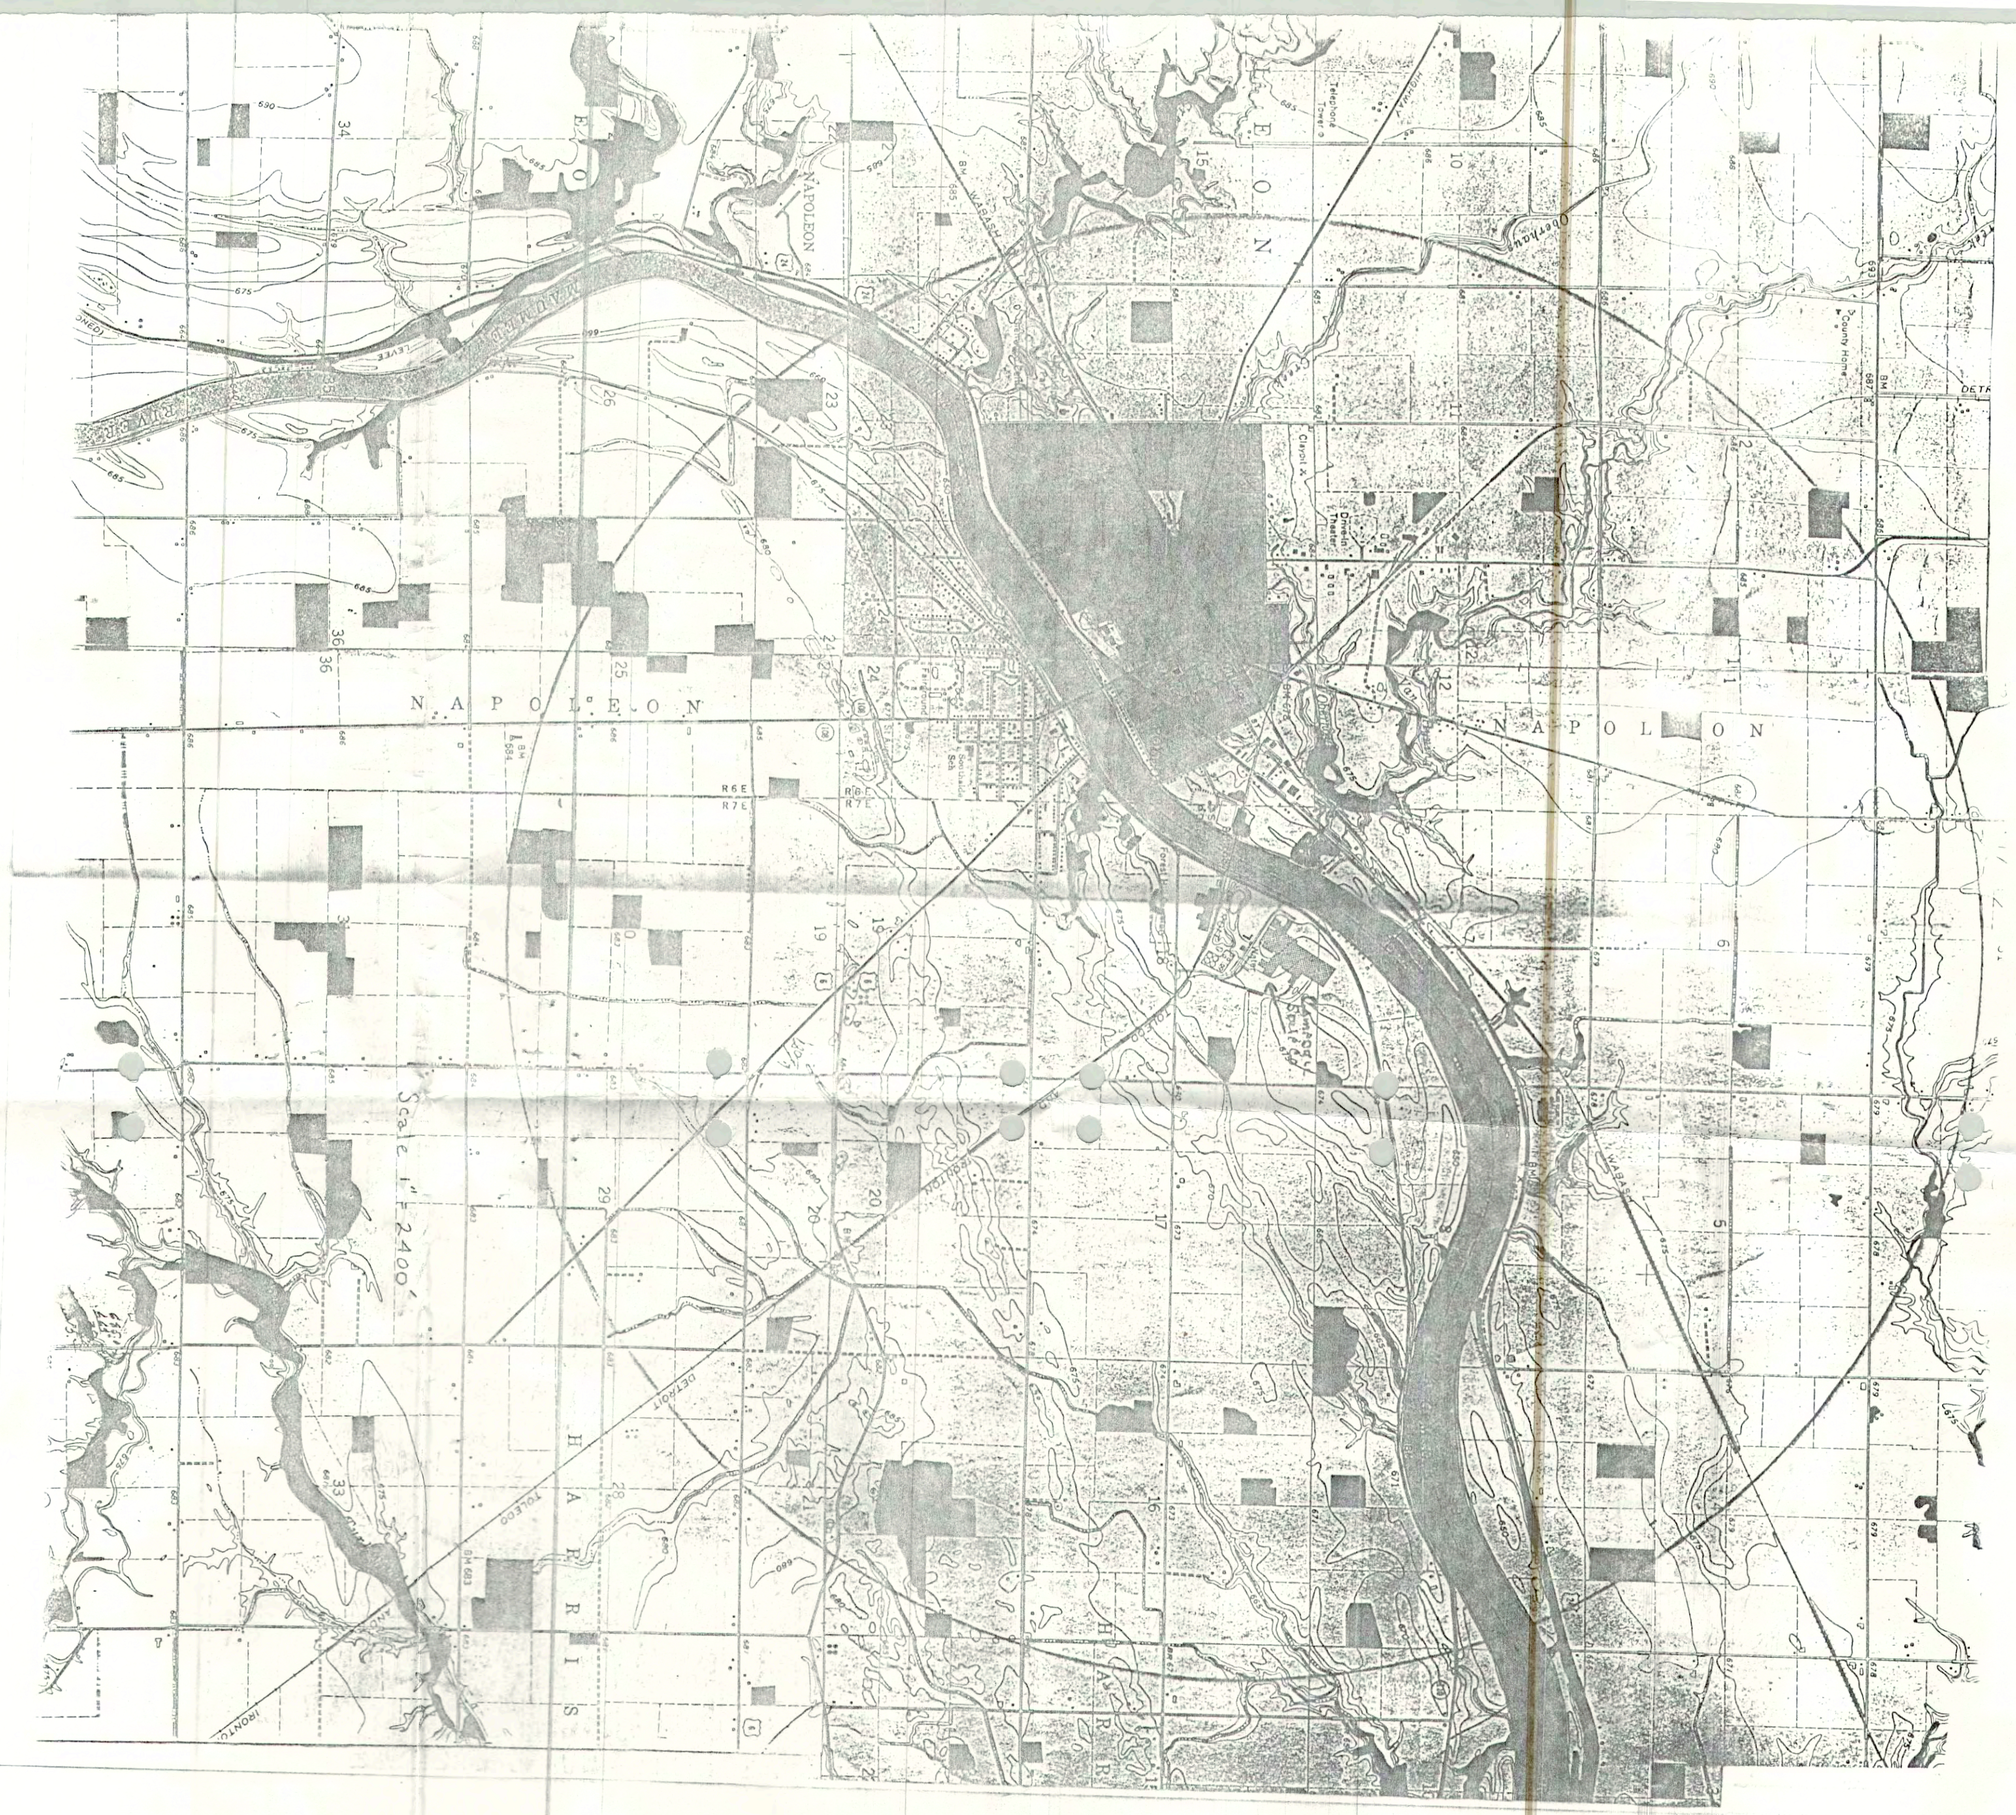
c) The analytical methods for testing soil samples are not stated in the sampling strategy. Campbell's must use USEPA Method 8240 for volatile organic chemicals (VOCs) and USEPA Method 8270 for semivolatile organic chemicals (SVOCs).

If the pouring of solvents on the coal pile has impacted the underlying soil, closure of this area in accordance with OAC Rules 3745-66-11 through 3745-66-16 will be necessary. Campbell's compliance with respect to the closure requirements will be further evaluated after the analytical results are submitted to OEPA, NWDO.

The violations cited in the April 26, 1994 NOV remain outstanding.

Please be advised that failure to comply with applicable hazardous waste rules may be cause for enforcement action by this Agency pursuant to chapter 3734 of the Ohio Revised Code.

Failure to list specific deficiencies in this communication does not relieve you from the responsibility of complying with all applicable regulations.



If you have any questions, feel free to contact me.

Sincerely,

Michael R. Terpinski

Re: File Review Request

The attached items are transmitted as checked below:

☐ For review ☐ Please comment ☐ Urgent
☒ Please Reply ☐ As requested ☐ Approved as noted
☒ Please Recycle ☐ Other:

Please accept this request for information you may have related to the following sites:

Site 6: 1005 E Riverview Ave, Napoleon, Ohio (Parcel #: 28-0700640000)
Site 8: 899 E Riverview Ave, Napoleon, Ohio (Parcel #: 28-0700600000)

I am interested in any files you may have concerning the possible release of hazardous substances or petroleum products on the property, except for indications of releases to the air, which are outside of the scope of this request. In addition, we are looking for records of any "Notice of Intent to Fill" and/or dumping for the above referenced properties. If you have no information pertinent to this site please respond to this request in writing (an email is sufficient).

If you have any questions or require additional information, please feel free to contact me at the office number above and or via email at RSundvold@MannikSmithGroup.com.

Thanks.

(If there are any problems in transmission or I have sent you something in error, please advise).

Confidentiality Statement:
The information contained in this document is intended for the personal and confidential use of the above-named person(s). If the bearer/reader of this message is not said person (or, the employee responsible for delivering facsimiles) then you are notified of erroneous reception of this facsimile and any review, copying, or distribution of this facsimile is prohibited.

File Review Request Checklist

Please Note: Pursuant to Ohio Revised Code 149.43(B)(5), you are not required to fill out this checklist or otherwise provide any public records request in writing. This checklist is intended to help facilitate your public records search by listing the manner in which records are generally maintained by Ohio EPA and accessed in the ordinary course of Ohio EPA's duties.

3. **DIVISIONS AND MAJOR PROGRAM AREAS:**

Division of Air Pollution Control (DAPC):

- ☐ Stack Tests
- ☐ Asbestos Emission Controls
- ☐ Air Permits
- ☐ Open Burning Regulation
- ☐ Ambient Air Monitoring
- ☐ Mobile Sources/Asphalt Plants
- ☐ Toxic Release Inventory
- ☐ Air Nuisance

Division of Surface Water (DSW):

- ☐ Nonpoint Source
- ☐ NPDES/Pretreatment
- ☐ Storm Water
- ☐ Surface Water Permits to Install
- ☐ Sludge Management
- ☐ Water Quality Reports/Watershed
- ☒ Wetland and Stream Permitting (401)

Division of Environmental Response and Revitalization (DERR):

Division of Drinking and Ground Waters (DDAGW):

☒ Emergency Response Incident Reports
☒ RCRA Corrective Action Files
☒ RCRA Groundwater Files
☒ RCRA Closure Files
☒ Voluntary Action Program (VAP) Files
☒ Site Assessments

☐ Monthly Operating Reports (MORs)
☐ Lead and Copper Files
☐ Plan approvals, well logs, etc.
☐ Ground Water Quality Characterization
☐ Underground Injection Control files

Division of Materials and Waste Management (DMWM):

Solid Waste Section:

☒ Construction and Demolition Debris (C&DD)
☒ Scrap Tires
☒ Composting
☒ Open Dumping
☒ Infectious Waste
☒ Municipal Solid Waste Landfills/Incinerators
☒ Municipal Solid Waste Transfer Stations
☒ Residual/Industrial Solid Waste Landfills
☒ Solid Waste Management Planning
☒ Beneficial Use

Hazardous Waste Section:

☒ Cessation of Regulated Operations
☒ RCRA C-Hazardous Waste

☐ **Division of Environmental and Financial Assistance**

4. COMMON PUBLIC DOCUMENT TYPES

☐ Final Permits/Licenses/Authorizations
☐ Inspection Reports/Checklists
☒ Director's Final Findings and Orders
☒ District Office Investigation Reports
☐ Financial Assurance Documents
☐ Water Plant Operator Certifications
☐ Settlement Correspondence
☐ Attorney General Office Referral Letters
☐ Total Maximum Daily Load Reports

☒ Notices of Violation
☒ Emergency Response Incident Reports
☐ Discharge Monitoring Reports (DMRs)
☐ Public Notice/Public Hearing Transcript
☐ Wastewater Operator Certifications
☒ Return to Compliance Letters
☐ Bilateral Compliance Agreements
☐ Environmental Covenants

I am writing to inform you that none of our Ohio Environmental Protection Agency divisions have any information on the two properties located in Napoleon OH at this time.

For your convenience, there are links to other information on our electronic documents (edoc) website that can assist you for your future request.

Please note that on Ohio EPA's website there is more information for each division, such as Division of Drinking and Ground Water (DDAGW), Division of Hazardous and Solid Waste (DMWM), Division of Environmental Response and Revitalization (which includes the first responders for emergency response for spills) (DERR), Division of Air Pollution Control (DAPC), and Division of Surface Water (DSW). Feel free to download the information from our website.

You may find the following information and links helpful in your future request.

- To conduct a search using Ohio EPA's electronic document system (eDocs), follow: http://edocpub.epa.ohio.gov/publicportal/edochome.aspx. Note that eDocs is currently being rolled out, and new documents are being added daily.

- To conduct a search for Division of Air Pollution Control Permits, follow http://extapex.epa.state.oh.us/epaxp/f?p=840:10:2632014501102997.

- Ohio EPA's files on emergency spills/releases are maintained by our Central Office. To request these files, please contact Rich Bouder at richard.bouder@epa.ohio.gov.

- If you suspect that a property has/had underground petroleum storage tank(s), we also recommend that you contact the State of Ohio Fire Marshal's Office, Bureau of Underground Storage Tank Regulation (BUSTR), as they may have additional information on the site. BUSTER may be reached at 614-752-7938.

If you have any further questions regarding this request please do not hesitate to contact me directly at the below information.

Thank you for your request,

Cheryl Gulley, File Review Coordinator
Ohio EPA – Northwest District Office
347 North Dunbridge Road

INTER-OFFICE COMMUNICATION
Office of Environmental Services

TO: Todd M. Audet, District 2 Deputy Director **DATE:** November 4, 2014
Attn: Jennifer Acuna

FROM: Timothy M. Hill, Administrator, Office of Environmental Services

SUBJECT: Environmental Site Assessment Screening

PROJECT: HEN-New Bridge **PID:** 22984

This office has reviewed the Environmental Site Assessment (ESA) Screening for the above referenced project which was produced by The Mannik & Smith Group, Inc.

Based on the information provided, a Phase I ESA is warranted for Site #6 & #8, Rettig, Todd A., Custodian, Route 424, and Site #11, Campbell Soup Supply Co., LLC, SR 110 & CR 12.

If you have any questions or concerns, please contact Juliet Denniss, Environmental Supervisor, at (614) 466-7942.

EXECUTIVE SUMMARY

This Environmental Site Assessment (ESA) Screening Report has been prepared in accordance with the April 2009 *Environmental Site Assessment Guidelines* of the Ohio Department of Transportation's (ODOT's), Office of Environmental Services (OES) to provide sufficient evaluation for developing a list of sites recommended for Phase I ESAs.

The proposed project will construct a new bridge spanning the Maumee River at Napoleon in Harrison Township, Henry County. For many years local officials have recognized the need to better connect the northern and southern halves of the City of Napoleon, which is physically separated by the Maumee River. A single river crossing at State Route 108 currently provides the only direct transportation link between the two halves of the community.

The preferred alternative (Alt 2) would connect Industrial Drive and State Route 424 on the north side of the river with State Route 110 on the south side of the river. Additionally, an alternative route (Alt 3) was evaluated, which would span the river between State Route 424 on the north side of the river and State Route 110 on the south side of the river aligned with County Road 12. The Feasibility Study submitted to ODOT in October 2013 identified Alt 2 as the preferred alternative, and was approved by ODOT on October 31, 2013. While the Study Area covered by this report includes both the preferred alternative and Alt 3, the sites recommended for Phase I Environmental Site Assessments are only those associated with the preferred alternative.

Multiple federal and state environmental databases were reviewed to identify the current or historical use(s) of petroleum or possible hazardous materials within and adjacent to the study area. This ESA Screening included a review of:

- publicly available environmental regulatory databases;
- historical aerial photographs;
- county and/or city mapping;
- United States Geological Survey topographic mapping;
- Ohio Department of Natural Resources Oil and Gas Well maps; and,
- Other agency resources.

FirstSearch Technology Corporation (FirstSearch) compiled a summary of publicly available environmental regulatory database information for the study area and surrounding areas. The database report summarizes each site of potential environmental concern within the study area and a 0.25-mile buffer surrounding the study area. A total of 13 listings comprising five sites were identified on the database search report. Of the five sites identified, none were located within the study area.

ODOT's OES ESA Screening Checklist forms are included in Appendix A. Based upon the findings of this ESA Screening report, The Mannik & Smith Group, Inc. (MSG) recommends the following sites for Phase I ESA:

- Sites #6 & #8, Rettig, Todd A., Custodian, Route 424 (rear), located between the former Miami-Erie Canal and the Maumee River;
- Site #11, Campbell Soup Supply Co., LLC, SR 110 & CR 12;

Site #6 and #8, Rettig, Todd A., Custodian, Route 424 (rear)

This Site was undeveloped at the time of the Site investigation but exhibited a significant amount of fill material. MSG is not aware of the source of the fill material and no evidence of contamination (i.e. odors, sheens, staining) was apparent.

No USTs, ASTs, drums, pond/lagoons, surface staining, sheens, damaged vegetation or odors were observed at the time of reconnaissance. Based on the potential for contamination to be present in historic fill material, a Phase I ESA is recommended for this Site.

Site #11, Campbell's Soup Supply Company, State Route 110 and County Road 12

This Site is developed with a soup manufacturing facility in addition to farmland to the northeast. This Site was identified on the RCRA and SPILLS environmental database. Reportedly, corrective actions were completed on the site from 2006 through 2009, but the nature of these corrective actions is undetermiend.

Drums were located under trees in the farm land and an above-ground storage tank (AST) was identified on the property near the boundary of the study area. No evidence of underground storage tanks (USTs), landfills, ponds / lagoons, surface staining, sheen, damaged vegetation, odors were observed at the time of reconnaissance. Based on the potential release of a regulated material and spills at the facility and lack of information pertaining to corrective actions performed on the site, a Phase I ESA is recommended for this Site.

Appendix D Historical Mapping Documentation
Appendix E Oil and Gas Field Map & Environmental Database Search Report
Appendix F Project Plans
Appendix G Photographic Logs

1.0 INTRODUCTION

The Henry County Transportation Improvement District (HCTID) has authorized a study to evaluate potential environmental concerns associated with the proposed construction of a new crossing of the Maumee River between State Route 424 on the north side of the Maumee River and State Route 110 on the South Side of the Maumee River in Napoleon, Henry County, Ohio. The study area consists of mixed residential, public, agricultural and commercial land uses.

The proposed project will construct a new bridge spanning the Maumee River at Napoleon in Harrison Township, Henry County. For many years local officials have recognized the need to better connect the northern and southern halves of the City of Napoleon, which is physically separated by the Maumee River. A single river crossing at State Route 108 currently provides the only direct transportation link between the two halves of the community.

The proposed project includes construction of a new bridge, piers, abutments and associated approaches to the bridge on both sides of the Maumee River. The preferred alternative (Alt 2) under consideration would connect Industrial Drive and State Route 424 on the north side of the river with State Route 110 on the south side of the river. An additional alternative route (Alt 3) that would span the river between State Route 424 on the north side of the river and State Route 110 on the south side of the river aligned with County Road 12 had been previously under consideration. The Feasibility Study (FS) that was submitted to ODOT in October 2013 identified Alt 2 as the preferred alternative. This FS was approved on October 31, 2013 and Alt 3 was eliminated from further consideration.

The following sections document the study methods and data sources reviewed by MSG in performance of this ESA Screening. Copies of the completed Environmental Site Assessment (ESA) Screening Checklists are presented in Appendix A. A Site Location Map identifying the study area limits is presented in Appendix B. A Study Area Layout showing nearby sites of concern is presented as Appendix C.

2.0 HISTORICAL MAPPING REVIEW

2.1 United States Geologic Survey Topographic Quadrangle Maps

The United States Geological Survey (USGS) 7.5-Minute topographic maps for the Napoleon quadrangle (dated 1960, photorevised in 1977) indicates that the study area is located in a generally flat portion of Henry County. The general elevation of the site ranges from approximately 640 to 680 feet above mean sea level (msl). The Maumee River is located within the study area. The topography of the area implies that shallow groundwater movement is toward the Maumee River. Based on the original map preparation of 1960, the study area appears to have been used for a combination of residential and agricultural purposes. Surrounding land use on this map indicates residential, agricultural and manufacturing land uses.

A copy of the appropriate portion of the USGS map is presented as the Study Area Location Map, which is located in Appendix B.

2.2 County and/or City Road Maps

The study area is located in its entirety within the City of Napoleon, Henry County, Ohio. Henry County has a total land area of approximately 416 square miles with Napoleon being the county seat. No items of suspected environmental concern within the study area were visible on the road maps reviewed.

A copy of the appropriate portion of a road map showing the study area and surrounding roadways and other pertinent features is located in Appendix C. A map showing two alternative proposed bridge rights-of-way (ROWs) is also provided in Appendix C. The two proposed ROWs are indicated by green shading in the figures.

2.3 Aerial Photographs

MSG contacted Historic Information Gatherers, Inc. (HIG) to obtain historical aerial photographs that cover the study area and adjoining sites at a scale no larger than one inch = 500 feet. MSG reviewed and summarized (below) copies of aerial photographs provided by HIG. Copies of the pertinent aerial photographs are provided in Appendix D.

Table 2.1
Summary of Aerial Photograph Review

Year	Study Area Features	Adjoining Site Features	Concern?
1950	The Study Area is depicted as developed with farmland.	The surrounding area is dominated by farmland.	No
1956	The single-family dwelling currently identified as Site #3 is depicted. No other significant changes from the 1950 photograph are observed.	The initial development of the Campbell's Soup Company is depicted southwest of the Study Area. The Henry County Hospital has been constructed in the northeastern corner of the Study Area. No other significant changes from the 1950 photograph are observed.	No
1963	No significant changes from the 1956 photograph are observed.	An expansion of the Campbell's Soup Plant to the northeast is depicted. No other significant changes from the 1956 photograph are observed.	No

Year	Study Area Features	Adjoining Site Features	Concern?
1971	Additional residences were constructed on the north side of the Maumee River. No other significant changes from the 1963 photograph are observed.	Additional expansion of the Campbell's Soup Plant to the northeast is depicted. The Henry County Hospital in the northeastern corner of the study area has expanded. No other significant changes from the 1963 photograph are observed.	No
1980	The multi-family dwelling identified as Site #2 is depicted in this aerial photograph. Additional residences were constructed on the north side of the Maumee River. A commercial building was constructed on the western side of the Study Area.	Additional industrial facilities were constructed north of the railroad tracks. The Henry County Hospital in the northeastern corner of the study area has again expanded. Additional Industrial Facilities have been constructed north of the railroad tracks No other significant changes from the 1971 photograph are observed.	No
1989	No significant changes from the 1980 photograph are observed.	The construction of the final northeastward expansion of the Campbell's Soup Company is depicted. Additional commercial/industrial buildings are seen to the north of the Study Area. No other significant changes from the 1977 photograph are observed.	No
1994	No significant changes from the 1989 photograph are observed.	No significant changes from the 1989 photograph are observed, although the area north of the Study Area experienced additional industrial growth	No
2000	No significant changes from the 1994 photograph are observed.	No significant changes from the 1994 photograph are observed.	No
2004	Sites #6 and #8 are depicted with areas of disturbed earth. No other significant changes from the 2000 photograph are observed.	No significant changes from the 2000 photograph are observed.	Yes – suspected filling at Sites 6 and 8
2009	No significant changes from the 2004 photograph are observed.	No significant changes from the 2004 photograph are observed.	No

2.4 Preliminary Project Mapping and/or Plans

Preliminary project mapping is limited to the Proposed Conceptual Alternative Corridors Figure (IV-1), included in Appendix E.

2.5 Oil and Gas Well Mapping

MSG reviewed the Ohio Department of Natural Resource (ODNR) – Division of Geological Survey Oil and Gas Location Maps that cover the study area. According to the on-line maps reviewed, no oil or gas wells, fields or borings are located within the Study Area. The map indicates the presence of two dry holes within ¼ mile of the study area. These dry holes are not a concern to the Study Area. The nearest oil or gas field is the McClure gas field of the Trenton limestone formation located over nine miles west-southwest of the study area. A copy of the oil and gas map is included in Appendix F.

3.0 REGULATORY DATABASE REVIEW

MSG subcontracted with FirstSearch Technology Corporation (FirstSearch) to review federal and state databases specified in ODOT's April 2009 ESA Screening requirements. A copy of the database report is presented in Appendix F. The following ODOT-specified federal and state databases were reviewed:

Federal

- National Priorities List (NPL);
- Proposed NPL;
- Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS Active);
- CERCLIS-No Further Remedial Action Planned (NFRAP);
- Resource Conservation and Recovery Information System - Treatment, Storage, and Disposal Facilities, (RCRIS - TSD);
- RCRIS - Corrective Action Sites (RCRIS - COR);
- RCRIS - Large and Small Quantity Generators (RCRIS GN);
- RCRIS - Sites No Longer Regulated (RCRIS NLR); and
- Emergency Response Notification System (ERNS);

State

- Ohio Master Sites List (MSL);
- Licensed Solid Waste Facilities (SWF/LF);
- Ohio Leaking Underground Storage Tanks (LUST);
- Ohio Underground Storage Tanks (UST);
- Voluntary Action Program (VAP) Sites

3.1 Database Results Summary

A total of 13 database entries, associated with four sites, were identified to be within the ODOT search distance relative to the study area. Additionally, 11 database entries were reviewed by MSG that were non-geocoded, meaning that FirstSearch was unable to determine the specific locations for these sites. Based on the available address information, MSG has determined that each of the non-geocoded listings are beyond the ODOT-recommended 0.25-mile search radius and are not expected to impact the study area corridor. Additional information about the identified sites is provided in the following sections:

3.2 Study Area-Specific Results

Campbell's Soup Supply Company, located at 12 State Route 110, was identified in the RCRIS database as a facility subject to corrective action under the Resource Conservation and Recovery Act (RCRA-CORRACTS). Three of these listings were reported in the database search.

The first RCRA-CORRACTS listing identified the facility operations as "all other miscellaneous food manufacturing" and was specific to the beverage plant. This listing identifies the facility as a small quantity generator of ignitable waste, corrosive waste, mercury, lindane, methoxychlor, chloroform, dichloromethane (or methylene chloride), and spent non-halogenated solvents. The facility received two "generators – pre-transport" violations in 1994 and one "generators – general" violation in 2003. Each violation resulted in written informal enforcement actions from the Ohio EPA and was resolved in the same year of issue. Corrective actions are reported to have been implemented in 2006 and 2009. The corrective actions were not described in detail in the environmental database report. The lack of information in the environmental report involving corrective actions is considered a significant data gap.

The second RCRA-CORRACTS listing identified the facility operations as "specialty canning and seafood canning" and applied to the soup plant. This listing identifies the facility as a small quantity generator of the same materials discussed in the preceding paragraph. The facility received 15 RCRA violations between 1993 and 2010, nearly all of them related to records/recordkeeping and financial requirements. All violations were resolved by October of 2010. Written informal enforcement actions from the Ohio EPA were drafted in 1993, 2000, and 2003, and 2008(A) compliance was issued and completed in 2000. Corrective action events were initiated in 2006, 2009, and 2010. Corrective action number CA750YE indicates that contaminated groundwater is present at the facility, but migration is under control. The corrective actions were not described in detail in the environmental report. The lack of information in the environmental report involving corrective actions is considered a significant data gap.

The third RCRA-CORRACTS listing identified the facility operations as "testing laboratories." This listing identifies the facility as a conditionally exempt small quantity generator of ignitable waste, methyl ethyl ketone, spent halogenated solvents and spent non-halogenated solvents. The facility received one "generators – pre-transport" and one "Transport, Storage and Disposal (TSD) – closure/post-closure" violation in 1994, both of which were identified as resolved in 1994. Four written informal enforcement actions were submitted by the Ohio EPA in 1994. Corrective actions - were initiated in 2006 and 2009. The corrective actions were not described in detail in the environmental report. The lack of information in the environmental report involving corrective actions is considered a significant data gap.

In 2007, a spill of waste water was reported at this facility address. No additional information regarding the nature or response to the spill was provided in the database report. Based upon the presumed direction of groundwater flow at the Campbell's Soup plant (Northeast, toward the project Study Area), these listings may impact the study area.

Carson Industries, 1675 Industrial Drive, is located near the north edge of the study area boundary and is identified on the RCRIS database as a large-quantity generator of ignitable waste. No RCRA violations were reported in the database. Based on the absence of a recorded release and the distance from the proposed new river crossing project, this site is not expected to be a concern to the study area.

The City of Napoleon Municipal Services Building, 1775 Industrial Drive, is located approximately 590 feet north of the study area. This facility was identified on the UST database with an unspecified number of currently-in-use USTs, and on the LUST databases with three releases, in 2000, 2001, and 2012. Each of these incidents was granted no further action (NFA) status. Based on the presence of the NFA letters and the relative distance, these incidents are not expected to impact the study area.

The City of Napoleon County Road 12 is located on the north east edge of the study area on the northwest side of the East Riverview Avenue and Enterprise Avenue intersection. This Site was identified on the ERNS environmental database with a release of 1,000 gallons of PCBs a regulated material. This site is located within the proposed alternative route (Alt 3) that has been removed from further consideration. Therefore, this site is not recommended for additional investigation.

Based on available information, the remaining listed sites are not expected to impact the study area.

The non-geocoded sites are all outside of the ODOT-recommended search distance of 0.25-mile and are not expected to impact the study area.

4.0 SITE INSPECTION

A total of 43 sites were identified within the study area and were visually evaluated in accordance with ODOT's guidelines. Each of the sites was assigned a unique site number, which corresponds with the numbers on the Site Assessment Checklists in Appendix A. It should be noted; the site numbering system was created solely for this report and does not follow other site identification systems that may be in use. Site inspections were completed by Anthony Rehrmann and by Ari McKeever between September 2012 and April 2013. Site reconnaissance was conducted from public rights-of-way. Each site was inspected for evidence of staining, evidence of UST systems, soil disturbances, drums, surface lagoons, distressed vegetation, or other features that could be indicative of the handling, storage or disposal of petroleum and/or hazardous materials. A photographic log is provided in Appendix G.

Land use in the study area consists of mixed, residential, industrial, and public lands. Observations and characteristics of each site are described below:

Single Family Homes: There are numerous single family residential properties, most of which are located north of State Route 424 (Riverview Road) and south of a set of railroad tracks. None of these single family residential properties were identified within any environmental databases reviewed. No evidence of USTs, ASTs, drums, landfills, ponds/lagoons, surface staining, sheens, damaged vegetation or odors was observed at the time of reconnaissance. Based on the available history of the Sites, no further investigation is warranted. These single family residences include the following:

- Site #3, Drummond, Marvin, 930 East Riverview Avenue; constructed in 1956 (according to the Henry County Auditor's website).
- Site #5, Hauenstein, Todd R., 1005 East Riverview Avenue
- Site #12, Wanemacher, Roger, 12-406 State Route 110
- Site #23, Bockelman, Fredrick C. 954 E Riverview Avenue
- Site #24, Hartman, Patricia L. 968 E Riverview Avenue
- Site #25, Belcher, Wayne C. 980 E Riverview Avenue
- Site #26, Abbott III, Charles D. 994 E Riverview Avenue
- Site #27, Peper, Maureen M. 1012 E Riverview Avenue
- Site #28, Schwaiger, Paul F. 1030 E Riverview Avenue
- Site #29, Scheider Sherrie L. 1048 E Riverview Avenue
- Site #30, Schnitkey Ann C. 1801 Lamar Lane
- Site #31, Wilson, Craig 1811 Lamar Lane
- Site #32, Smith, Ronald E. 1821 Lamar Lane
- Site #33, Vela, Gregory D. 1831 Lamar Lane
- Site #34, Detray, Scott W. 1841 Lamar Lane
- Site #35, Cruz, Robert F. 1822 Lamar Lane
- Site #36, Fruchey Paul N. 1802 Lamar Lane
- Site #37, Mires, Shirlee 1120 E Riverview Avenue

Multi-Family Homes: There are several apartment complexes along State Route 424. These Sites were not identified within any environmental databases reviewed. No evidence of USTs, ASTs, drums: landfills, ponds/lagoons, surface staining, sheens, damaged vegetation or odors was observed at the time of reconnaissance. Based on the available history of these Sites, no further investigation is warranted. Properties with multi-family homes include the following:

- Site #2, Heartland Estates, LLC, 884 East Riverview Avenue
- Site #38, Wurster Properties Inc. 1212 E Riverview Avenue

- Site #39, Wurster Properties Inc. 1140 E Riverview Avenue

Islands: There are several properties located on islands within the Maumee River. There is no access to these properties except by boat. When viewed from the mainland, these properties appeared vacant, and aerial photography shows that when water is high, Bug Island and East Island are submerged; therefore it is unlikely that any permanent structures are located on these islands. No evidence of USTs, ASTs, drums, landfills, ponds/lagoons, surface staining, sheens, damaged vegetation or odors was observed. Based on the available history of these sites, no further investigation is warranted. These island properties include:

- Site #9, Riley, Bruce A., et al, trustees, St. Rt. 424 Rear: This site is an island within the Maumee River and was inaccessible at the time of the site investigation
- Site #13, Bug Island: Based on aerial photographs; when water is high, this island is submerged
- Site #14, Lankenau, Jeffrey R., East Island. Based on aerial photographs; when water is high, this island is submerged

Recreational Land: Remnants of the Miami-Erie Canal are used as a hiking and mountain biking path known as The Buckeye Trail. No evidence of USTs, ASTs, drums, landfills, ponds/lagoons, surface staining, sheens, damaged vegetation or odors was observed. Based on the available history of the Site, no further investigation is warranted. Properties identified as used for trails include:

- Site #4, City of Napoleon, SR 424
- Site #7, Unidentified Owner – Ownership information was not available on the Henry County Auditor's website.

Vacant, Agricultural, or Undeveloped Land: Several Sites are vacant or used for agricultural purposes. These Sites were not identified on any environmental databases. No evidence of USTs, ASTs, drums: landfills, ponds/lagoons, surface staining, sheens, damaged vegetation or odors was observed at the time of reconnaissance. Based on the available history of these Sites, no further investigation is warranted. These undeveloped lands include:

- Site #10, Wyatt, Joann M., St. Rt. 110. This Site was in agricultural production at the time of the Site reconnaissance.
- Site #17, CCS Reality Co. State Route 424
- Site #18, Adair Ltd. State Route 424 Rear
- Site #40, Lankenau Properties I., LTD. E Riverview Avenue

Vacant Land with Evidence of Fill: Two sites, located along the Maumee River, show evidence of filling operations. The source of the fill in undetermined. This land was vacant during site reconnaissance. No evidence of USTs, ASTs, drums: ponds/lagoons, surface staining, sheens, damaged vegetation or odors were observed at the time of reconnaissance. Because the source and characteristics of the fill materials are unknown, Phase I ESA is recommended for both of the following adjacent sites:

- Site #6, Rettig, Todd A., Custodian, Route 424 (rear)
- Site #8, Rettig, Todd A., State Route 424

Industrial Sites: The area, located north of the Maumee Western Railroad and the Campbell's Soup Plant located south of the Maumee River are developed for Industrial Purposes. Each use is described below:

Site #1, Maumee Western Railroad
This site is developed with a single-track railroad but was not identified on any environmental databases reviewed.

No evidence of USTs, ASTs, drums, landfills, pond/lagoons, surface staining, sheens, damaged vegetation or odors was observed at the time of reconnaissance. However, several sidings serving industrial properties north of the tracks were observed. These sidings are outside of the proposed approaches for the spans (Alt 2 and Alt 3). Phase I ESA is not recommended for this site.

Site #11, Campbell's Soup Supply Co., State Route 110 and County Road 12
This site is a food manufacturing facility and includes adjacent fields in agricultural production to the northeast which lie within the Study Area. Campbell's Soup was identified within the RCRA and SPILLS environmental databases reviewed, but the plant lies outside of the study area. No evidence of ASTs, USTs, landfills, ponds/lagoons, surface staining, sheen, damaged vegetation, odors were observed at the time of reconnaissance within the Study Area, but an AST is located immediately south of State Route 110 (Alt 2).

Drums were observed under trees in the agricultural fields. Given the unknown contents of the drums, the AST, and the RCRA and SPILLS database listings for this site, a Phase I ESA is recommended.

Site #15, RDD, LTD., 1675 Industrial Drive
This site is developed as an industrial custom structural foam molding facility. This site was identified on the RCRA environmental database. The Site was identified on the RCRIS database as a large-quantity generator of ignitable waste. ASTs were observed at the south end of the site adjacent to a railroad siding. No evidence of USTs, drums, landfills, ponds/lagoons, surface staining, sheens, damaged vegetation, odors was observed at the time of reconnaissance. Based on the available history of the site and no violations on record, no further investigation is warranted.

Site #16, L & L Properties LTD., 1700 Industrial Drive
This site is developed as an industrial tool, die, gauges, and general machining facility and was not identified in any environmental databases. No evidence of USTs, ASTs, drums, landfills, ponds/lagoons, surface staining, sheens, damaged vegetation or odors was observed at the time of reconnaissance. Based on the available history of the site, no further investigation is warranted.

Site #19, CCS Realty Company. 1800 Industrial Drive
This site is developed as vacant warehouse facility and is vacant and was not identified on any environmental databases. No evidence of USTs, ASTs, drums, landfills, ponds/lagoons, surface staining, sheens, damaged vegetation or odors was observed at the time of reconnaissance. Based on the available history of the site, no further investigation is warranted.

Site #20, Advanced Drainage System. 1075 Independence Drive
This site is developed as a plastic drainage tubing manufacturing facility and was not identified on any environmental databases. No evidence of USTs, ASTs, drums, landfills, ponds/lagoons, surface staining, sheens, damaged vegetation or odors was observed at the time of reconnaissance. Based on the available history of the Site, no further investigation is warranted.

Site #21, CCS Realty Co. 1165 Independence Drive
This site is developed as a dry and cold storage facility and was not identified on any environmental databases.
No evidence of USTs, ASTs, drums, landfills, ponds/lagoons, surface staining, sheens, damaged vegetation or odors was observed at the time of reconnaissance. Based on the available history of the Site, no further investigation is warranted.

Site #22, CCS Realty Co. 1175 Independence Drive
This site is developed with a warehouse facility and was not identified on any environmental databases. No evidence of USTs, ASTs, drums, landfills, ponds/lagoons, surface staining, sheens, damaged vegetation or odors was

observed at the time of reconnaissance. Based on the available history of the Site, no further investigation is warranted.

Site #41, City of Napoleon County Road 12
This site is developed as a public utility power substation and was identified on the ERNS environmental database. According to an aerial photograph review completed by MSG, the site has been a public utility power substation since at least 1963. ASTs were located on the west edge of the site. No evidence of USTs, drums, landfills, ponds/lagoons, surface staining, sheens, damaged vegetation, odors was observed at the time of reconnaissance. This site is located within the proposed alternative route that has been removed from further consideration; therefore, it is not recommended for additional investigation.

Site #42, Toledo Edison Company County Road 12
This site is developed as a public utility substation but was not identified on any environmental databases. According to an aerial photograph review completed by MSG, the site has been a public utility power substation since at least 1956. No evidence of USTs, ASTs, drums, landfills, ponds/lagoons, surface staining, sheens, damaged vegetation or odors was observed at the time of reconnaissance. Based on the available history of the Site, no further investigation is warranted.

Site #43, Imperial Clevite, Inc. 11-800 State Route 424
This site is developed as an industrial automotive parts supplier facility and was identified on the LUST environmental database. No evidence of USTs, ASTs, drums, ponds/lagoons, surface staining, sheens, damaged vegetation or odors was observed at the time of reconnaissance. Based on the potential for contamination from the LUST to be present in addition to the Site's use for industrial manufacturing, a Phase I ESA is recommended for this Site.

Photographs of the study area are included in Appendix G.

5.0 CONCLUSIONS AND RECOMMENDATIONS

This ESA Screening report is presented to document the evaluation of potential hazardous material concerns associated with a proposed Maumee River crossing from Industrial Drive to State Route 110 in Napoleon, Henry County, Ohio. The Study Area consists of mixed residential, public, agricultural and commercial land uses. MSG recommends the following sites associated with the preferred alternative within the study area for Phase I ESA:

- Site #6, Rettig, Todd A., Custodian, Route 424 (rear), located between the former Miami-Erie Canal and the Maumee River;
- Site #8, Rettig, Todd A., State Route 424, located between the former Miami-Erie Canal and the Maumee River.
- Site # 11, Campbell's Soup Supply Company., State Route 110 and County Road 12

Sites #6 and #8, Rettig, Todd A., Custodian, Route 424 (rear)
These sites were undeveloped at the time of MSG's site investigation but a significant amount of fill materials of undetermined origins and characteristics were observed.

Site #11, Campbell's Soup Supply Company, State Route 110 and County Road 12
This site is developed as a food manufacturing facility in addition to farmland to the northeast of the plant. The site was identified on the RCRA and SPILLS environmental database. Several drums with unknown contents were located under trees in agricultural land associated with this site as was an AST with unknown contents. Reportedly, the site has undertaken corrective actions associated with a closure/post-closure violation from 2006 through 2009, but the nature and characteristics of the corrective actions are undetermined..

Notice of Disclaimer

Due to the limitations, constraints, inaccuracies and incompleteness of government information and computer mapping data currently available to FirstSearch Technology Corp., certain conventions have been utilized in preparing the locations of all federal, state and local agency sites residing in FirstSearch Technology Corp.'s databases. All EPA NPL and state landfill sites are depicted by a rectangle approximating their location and size. The boundaries of the rectangles represent the eastern and western most longitudes; the northern and southern most latitudes. As such, the mapped areas may exceed the actual areas and do not represent the actual boundaries of these properties. All other sites are depicted by a point representing their approximate address location and make no attempt to represent the actual areas of the associated property. Actual boundaries and locations of individual properties can be found in the files residing at the agency responsible for such information.

Waiver of Liability

Although FirstSearch Technology Corp. uses its best efforts to research the actual location of each site, FirstSearch Technology Corp. does not and can not warrant the accuracy of these sites with regard to exact location and size. All authorized users of FirstSearch Technology Corp.'s services proceeding are signifying an understanding of FirstSearch Technology Corp.'s searching and mapping conventions, and agree to waive any and all liability claims associated with search and map results showing incomplete and or inaccurate site locations.

Environmental FirstSearch Descriptions

NPL: ***EPA*** NATIONAL PRIORITY LIST - The National Priorities List is a list of the worst hazardous waste sites that have been identified by Superfund. Sites are only put on the list after they have been scored using the Hazard Ranking System (HRS), and have been subjected to public comment. Any site on the NPL is eligible for cleanup using Superfund Trust money.
A Superfund site is any land in the United States that has been contaminated by hazardous waste and identified by the Environmental Protection Agency (EPA) as a candidate for cleanup because it poses a risk to human health and/or the environment.
FINAL - Currently on the Final NPL
PROPOSED - Proposed for NPL

NPL DELISTED: ***EPA*** NATIONAL PRIORITY LIST Subset - Database of delisted NPL sites. The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.
DELISTED - Deleted from the Final NPL

CERCLIS: ***EPA*** COMPREHENSIVE ENVIRONMENTAL RESPONSE COMPENSATION AND LIABILITY INFORMATION SYSTEM (CERCLIS)- CERCLIS is a database of potential and confirmed hazardous waste sites at which the EPA Superfund program has some involvement. It contains sites that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL.
PART OF NPL- Site is part of NPL site
DELETED - Deleted from the Final NPL
FINAL - Currently on the Final NPL
NOT PROPOSED - Not on the NPL
NOT VALID - Not Valid Site or Incident
PROPOSED - Proposed for NPL
REMOVED - Removed from Proposed NPL
SCAN PLAN - Pre-proposal Site
WITHDRAWN - Withdrawn

NFRAP: ***EPA*** COMPREHENSIVE ENVIRONMENTAL RESPONSE COMPENSATION AND LIABILITY INFORMATION SYSTEM ARCHIVED SITES - database of Archive designated CERCLA sites that, to the best of EPA's knowledge, assessment has been completed and has determined no further steps will be taken to list this site on the National Priorities List (NPL). This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.
NFRAP – No Further Remedial Action Plan
P - Site is part of NPL site
D - Deleted from the Final NPL
F - Currently on the Final NPL
N - Not on the NPL
O - Not Valid Site or Incident
P - Proposed for NPL
R - Removed from Proposed NPL
S - Pre-proposal Site
W – Withdrawn

RCRA COR ACT: ***EPA*** RESOURCE CONSERVATION AND RECOVERY INFORMATION SYSTEM SITES - Database of hazardous waste information contained in the Resource Conservation and Recovery Act Information (RCRAInfo), a national program management and inventory system about hazardous waste handlers. In general, all generators, transporters, treaters, storers, and disposers of hazardous waste are required to provide information about their activities to state environmental agencies. These agencies, in turn pass on the information to regional and national EPA offices. This regulation is governed by the Resource Conservation and Recovery Act (RCRA), as amended by the Hazardous and Solid Waste Amendments of 1984.
RCRAInfo facilities that have reported violations and subject to corrective actions.

RCRA TSD: ***EPA*** RESOURCE CONSERVATION AND RECOVERY INFORMATION SYSTEM TREATMENT, STORAGE, and DISPOSAL FACILITIES. - Database of hazardous waste information contained in the Resource Conservation and Recovery Act Information (RCRAInfo), a national program management and inventory system about hazardous waste handlers. In general, all generators, transporters, treaters, storers, and disposers of hazardous waste are required to provide information about their activities to state environmental agencies. These agencies, in turn pass on the information to regional and national EPA offices. This regulation is governed by the Resource Conservation and Recovery Act (RCRA), as amended by the Hazardous and Solid Waste Amendments of 1984.
Facilities that treat, store, dispose, or incinerate hazardous waste.

RCRA GEN: ***EPA/MA DEP/CT DEP*** RESOURCE CONSERVATION AND RECOVERY INFORMATION SYSTEM GENERATORS - Database of hazardous waste information contained in the Resource Conservation and Recovery Act Information (RCRAInfo), a national program management and inventory system about hazardous waste handlers. In general, all generators, transporters, treaters, storers, and disposers of hazardous waste are required to provide information about their activities to state environmental agencies. These agencies, in turn pass on the information to regional and national EPA offices. This regulation is governed by the Resource Conservation and Recovery Act (RCRA), as amended by the Hazardous and Solid Waste Amendments of 1984.
Facilities that generate or transport hazardous waste or meet other RCRA requirements.
LGN - Large Quantity Generators
SGN - Small Quantity Generators
VGN – Conditionally Exempt Generator.
Included are RAATS (RCRA Administrative Action Tracking System) and CMEL (Compliance Monitoring & Enforcement List) facilities.
CONNECTICUT HAZARDOUS WASTE MANIFEST – Database of all shipments of hazardous waste within, into or from Connecticut. The data includes date of shipment, transporter and TSD info, and material shipped and quantity. This data is appended to the details of existing generator records.
MASSACHUSETTES HAZARDOUS WASTE GENERATOR – database of generators that are regulated under the MA DEP.
VQN-MA = generates less than 220 pounds or 27 gallons per month of hazardous waste or waste oil.
SQN-MA = generates 220 to 2,200 pounds or 27 to 270 gallons per month of waste oil.
LQG-MA = generates greater than 2,200 lbs of hazardous waste or waste oil per month.

ERNS: ***EPA/NRC*** EMERGENCY RESPONSE NOTIFICATION SYSTEM (ERNS) - Database of incidents reported to the National Response Center. These incidents include chemical spills, accidents involving chemicals (such as fires or explosions), oil spills, transportation accidents that involve oil or chemicals, releases of radioactive materials, sightings of oil sheens on bodies of water, terrorist incidents involving chemicals, incidents where illegally dumped chemicals have been found, and drills intended to prepare responders to handle these kinds of incidents. Data since January 2001 has been received from the National Response System database as the EPA no longer maintains this data.

Tribal Lands: ***DOI/BIA*** INDIAN LANDS OF THE UNITED STATES - Database of areas with boundaries established by treaty, statute, and (or) executive or court order, recognized by the Federal Government as territory in which American Indian tribes have primary governmental authority. The Indian Lands of the United States map layer shows areas of 640 acres or more, administered by the Bureau of Indian Affairs. Included are Federally-administered lands within a reservation which may or may not be considered part of the reservation.
BUREAU OF INDIAN AFFIARS CONTACT - Regional contact information for the Bureau of Indian Affairs offices.

State/Tribal Sites: ***OH EPA*** DIVISION OF EMERGENCY AND REMEDIAL RESPONSE DATABASE(DERR) - database of basic information regarding name and status in the Voluntary Action Program, for potentially contaminated sites that are maintained by district offices in Ohio.

State Spills 90: ***OH EPA*** SPILL LOCATIONS - database of spills reported to the Ohio Environmental Protection Agency since 1990.

State/Tribal SWL: ***OH EPA*** WASTE FACILITIES - The Database of all Compost and Demolition Debris, Industrial and Residual Waste, Municipal Solid Waste Landfills and Municipal and Solid Waste Transfer Facilities are maintained by the Division of Solid and Infectious Waste Management.

State/Tribal LUST: ***OH FMO*** FACILITIES WITH ACTIVE RELEASES FROM REGULATED TANKS - database of leaking underground storage tanks reported to the Ohio Fire Marshal's office.

State/Tribal UST/AST: ***OH FMO*** LIST OF ACTIVE REGISTERED FACILITIES - database of all registered underground storage tanks.

State/Tribal VCP: ***OH EPA*** BROWNFIELD INVENTORY (Subset)- database of sites that have voluntary submitted information to the inventory as part of the Site Assessment and Brownfield Revitalization Program (SABR) and over seen by the Voluntary Action Program .

State/Tribal Brownfields: ***OH EPA*** BROWNFIELD INVENTORY - database of sites that have voluntary submitted information to the inventory as part of the Site Assessment and Brownfield Revitalization Program (SABR).

RADON: ***NTIS*** NATIONAL RADON DATABASE - EPA radon data from 1990-1991 national radon project collected for a variety of zip codes across the United States.

State Other: ***US DOJ*** NATIONAL CLANDESTINE LABORATORY REGISTER - Database of addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the U.S. Department of Justice ("the Department"), and the Department has not verified the entry and does not guarantee its accuracy. All sites that are included in this data set will have an id that starts with NCLR.

State Other: ***OH EPA*** WASTE FACILITIES SUBSET - database of all Compost Facilities, Infectious Waste, Scrap Tire Facilities, and Transfer Stations. The database also includes a historical Master Site Listing of all Hazardous Waste Inventory Sites.

FI Map Coverage: ***PROPRIETARY*** FIRE INSURANCE MAP AVAILABILITY - Database of historical fire insurance map availability.
